SWAINSONIA GALEGIFOLIA. — This species and its varieties purpurea and alba are useful for training up the sides of a section of the greenhouse. They can be grown quickly, and will cover a large space even when the roots are confined in pots of moderate size. Use a compost of loam, leaf-soil, and sand, and supply with liquid manure when the pots have become filled with roots. Cuttings made from the young growths will root freely at the present time if inserted in sandy soil and the cutting pots placed on a mild hotbed.

ZONAL PELARGONIUMS.—For flowering in winter the plants that are now going out of bloom should be cut back, and the cuttings inserted for the purpose of raising a stock to bloom next winter. If it is desired to keep the old plants, the roots must be kept moderately dry until new shoots are formed about two inches in length. At that stage the roots should be shaken out of the old soil and repotted, using for this purpose a compost of loam, leaf-mould, and sand, with a sprinkling of bone-meal. In potting the soil should be rammed firmly round the sides of the pot as this gives fine short growth and a free production of flower trusses. Pinch off all flower buds that appear during the summer, and early in the autumn. Freely ventilate the house, as it is essential the shoots should become well matured.

CELOSIA PYRAMIDALIS.—The earliest of these will now be developing their plumes, therefore a selection should be made of the best. Choose those of a strong habit, and discard all those that exhibit weak, straggling growth or washy and undecided colours. Shift the selected plants into 6 inch pots, and use a compost, consisting of two parts turfy loam, one part leaf-mould, one part well-decayed manure, and a moderate proportion of sand. Return to a light structure, and place near the glass, giving each specimen plenty of room to develop its side shoots and acquire a perfectly pyramidal form. Syringe night and morning, taking care to thoroughly wet the underside of the leaves to dislodge red spider, a pest to which celosias are very susceptible. A rather warm temperature at the commencement will be the most conducive to a vigorous growth. Admit air early in the day, and close the ventilators early in the afternoon to conserve the sun heat. If large specimens are required select the best examples when ready for a further shift, and put them into 7 and 8 inch pots, in which size very fine specimens may be cultivated; after the plumes are fully developed cooler and drier atmospheric conditions will be advisable.

BULBS.—Such as narcissi, tulips, hyacinths, etc., that were forced into flower early should not be thrown away, as they can be again utilised. Clear them out of the boxes and pots, and plant on a spare piece of ground in the garden where they will flower the following spring; the same applies to spiræas, if left in the ground for a couple of years they can again be lifted for forcing.—W. Staward, Belford Hall Gardens, Northumberland.

THE FLOWER GARDEN.

HERBACEOUS BORDERS.—Most of the plants are above ground. Vacant places may be filled up with violas, antirrhinums, hollyhocks, campanulas, foxgloves, or other suitable plants that may be at hand and to spare. Any bare spaces near the margins might be sown with suitable annuals, or later on filled with dwarf-growing asters or stocks.

HARDY BEDDING PLANTS might be put into their permanent quarters forthwith, and so assist in keeping pace with the work to be done at the general planting-out time; sedums, cerastiums, saxifrages, and similar plants might be so dealt with. Borders that have remained vacant throughout the winter months should be suitably manured and roughly dug, and so left to the ameliorating influences of wind and weather until planting-out time.

TENDER BEDDERS that have made sufficient growth for the time being should now be removed from the fruit or other houses, where the usual atmosphere is too moist or the temperature too high. It very often happens that for want of space at this time of the year bedding plants suffer by being overcrowded, and have to be transferred to a temporary unheated shelter all too soon. Where this becomes an absolute necessity nothing must prevent the plants being nightly covered until all danger from frost is past. A sudden change in the wind, even though the glass is high, might mean a corresponding and sudden drop in the temperature and a frost before morning. If the supply is short there is still time to strike cuttings of lobelia, ageratum, or other quick-growing subjects. Tender subtropical plants such as castor oils should be kept growing and transferred to larger pots as may become necessary. Tuberous-rooted begonias that have been started in boxes should be potted up singly, and kept steadily growing for another three weeks or more to ensure compact healthy plants, as only such will produce an effective display later on.

SUMMER-FLOWERING CHRYSANTHEMUMS that have been kept steadily growing in cold frames might soon be planted out, but before doing so the ground—if not already done—should be deeply dug and well manured. When planting see that each is fixed firmly in the soil, and should the latter be at all dry, or it be requisite, water well as the work progresses.

ROSES on walls or in sheltered positions that are making rapid growths should be carefully watched for green-fly, and as soon as the pest makes its appearance the trees should be well syringed with an approved and suitable insecticide. All the leading growths that are in danger of being broken or damaged should first of all be made secure.

BORDER CARNATIONS and PINKS may need some protection from sparrows and other birds, otherwise the leading growths might be seriously injured by them. Where netting is impossible, or may be deemed unsightly, spray the plants with a strong solution of quassia and soft soap as often as may be necessary until they cease their attacks.

GENERAL WORK to a large extent consists in the preparation for summer arrangements. Mowing, sweeping, cutting, and clipping of grass verges and edgings, preparing beds and borders for planting, pruning and tying up or nailing in climbing plants requiring attention, and the dressing with soot or wood ashes any portions of the lawn that have a sickly hue. Paths that require turning or regravelling might receive attention during showery weather, after which they should be well rolled and the surface made smooth and firm. Paths that are becoming moss-grown or weedy in appearance should be dressed—where practicable—with an approved weed-killer during fine weather.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

APHIS, OR GREEN-FLY, will soon become a source of trouble to fruit growers, and a sharp lookout should be kept upon the growths of all the kinds of fruit trees that are subject to the attacks of this pest. Plums, peaches, nectarines, and cherries are the most liable to the attacks of green-fly, and where it is found to be present trees should be immediately syringed with quassia extract, or some other approved insecticide. At this season of the year, the young growths being very tender, two or three weak applications are preferable to one strong one, which will often injure the leaves, and cause them to drop off. If the weather is mild, it should be applied in the evening, and the trees syringed early next day with soft tepid water to clean the foliage; if, on the other hand, cold nights prevail, the spraying should be done on a fine day, so that the foliage may become dry before night.

BLACK-FLY.—Cherries are subject to the attacks of this pest, and the trees should be carefully watched for its presence, which can easily be discerned by the curled leaves, which form a fine harbour for the fly. Tobacco powder may be used for slight attacks, dusting the affected parts several times, until the insects have been eradicated, and giving the trees a good syringing with tepid water. Where severe attacks of black-fly have to be dealt with the trees should be syringed with a well-prepared nicotine wash, taking care to wet the foliage thoroughly. It must be borne in mind that spraying operations should not be undertaken until the trees have set their fruits.

LEAF-CURL IN PEACHES AND NECTARINES.—This is common in some localities on the foliage of these trees when grown on the walls outside, and usually makes its appearance when the material used to protect the blossoms has been removed. Leaf-curl is caused by a fungus, and all affected leaves should be removed and burnt as soon as possible, and, in the case of a bad attack, the trees should be lightly syringed with a weak solution of potassium sulphide.

GENERAL WORK.—Disbudding peach and nectarine trees should be proceeded with gradually, this operation being governed by the conditions of the weather and the development of the young growths. This season vegetation has been very slow up to the present time, and plenty of patience must be exercised when proceeding with this work. Apricots will require many of their shoots to be pinched within a short time hence to encourage them to form fruit spurs for next season. Where these trees have been well protected from recent frosts they have set far too many fruits, therefore the worst placed and smallest should be removed as soon as possible. Attend to the removal of the protecting material from wall trees as soon as the blossoms have fallen. Cherries and pears in full flower will require to have protecting material placed over them. The same careful attention should be given these two kinds as that usually received by peaches and nectarines.—Henry R. Farmer, Card Castle Gardens.

COLOUR IN BLACK GRAPES.

The season of 1909 was not a good one for the grape grower. In the first place many vines were flowering early in June when the sun was obscured for more than a week, and the weather, generally, was cold. Usually, when the flower bunches are gently tapped a cloud of pollen falls out, and then ascends through and around each bunch, but in my own case I saw very little pollen, though I had a good "set" of berries, the houses being kept warm and dry.

After the cold spell there followed a fortnight of intense heat at the beginning of August, just when many grapes were stoning, and very liable to scald. Free ventilation and some shading were necessary in order to save the berries from damage. Following on all this we had a cold, sunless autumn, with constant showers of rain, and I was surprised to see, in different parts of the country, grapes so well coloured.

But I chiefly wish to refer to several bunches of Alicante which grew close to the roof glass—within six inches of it, which position could not be avoided under the circumstances. Except when the berries were stoning, these bunches were practically exposed to the sun's rays throughout the season. One bunch had full exposure, with a north-east aspect, and it was the best-finished bunch of all, the berries being large, even, and bearing a dense bloom. Instead of being first suffused with colour, the berries were deeply streaked with dark red; the streaks deepened, and soon joined, and at the end of twenty-one days the berries were finished. When a lighted candle was held behind the berries no red tinge could be seen. In some other bunches, which had a fair canopy of large main leaves over them, a little of the objectionable red could be seen.

Now I know that black grapes usually colour best under a suitable covering of leaves, and also retain their colour in such circumstances; and I would not like to advocate the full exposure of the bunches similar to the one I have referred to, but the way in which the bunch progressed and finished has impressed me, and I hope to experiment further; also I should be glad to know what the experience of other growers has been in this connection. Of course, I remember the weather conditions during 1909, and such full exposure in a normal summer may be disastrous to any bunches so exposed.

Geo. Garner.

ROYAL SHOW

PRACTICE WITH SCIENCE

LIVERPOOL,
June 21st to 25th, 1910.

71st ANNUAL EXHIBITION of Live Stock, Poultry and Farm Produce; Jumping, Horse-Shoeing and Butter-Making Competitions, Agricultural Education, Forestry and Horticulture.

HORTICULTURE
ENTRIES CLOSE ... JUNE 4.
Live Stock Entries close May 20;
Poultry Produce and Competitions, May 31.

Prize-sheets and Entry Forms will be forwarded on application to
THOMAS McROW, Secretary.

Royal Agricultural Society of England,
16, Bedford Square, London, W.C.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Huntingdon Daffodil Society.

The Huntingdon Daffodil and Spring Flower Society is something more than a local affair, because the classes it provides are, with one exception, open to all England, that is to say they are open to all but nurserymen and trade growers. A neat little schedule of twenty-nine classes is provided, sixteen of these being devoted entirely to daffodils. Miss L. L. Linton is the energetic secretary, and no fewer than eight members of the Linton family are hearty supporters of the society. Fairly good prizes are offered, these, in several instances, coming from the traders, i.e., Messrs Robert Sydenham, Lim., Birmingham; Messrs. Barr and Sons, Covent Garden; Mr. J. Cooper, Lissadell, Sligo; and Messrs. R. H. Bath, Lim., Wisbech.

The exhibition was again held in the Corn Exchange, Huntingdon, and the competition throughout was keen, and the flowers in excellent condition. The Corn Exchange is not large enough, neither is it light enough to display the flowers to fullest advantage, but everything possible in the way of tiered and draped staging was provided, and a very effective show resulted. There was a large attendance directly after the opening hour, and some little time before this arrived judging was concluded, and the prize cards all placed in position ready for the visitors. The Huntingdon Society is only four years old, but, thanks largely to Miss Linton's efforts, it has made wonderful progress, and greatly increased the cultivation of daffodils in the district.

The Barr Cup, offered for the best collection of thirty varieties, in bunches of not fewer than three or more than nine flowers of each, was won by J. Cator, Esq., M.P., Woodbastwick Hall, Norfolk, with a magnificent set of varieties, nine blooms in each vase; the very best were Shakespeare, Queen of Spain, Glory of Leiden, Minnie Hume, Ariadne, King Alfred, Mdme. de Graaff, Gloria Mundi, Victoria, Mrs. Betteridge, and M. J. Berkeley. There were five competitors, and second prize fell to S. F. Staffurth, Esq., Frieston Priory, Boston, for a delightfully well-set-up set, consisting of three or four flowers of a variety; his Gloria Mundi was superb; Miss Linton, Stirtloe House, Buckden, was second with a well-staged collection of clean, medium-sized blooms; Lady Lilford, Lilford Hall, Oundle, was awarded a special prize.

Lady Lilford led for three vases of distinct poet's varieties, with lovely solid flowers of Horace, Cassandra, and Homer; J. Marshall, Esq., second, and H. R. Darlington, Esq., Park House, Potter's Bar, third. Lady Lilford secured first prize for six large-crowned varieties, in as many vases, winning with clean, fair-sized specimens of Golden Bell, Mdme. de Graaff, Glory of Leiden, Emperor, Maximus, and Duke of Bedford; H. R. Darlington, Esq., second, and T. Longland, Esq., Warboys, Huntingdon, third.

J. Marshall, Esq., Hartford Cottage, Huntingdon, led for six vases of Incomparabilis and Leedsi varieties with Crown Prince, Gloria Mundi, Lucifer, Katherine Spurrell, Fairy Queen, and Lady Godiva; H. R. Darlington, Esq., second, his Seagull and Albatross being very good; Mrs. Stables, Offord Hall, Godmanchester, third. J. Marshall, Esq., also led for six poeticus varieties with a delightful set of Laureate, Virgil, Almira, Homer, Epic, and Cassandra; Miss Olive Linton, Buckden, was a close second, and Lady Lilford third.

The best three vases of poetaz varieties came from Miss Irene Linton, Buckden, who showed Triumph, Irene, and Aspasia in first-rate condition; Miss Louise L. Linton second, and Mrs. Towgood, Farm Hall, Godmanchester, third.

The best large-crowned daffodil was a bloom of Glory of Leiden, exhibited by Rev. O. P. Fisher, Graveley Rectory, Huntingdon, and S. F. Staffurth, Esq., second, with Weardale Perfection. There were eleven competitors in the class for the best single bloom of a medium-crowned variety, and here Lady Lilford scored with a fine flower of Diana, F. Staffurth, Esq., following with Evangeline, and J. Linton, Esq., Buckden, third, with Strongbow. Mrs. Nowell-Ustiche, Philleigh, Cornwall, scored for one parvi-coronata variety with a good bloom of Diana; J. Linton, Esq., second with Dante.

Miss Louise L. Linton annexed the premier award for three vases of Leedsi varieties, winning with White Lady, Katherine Spurrell, and Fairy Queen; Miss Linton second, and Miss Joan Linton third, the latter having a pretty vase of Water Witch. Mrs. Towgood scored for three double varieties with Sulphur Phœnix, Golden Rose, and Orange Phœnix; Miss Irene Linton and H. R. Darlington, Esq., second and third respectively.

There were no fewer than a dozen entries in the class for four vases of daffodils, any varieties, and here J. Marshall, Esq., scored with Glory of Leiden, Madame de Graaff, Autocrat, and Gloria Mundi; Mrs. Stables, Offord Hall, second; and T. Longland, Esq., third. There were also a dozen entries in the county class for six vases of distinct varieties, J. Marshall, Esq., scoring with fine examples of Glory of Leiden, Almira, Surprise, Minnie Hume, Madame Plemp, and Sir Watkin; Mrs. Carnegy, Alconbury, Huntingdon, second; and Mrs. Senior, Brampton Park, Huntingdon, third.

In the classes for polyanthuses, primroses, violets, and spring flowers the leading prize-winners were Mrs. Baumgartner, Island Hall, Godmanchester; Mrs. Pope, Pertenhall, St. Neots; Mrs. Linton, Buckden; Mrs. Towgood; Lady de Ramsey (a fine set of perpetual carnations); Rev. H. S. Bridge, Brampton; and Mrs. Senior.

Non-competitive displays of high quality were made by several of the nurserymen. Messrs. J. R. Pearson and Sons, Lowdham, had a particularly fine lot of daffodils, in which Romance, Florence Pearson, Magnate, Lowdham Beauty, Homespun, Uncle Robert, and Scarletta were conspicuous. Messrs. Barr and Sons, Covent Garden, and Messrs. Cartwright and Goodwin brought along the best of their flowers from Westminster, where they displayed them the previous day. Lovely perpetual carnations and cut roses were finely set up in large bunches by Messrs. Laxton Brothers, Bedford. Messrs. R. H. Bath, Lim., Wisbech, had excellent daffodils, their Crystal Queen, Argent, King Alfred, Fireflame, Refulgence, Brilliancy, and Great Warley figuring conspicuously.

Mr. J. E. Perkins, Hunts, had, in a miscellaneous group, splendid examples of Tausendschon rose, Veronica Hulkeana, and Clematis montana rubens. Another miscellaneous display came from Messrs. W. and J. Brown, Peterborough. Mr. J. Mallender, of Blythe, Notts, sent some beautiful flowers of old and new daffodils, and new seedlings.

Ipswich.

On Thursday, April 21, the Ipswich Society held its Daffodil and Spring Flower Show in the Corn Exchange, and this proved a spacious, light, and in every way more suitable place than the old venue. A capital lot of daffodils were forthcoming, and the modern, refined, and red-cupped varieties were shown more extensively than on any previous occasion, and this made the show much more interesting. If the society would arrange for tiered staging on the occasion of its next spring show it would be better for the flowers and for the visitors.

The competition was fairly good, and the attendance of members and visitors early in the afternoon of a beautiful spring day was excellent.

DAFFODILS.

In the only trade class for forty-eight varieties of daffodils, three blooms of each, there was only one entry, and this from Major W. O. Cautley, was awarded a second prize, probably because the flowers were a trifle small, and in many cases the blooms were splashed with rain; Gloria Mundi, Glitter, Weardale Perfection, White Lady, Vesuvius, and Seagull were all well represented.

Premier award for two dozen varieties, three blooms of each, fell to Mr. A. Sparke, gardener to F. L. Bland, Esq., Rookwood, Copdoc, Ipswich, whose back row consisted of very fine examples of Lucifer, Emperor, Seagull, White Lady, Mdme. Plemp, and Albatross; other good things were Crown Prince, Lulworth, and Mdme. de Graaff; Mr. H. G. Strutt, gardener to W. P. Burton, Esq., Edgehill, Belstead Road, was a good second, his Glory of Leiden, Emperor, and Golden Spur, being excellent. The best dozen varieties were set up by Mr. F. H. Fieldgate, who had Sir Watkin, Barri conspicuus, and Glory of Leiden in good colour; Mr. S. Farrow, gardener to Mrs. Luther Holden, Pinetoft, Rushmere, second.

A charming set of twelve narcissus, single flowers, came from Mr. Bland, and secured for him the first prize in the class; his blooms were clean and perfect, and the varieties were White Lady, King Alfred, Albatross, Lucifer, Lady M. Boscawen, Will Scarlet, Fusilier, Mdme. de Graaff, Oriflamme, Asterdente, Sequin, and Amyas Leigh; Mr. W. P. Burton second, and Mr. Fieldgate third. Mr. Burton was placed first for three vases of bicolor daffodils in a keen competition, his varieties being Empress, Victoria, and Mdme. Plemp; Mr. Bland had to be content with second place, and Mr. R. Dow was third.

Mr. Bland scored for three vases of incomparabilis varieties with Orangeman, Gloria Mundi, and Lucifer, all very bright; Mr. D. C. Warnes, second, and Mr. Burton third. Mr. Bland led for three Barri varieties, showing elegant examples of Crown Prince, Albatross, and Seagull; Mr. Burton second.

For three Leedsi varieties, Mr. Bland was again to the fore with Salmonetta, White Lady, and M. B. de Graaff; Mr. Burton second. Mr. Bland was the only exhibitor of poeticus varieties, three vases, and here he had beautiful blooms of Almira, Horace, and Rosetti. Mr. Bland also scored for Burbidgei varieties.

The class for a dozen blooms of Sir Watkin was a fine one, the numerous entries making a fine display; Mr. R. Death, Capel St. Mary, was first with bright fresh flowers; Mr. J. E. Grant, gardener to W. H. Burroughes, Esq., Burlingham, Ancaster Road, second; and Mr. D. C. Warnes third.

Twelve blooms of Barri conspicuus was another fine class, and here the awards fell in order to Messrs. Burroughes, Warnes, and Dow, who all showed well. Twelve blooms of any one variety brought out numerous entries, and here Mr. Burton led with Golden Spur; Mr. Burroughes second with Mdme. Plemp, and Mr. Warnes third with Mdme. Plemp.

In the amateurs' section for daffodils Mr. E. H. Buxton, Mr. Bradbury, Mr. J. Edgar, and Mr. V. D. Colchester were leading prizewinners, Mr. Bradbury showing a splendid White Lady.

MISCELLANEOUS.

Miscellaneous groups were not of particularly high merit, overcrowding being the great fault. Mr. Burton led with a bright arrangement of azaleas, spiræas, lilacs, cinerarias, etc.; Mr. J. H. Southgate, Spring Road, second, and Mr. V. D. Colchester, Henley Road, third, the latter showing large cytisuses and clivias. Six bunches of spring flowers from the open air proved a good class, and here Mr. Dow took leading honours with Crown Imperials, Empress Daffodils, fine wallflowers, forget-me-nots, polyanthuses, and Keizer Kroon tulips; Mr. W. C. Moses, gardener to W. F. Paul, Esq., Orwell Lodge, second, and Mr. L. Holden third.

There were five half-dozens of Cineraria stellata, and the best set came from Mr. F. Whitaker, gardener to C. B. Cowell, Esq., St. Margaret's, Tuddenham Road. Mr. Dow had the best six florists' cinerarias out of a very moderate set of five exhibits. Mr. Paul had the best three deutzias, and he scored in the classes for calceolarias with a really magnificent set, and also led for schizanthuses.

Mignonette, six pots, secured a first prize for Mr. Paul, and it was finely grown. There was a close fight between Mr. Dow and Mr. Colchester for first place for six pots of tulips, but awards were made to them in the order of their names, the former having rather the larger blooms; Mr. Burroughes third. Messrs. Colchester, Dow, and Burroughes took the awards, as placed, for three pots of daffodils.

In the ladies' classes there were some pretty displays, consisting of bowls, vases, and bouquets of daffodils and other flowers, and the leading prizewinners were Miss Snell, Anglesea Road; Miss A. Harwood, St. Peter's Street, Colchester; Mrs. E. Butcher, Upper Brook Street; Mrs. Judge, London Road; Mrs. D. C. Warnes, and Mrs. G. Hempson, Springe Vale, Sproughton.

TRADE DISPLAYS.

Mr. R. C. Notcutt, Ipswich, displayed a fine large group of forced flowering shrubs, lilacs, and mollis azaleas being the chief features, but the exhibit lacked a neat marginal finish. Messrs. B. R. Cant and Sons, Colchester, had a charming lot of roses, Rose du Barri, Fortune's Yellow, and Elizabeth, figuring conspicuously. Mr. F. Lilley, Guernsey, brought over some fine daffodils, notably White Lady, Broad Wings, Gloria Mundi, Argent, and Don Quixote.

Messrs. R. Wallace and Co., Colchester, had a pretty set of hardy primulas, and Messrs. Bakers, Wolverhampton, sent aubrietias, and saxifragas, while Mr. C. Buck, Ipswich, had floral designs, carnations, etc., and decorated the doorway of the Corn Exchange with big bunches of daffodils.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—April 19.

Present: Mr. E. A. Bowles, M.A., F.F.S., F.L.S. (in the chair), Dr. A. B. Rendle, F.R.S., Messrs J. Fraser, J. Douglas, A. Worsley, J. T. Bennett-Poë, W. Hales, W. Fawcett, E. M. Holmes, R. Hooper Pearson, and F. J. Chittenden (hon. sec.).

THE LATE MR. G. S. SAUNDERS.—The members heard with deep regret of the death of Mr. G. S. Saunders, F.L.S., who had for many years been a regular attendant at the meetings of the Committee, and who had acted as entomological referee. It was resolved that a vote of condolence should be conveyed to Mr. Saunders's relatives, the resolution being carried by the members in silence, upstanding in their places.

A FOUR-MERONS NARCISSUS.—Mr. Chittenden showed, on behalf of Mr. Murray Thompson, a flower of Narcissus "Sir Watkin," having eight perianth pieces, eight stamens, and a four-celled ovary with four-lobed stigma. The multiplication of parts in narcissus flowers is frequent, but this specimen showed the multiplication very regularly.

INFERTILE CINERARIA.—Mr. Worsley drew attention to a blue flower cineraria which he found among others in his garden with the stamens developed, but containing no pollen.

INTERMITTENT VARIEGATION.—Mr. Bowles read a communication from Canon Ellacombe concerning variegation in Sedum telephium. This plant had produced leaves variegated with pink in his garden in 1908, and a piece of the plant was placed in Mr. Bowles's garden, where, also, it grew variegated. In 1909, however, in both gardens the shoots were wholly green, but this year again, in both gardens, they were coming variegated. Other examples of intermittent variegation were mentioned, most occurring when the plant in question had been placed under different conditions from that in which it generally grew, and it was considered that variegation depended largely upon the environmental conditions acting upon the plant, as well as an innate tendency to produce variegated foliage.

Norfolk and Norwich Spring Flower Show.

The array of narcissi at this exhibition was very good indeed, beside which there were many classes for various cut flowers, pot plants, and vegetables.

There were four entries in the class for a circular group of flowering and foliage plants, and here Mr. Andrews, gardener to Captain Meade, Earsham Hall, had the distinction of winning the challenge cup with a pretty group.

Mr. George Davison, gardener to Colonel Petre, Westwick House, Norwich, was the winner in the most important classes for narcissi, viz., thirty-six varieties, three blooms each; and twelve varieties, all trumpet types. Mr. Davison has been working away at the large trumpet section for many years, and the result of his labours was shown in the seedlings he exhibited. These were respectively named **Juliana, Unicorn, Edmund, Charlemagne,** and **Dumpy.** They all, with the exception of the latter, possess beautifully-frilled trumpets and wide perianths, and from an exhibitor's point of view, are most attractive.

Mr. A. Woodhouse, gardener to Sir H. Cozens Hardy, Letheringsett Hall, also staged exceptionally good blooms in both these classes. Mr. Frank Neave, Lingwood, won the bronze medal for the best dozen blooms grown by an amateur enthusiast. Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham Park, staged some fine examples of flowers from the hardy garden, and in his stand of twelve bunches, for which he took first prize, were to be seen such charming things as gentians, primulas in variety, and Trillium grandiflora. He won first also with anemones, staging four distinct types. As an "inside" grower he won first for twelve bunches of exotic flowers, and first for six orchids, in pots or pans, beating Mr. Rider Haggard's gardener, who, nevertheless, had a fine batch. Carnations were another fine feature, and those staged by Mr. W. Laws, gardener to G. E. White, Esq., Eaton, Norwich, were indeed fine examples, especially the blooms of Marmion; Mr. W. Allan (Gunton) had a nice lot of flowers in this section.

Mr. Frank Neave was first for polyanthuses, with trusses of immense size and beauty. Tulips were only a moderate display. Violets were a strong class, doubles predominating. The pot plants were in every case splendid examples of cultural skill. Dr. Thomson, Thorpe, and Mr. F. Williams, gardener to Louis Tillett, Esq., Catton, both staged splendid mignonette, cyclamen, too, were good from Dr. Osburne's garden. Schizanthuses, cinerarias, calceolarias, azaleas, and amaryllis were all on view from the best local growers.

Fruits were represented only by strawberries, the best coming from Mr. U. Wright, gardener to W. J. Birkbeck, Esq., Stratton, and those in pots from Mr. F. Williams, gardener to Louis Tillett, Esq. The best lot of vegetables was a fine collection staged by Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead House.

The trade growers contributed their quota to the show. Messrs. Daniels Bros., Lim., Norwich, had a magnificent group of forced shrubs, roses in pots, and cut blooms; Messrs. Hobbies, Lim., Dereham, made a feature of roses grown in pots; Mr. G. W. Miller, Clarkson Nurseries, Wisbech, made a feature of orchids with a stand of profusely-flowered plants, odontoglossums being especially good.

The general appearance of the exhibits was in advance of former years, and it is pleasant to record that the public appreciated the efforts of the Norfolk and Norwich Horticultural Society to keep this show going by turning up in larger numbers than usual.

The Horticultural Club.

OLD FRENCH FLORAL LITERATURE.

At the usual monthly dinner of this club, held at the Hotel Windsor under the chairmanship of Mr. W. A. Bilney, on Tuesday, the 19th, Mr. C. Harman Payne delivered a very interesting address on "French Floral Literature prior to 1800." Considering the comparative paucity of floral material which was available for the floriculturist at that time, the lecturer pointed out the curious fact that a very large number of writers treated of such flowers as were in vogue, which included our still familiar friends:

Carnations.
Cyclamen.
Anemones.
Pæonies.
Roses.
Ranunculus.
Tulips.
Hyacinths.
Crown Imperial.
Antirrhinums.
Balsams.
Poppies.
Foxgloves.
Marigold.
Daisies.
Lily of the Valley.
Pansies.
Wallflowers.
Lilac.
Rosemary.
Sunflower.
Passion Flower.
Jessamine.
Amaranth.
Auricula.
Everlasting Pea.
Marvel of Peru.
Primrose.
Crocus.
Narcissus.
Tuberose.
Iris.
Lilies.
Orchids.
Aquatics.

A by no means insignificant list. These were treated on lines which in many cases must have involved great expense, and yet, as surviving examples prove, ran into numerous editions, and held their own in some cases for many decades. These works appear practically to have formed the main foundation of English floricultural literature at that time in the form of translations, and as many of them gave long lists of the names of the flowers concerned, they are of intense interest to such flower lovers as are not contented with the mere study or culture of the plants themselves, but also desire to know their origin and pedigree and history generally.

It is noteworthy that much of the data of that time was collected by ecclesiastics whose avocation permitted them to pursue such studies systematically, while it is clear that at that epoch the wealth and stability (real or assumed) of the French Court and aristocracy permitted of the [illegible] ful support being given to encourage [illegible] publication of their records on liberal [illegible] By comparison, the English floral literature of the same period was insignificant. [illegible] dentally the lecturer lamented that our public libraries, even that of the British Museum, involved no collection of old floral literature of this class, though abroad they could be found well represented, and he expressed the hope that the Royal Horticultural Society would do something in this connection with relation to the Lindley Library and their own contemplated additions thereto.

In the subsequent discussion, in which Messrs. Bilney, May, Druery, Walker, Sanders, Cook, and Jeffries took part, Mr. May, adverting to the lecturer's allusion to the salutary influence of the expatriated Huguenots on British floriculture, said that, as a youth he recollected seeing tulips and other flowers carefully cultivated at Spitalfields, where these exiles largely settled, founding in that locality the silk-weaving industry, which they imported together with their floral knowledge. Mr. Druery, while fully appreciating the lecture from the bibliographical point of view, considered from his own experience of ancient fern literature, that it was of little or no use as a practical guide to culture nowadays, too often consisting of myth and fable and a multitude of synonyms, the great bulk of which had long since been discarded. Mr. Sanders and Mr. E. T. Cook, as representing the business side of floricultural literature, pointed out that books on such flowers as the ranunculus, which Mr. Payne regretted no longer appeared, would not possibly pay nowadays, a theme which Mr. Bilney summed up by pointing out that in the old days such special treatises as had been described constituted the sole resource of would-be cultivators, while to-day they were kept fully informed day by day by a competent horticultural Press at next to no expense at all. He, however, fully recognised, as did the rest of the audience, that the historical side of floriculture was of absorbing interest, and he most heartily congratulated Mr. Payne on the way in which he had brought the fact home to his hearers, on whose behalf he thanked him cordially.

Bournemouth Gardeners' Association.

On April 19 a very interesting and instructive lecture was given by Mr. G. H. Heath, Glenfallock Gardens, Bournemouth, on "The Cultivation of Primula sinensis."

The lecture was short, but full of useful hints, and a good general discussion followed, nearly all the members taking part. Mr. Heath exhibited twelve primulas, and was deservedly awarded a first-class certificate. A similar award was made in the case of mignonette and schizanthuses in pots; they were very fine indeed. These were shown by Mr. Tompkins.

Mr. Heath's primulas were of large size, named varieties, and included the Giant, as well as older types. The trusses and individual flowers were of good average size, especially considering the lateness of the season, and the fact that some of the plants commenced to flower six months ago, and had continued to do so up to the present time.

The following are the chief points of the lecture. Mr. Heath makes two sowings for his purpose; the first early in March, and the second in May. The seeds are sown in a mixture of loam, leaf-soil, and sand, and the pans placed in a temperature of 60 deg. The soil is kept regularly moist, and is shaded from bright sunshine. In June all the plants are removed to a cold frame. From the seed pans the seedlings are transplanted into shallow boxes, Mr. Heath being a firm believer in obtaining a mass of fibrous roots, spreading out every way, in preference to a few roots penetrating deeply. The lecturer preferred transplanting to early potting separately in small pots, on account of the necessity for constant watering in the latter case. The potting compost recommended was loam two parts, leaf-soil one part, and decayed manure one part, with a small quantity of old mortar rubble and sand to keep the whole porous. Mr. Heath said he potted his plants firmly and rather low down; the leaves were not buried, but allowed to rest on the soil. From the boxes he potted the plants into 60's, then shifted them into 48's, and finally into 32's. After the first potting had been done, he always took care to shift the plants directly the roots touched the sides of the pots.

Careful watering, said the lecturer, was essential to success. If the soil was kept too wet the plants soon collapsed, and if it was allowed to get dry several times the plants lost some of their leaves. In very hot weather Mr. Heath advised syringing early in the morning. Throughout July, August, and September the plants made rapid growth, and in settled weather he said he removed the lights at night, as the dew was very beneficial. In September the plants were removed from the frames to a warm house.

At the close of the discussion, hearty votes of thanks were accorded the lecturer and Mr. Garner, who presided.

Birmingham Gardeners' Association.

The last fortnightly meeting of the association took place on April 18, when an average number of members attended, and were presided over by Mr. Thomas Humphreys (the chairman). It was "Question Night," and this has ever possessed a special interest for the debaters. Another interesting matter was the consideration of the annual outing fixture, but, as nothing was definitely settled, this was delegated to a sub-committee to bring up for approval at the general meeting.

The questions were numerous, and of special moment was that pertaining to the reason why certain varieties of peaches and nectarines were more prone to mildew and "blister" than others. It was suggested that as the petioles of the leaves had no glands, and the leaves were serrated, while, on the other hand, such varieties as Grosse Mignonne, with the leaves crenated and glands globose, are not so liable to mildew. The conditions necessary for the development of mildew was considered to be the unequal degree of moisture existing between the atmosphere of the house and the medium in which the roots are growing; for instance, if the border be kept abnormally dry, and the atmosphere of the house close or moist for a few days, the foliage will speedily mildew, while cold currents of air also favour the "blister." Another puzzling problem was why the fruits of tomatoes sometimes fail to ripen perfectly owing to the presence of peculiar greenish-coloured blotches that affect the epidermis and relative portions of the flesh. There was more than one opinion that it was caused by frequent syringings and sun-burnings. It was also suggested that the symptoms evidenced a lack of some constituent in the soil, probably potash, necessary for the perfect ripening of the fruit. The most suitable soil or loam for the culture of carnations, and the most efficient insecticide for the destruction of red-spider were debated, and one of the best for the latter purpose was considered to be XL-All, if used in a comparatively dry atmosphere.

Reading and District Gardeners' Association.

The last meeting of the Spring Session was held in the Abbey Hall on April 18, the president (Mr. Alderman Parfitt, J.P.) occupying the chair.

There was a very large company present, including a number of lady visitors, when, by request of the members of the association, Mr. T. J. Powell, of The Gardens, Park Place, Henley-on-Thames, gave a practical demonstration in the art of arranging cut flowers in vases, bowls, etc. Mr. Powell prefaced his demonstration with the remark that the more natural the flowers can be made to appear when cut, the more pleasing is the effect to the eye. His arrangement in bowls of magnolias, Cydonia japonica, spiræas, narcissi, and roses called forth much praise, as also did his vases of schizanthus, shrubby spiræas, and Forsythia suspensa, but the climax was reached when he decorated an overmantel with narcissi and again with roses. Mr. Powell having answered several questions, a hearty vote of thanks was accorded him for a most interesting and instructive evening; and Messrs Bracher and Sydenham were also heartily thanked for so kindly lending the silver bowl and vases, and Mr. Phillips for the loan of tables and cloths.

As this was the evening set apart as "The Annual Hospital Night," a magnificent display, comprising over a hundred bunches of cut flowers, was made, consisting of arums, arabis, berberis, cinerarias, deutzias, geraniums, myosotis, narcissi (in variety), Pyrus japonica, polyanthus, ribes, spiræas, schizanthus, wallflowers, etc. Those contributing were Messrs. Abraham, Barnes, Bailey, Blackwell, Brooker, Boxall, Carter, Dix, Dore, Durrant, Eggleton, H. Goodger, Garlick, R. A. Hatton, Hinton, Judd, Lees, Newman, Neve, W. J. Townsend, F. Townsend, Tunbridge, Tovey, Procter, Powell, Nichols, Reeves, Skeet, Wynn, and Wilson.

A collection was also taken on behalf of the Royal Berkshire Hospital, and the sum of £3 8s. 6d. was realised. On the next morning the flowers were conveyed to the Berkshire Hospital.

Bristol Gardeners' Association.

The annual meeting was held on April 21 at St. John's Parish Rooms, when Mr. S. Shaddick presided over a large attendance. Mr. J. Scott read the annual report, followed by the financial statement, both of which were satisfactory, from whatever position viewed.

The society is now standing on a firmer basis than at any time in its history. Colonel Carey Batten was re-elected president; Mr. Hayball was chosen as chairman; and Mr. Albert Perry as vice-chairman for the new session. Messrs. J. Scott and H. Woodward were re-elected hon. secretary and treasurer, and assistant secretary respectively. Messrs. Coombs and Extence were also re-elected librarian and registrar. Four new members were elected.

It was reported that several young men had made a full attendance for the session. Mr. Shelton won the silver medal for the highest number of points. For six vases of daffodils, Messrs. Scott and Woodward won respectively, and Messrs. Binfield and Spry were equal third. Mr. Gostling won three points, and Mr. Curtis two for orchids. Messrs. Garaway were awarded a special certificate for six large plants of their giant strain of schizanthus. Mr. Thoday also had a special for a very fine amaryllis.

Croydon Gardeners' Society.

There was a large attendance at the Sunflower Temperance Hotel on Tuesday, when Mr. J. Watson, B.Sc., of Redhill, lectured upon "Leaves."

After quoting Ruskin, to the effect that "Leaves take all shapes, as if asking us to examine them," the lecturer proceeded to exhibit some splendid lantern slides, and by their means he was able to convey to his audience the structure of the leaf. In examining this structure of a transverse section he showed it was composed of the upper and lower epidermis or skin, and between these the cells through which passes the food of the plant taken up by the root system. The flow of moisture passing through the tissues is in excess of the plant's requirements, and this excess is passed into the air we breathe through pores in the leaf, called stomata. The stomata serve a double purpose, for while they allow this escape of moisture, they admit also the carbon dioxide, which is chemically broken up by the chlorophyll or green colouring matter in the leaf. This process helps us to comprehend the economy of nature. The arrangement of the leaves on a plant in the most favourable position to get sunlight is another point to be considered by the observer. Another study is the adaptation of the leaves of a plant to its environment, and an example of this was illustrated by the water crowfoot. The part of the plant growing above the water has broad leaves, whilst those submerged are of much finer substance. In the cacti there is an illustration of a different arrangement; for many months cacti are without water at the roots, and Nature has ordained methods of retention of moisture to serve, and leaves to a plant of this kind would be a positive danger to its welfare. The thistle furnishes an illustration of flower protection, the thorny structure being so arranged to prevent ants and other insects climbing up to rob the flower of nectar.

The proposal of a very hearty vote of thanks to Mr. Watson received unanimous support from the audience. Mr. O. Jeal, Waddon Lodge Gardens, staged half a dozen cabbages, Sutton's Early April, which were much admired.

FORTHCOMING ENGAGEMENTS.

SATURDAY, April 30.—Brussels International Exhibition, Flower Show; four days.

TUESDAY, May 3.—Royal Horticultural Society; Daffodil and Tulip Committee, at 11.30 a.m.; Fruit, Floral, and Orchid Committees at 12 o'clock; lecture at 3 o'clock, on "Future Forest Trees," by Dr. A. Henry, M.A., V.M.H.; Scientific Committee, at 4 p.m.

National Auricula and Primula Society, at the Royal Horticultural Hall.

Scottish Horticultural Association.

British Gardeners' Association Council Meeting.

WEDNESDAY, May 4.—National Auricula and Primula Society, Midland Section, at Birmingham Botanical Gardens.

THURSDAY, May 5.—Linnean Society Meeting.

SATURDAY, May 7.—French Horticultural Society of London.

MONDAY, May 9.—United Horticultural Benefit and Provident Society.

WEDNESDAY, May 11.—East Anglian Horticultural Society.

Royal Society of Arts.

THURSDAY, May 12.—British Gardeners' Association. London Branch.

FRIDAY, May 13.—Devon County Show at Exmouth.

TUESDAY, May 17.—Royal Horticultural Society; Fruit, Floral, Orchid, and Tulip Committees meet at 12 o'clock; lecture at 3 p.m. on "The Tulip: Problems and History," by the Rev. Joseph Jacob; Scientific Committee at 4 o'clock.

National Tulip Society's Show, to be held at Royal Horticultural Hall.

THURSDAY, May 19.—Perpetual Flowering Carnation Society, at Royal Horticultural Hall.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

BLUE PRIMROSE.—B. T., Swindon: The flowers sent are very beautiful, the shade of violet-blue being specially attractive. Carefully seed the plant, and make a rigid selection from the resulting seedlings, with a view of increasing the size and substance of the flowers. Increase the original plant by division, and use plenty of leaf-mould in the soil provided for the divisions.

FIGS IN EARLY VINERY.—J. W., Yarmouth: The figs are not likely to be a great success under the conditions to which they are at present subjected. The plants receive too much shade from the fast-growing vines, and this shade increases as the need of light becomes more and more imperative. Further, figs planted out are not suitable for early forcing, because the stems become active before the roots; figs in pots, the latter plunged in leaves or other suitable material and given a little bottom heat are easily forced. It is also probable that the planted-out figs have too deep and rich a root run, but lack of light, coupled with early forcing, are the chief causes of failure in regard to the first crop, and this is proved by the fact that the second crop of figs comes fairly good later in the season, when there is more light and little artificial heat.

A SHAKESPEAREAN GARDEN.—J. C., Wavertree: Shakespeare refers to a very large number of plants in his plays, and it is from these that a selection is made for a Shakespearean garden. You will probably leave the vegetables out altogether, but flowers, herbs, and many of the trees could be grown without any great difficulty. The design of the garden is a matter of taste; we incline to the view that it should be of formal plan, and surrounded by a yew hedge, with walks radiating from a central old-fashioned sun-dial. The following are the trees and shrubs referred to by Shakespeare: Almond, apple, apricot, ash. Aspen (Populus tremula), bay, Bilberry (Vaccinium myrtillis), birch, blackberry, box, briar, broom, cedar, cherry, chestnut, cork, cypress, damson, Dewberry (Rubus cæsius), dogberry (probably Cornus sanguinea), Eglantine (sweet briar), elder, elm, fig, filbert, furze, gooseberry, hawthorn, hazel, heather, holly, honeysuckle, ivy, laurel, lavender, lime, marjoram, medlar, mistletoe, mulberry, myrtle, oak, peach, pear, Pine (Pinus sylvestris), plane, plum, pomegranate, quince, rose, rosemary, rue, sycamore, thyme, vine, walnut, willow, Wormwood (probably Artemisia abrotanum), and yew. We have omitted the tropical kinds that it would be useless to plant out of doors.

MOSCHOSMA RIPARIA.—G. G. B. C., Alnwick: This plant is a shrubby member of the order Labiatæ, and comes from South Africa. It has been grown for several years at Kew, and proved a useful winter flowering subject. It was exhibited by two firms of nurserymen on January 6, 1904, before the Royal Horticultural Society, and received an Award of Merit. The flowers are quite small individually, but they are carried in long, plumose, spiræa-like spikes, and as they are white they produce a very graceful effect, and good plants are very suitable for association with gaily-coloured flowers in the conservatory. After the plants have finished flowering they should be cut back, placed in a warm greenhouse, and watered sparingly. After a few weeks of this treatment they will commence to break into new growth, and should then be placed in a warmer house where there is a moist atmosphere. The new growths will soon develop here, and when they are three inches long these should be removed with a heel of old wood and inserted singly in small pots, or several in a 48-sized pot. Over gentle bottom heat in a close pit these cuttings quickly root, and they must be potted up as soon as fit. When established, place them on a shelf in an intermediate house, and pot again as necessary. During the summer Moschosma riparia will need very little artificial heat, and a greenhouse or brick frame will afford sufficient protection, returning them to the warm greenhouse in September. During the earlier stages of growth pinch out the growing points twice to induce a bushy habit; if pinched more often a larger plant may be secured, but the spikes will be small. Moschosma riparium must never lack moisture at the roots from the time the cuttings are rooted until the flowers have faded. Weak liquid manure may be given after the plants have become well-rooted in their flowering pots, and 48 or 32 sized pots are sufficiently large. Sound loam, sand, and a little leaf-soil or old mushroom bed manure makes a suitable compost for Moschosma riparium.

WEEDS IN LAWNS.—E. C. P., Newbury: Failing the tedious business of hand-weeding the lawn, you had better use one of the lawn sands advertised in our columns. Nitrate of soda will encourage many of the weeds and strong grasses. Superphosphate is a capital dressing for lawns in the spring especially if mixed with sulphate of ammonia at the rate of three parts of the former with one part of the latter, using about 1lb. per square rod. One such dressing at the end of February, and another from the middle to the end of April, will work wonders upon a lawn that has been neglected.

SHAKESPEARE'S FLOWERS. — J. C., Wavertree: The following are the chief flowers referred to by Shakespeare: Aconite (Aconitum napellus), anemone, Bachelor's Button (possibly Ranunculus acris fl.-pl.), Balm (Melissa officinalis), barley, bread beans, bulrush, Burdock (Arctium lappa), Burnet (Poterium sanguisorba), Camomile (Anthemis nobilis), carnation, clover, cockle or cornflower, columbine, corn, cowslip, Crow-flower (Lychnis flos-cuculi), Crown Imperial, Cuckoo-buds (Cardamine pratensis), daffodils, daisy, Darnel (Lolium temulentum), dock, Eringoes (Eryngium maritimum), fennel, fern (hardy), flax, Flower-de-Luce (iris), fumitory, Harebell (Scilla nutans), hemlock, Holy Thistle (Carduus benedictus), hyssop, Knot-grass (Polygonum aviculare), Lady-smocks (Cardamine pratensis), Lark's Heel (Larkspur or delphinium), lily, Long Purples (Orchis mascula and O. maculata, or, possibly, Lythrum salicaria), mallow, Mandrake (Mandragora vernalis), Marigold (Calendula officinalis), Marybuds (see marigold), mint, mustard, narcissus, nettle, oats, oxlip, pansy, parsley, pæony, Pig-nut (Conopodium denudatum), pink, plantain, poppy, primrose, pumpion, or pumpkin, rush, rye, Saffron (Colchicum or crocus), samphire, savory, Sedge (Carex pendula), Spear Grass (as this is probably Couch-grass, Triticum repens, you had better omit it), strawberry, Vetch (Vicia sativa), and violet.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

National Dahlia Society.—First show on September 8 and 9, at the Crystal Palace; second show on September 20 and 21, at the Royal Botanic Gardens, Regent's Park.

Perpetual Flowering Carnation Society.—This society's eighth and ninth shows will be held at the Royal Horticultural Hall, respectively on May 19 and December 13.

Finchley Horticultural Society.—Fifty-first exhibition, July 14, at Manor House. There are 127 classes, and in 71 of these the prizes are specially provided.

Uxbridge Horticultural Society.—Wednesday, July 13, at Hillingdon Court. Roses and sweet peas are specially provided for.

MARKETS.

COVENT GARDEN.

Flowers.

Daffodils are plentiful and so are carnations and roses, but all sell readily at moderate rates.

CATALOGUES RECEIVED.

BEES, LIM., MILL STREET, LIVERPOOL.—A small spring catalogue of dahlias, carnations, bedding plants, pot roses, etc.

R. E. WEST, FIRTH DENE, REIGATE.—A hardy illustrated catalogue of rose protectors, trainers for roses, pergolas, rose cups and tubes, flower holders, labels, etc.

BOULTON AND PAUL, LIM., NORWICH.—It is only when one inspects a catalogue like the present that the infinite variety and usefulness of trellis work and mural treillage becomes apparent. Arches, arbors, verandahs, and pergolas in trellis work are illustrated, and there are numerous designs for garden seats.

J. CHEAL AND SONS, CRAWLEY AND VICTORIA STREET, WESTMINSTER.—A little booklet containing suggestions for ideal gardens, and illustrations of rock garden and old English gardens, garden furniture, etc., designed and executed by the firm.

WM. ARTINDALE & SON.

A NEW CHOICE AND RARE HARDY PLANT.

SILENE.

*— **laciniata Purpusi**, one of the finest introductions of recent years. A rare species found by Mr. Purpus on the mountain ranges of Mexico, at an elevation of 11,000 feet, in a dry, sunny position. A charming rock plant, having narrow green leaves of graceful spreading habit, height about 6 to 8ins., flowers very freely throughout summer of a rich fiery cardinal red, flowers deeply laciniated; requires a dry position, having a liking for deep crevices between rock stones. Do not disturb them after once planting. During winter a little protection with small branches of spruce or shrub is beneficial.

6 to 8 in. 1/- each; 10/6 doz.

MONEY RETURNED IF NOT APPROVED.

OUR Renowned Catalogue of **Herbaceous and Alpine Plants**, not merely a price list, but a book of 200 pages, full of useful information, post free on application.

NOTES OF THE WEEK.

Cross Fertilisation.

In the study of natural phenomena nothing can appeal to one's sense of awe more than the subtlety which underlies them, and often produces far-reaching effects from apparently insignificant laws. The great majority of the members of the plant world are so constituted that by themselves, and independently of outside influence, they are capable of reproduction; most flowers are complete in themselves, possessing both stamens and stigmas, so that self-fertilisation would seem inevitable; but since it is a law in Nature that cross-fertilisation is preferable, and tends more to promote the stamina of the race, innumerable contrivances exist to frustrate the action of the pollen on the ovaries of the same flower, and to convey it abroad to form other alliances. The simplest arrangement to this end is that by which the stamens and stigma mature at different times, do not synchronise, so to speak, while the most effective is seen in those cases in which Nature has placed them far apart on separate plants. The most interesting, however, are those in which insect aid is involved in the transference of pollen from one flower to another, and it is undoubtedly due to this that we owe by far the major part of the diversity of structure and brilliancy of colour which we see in the plant world at the present day. We believe it is safe to say that no flower which is habitually self-fertilised equals in beauty those where cross-fertilisation is the rule; the sweet peas may appear to be an exception, but the natural flowers would never have developed their multiformity and varied colours which now grace our shows had the hybridist not stepped in and broken through the natural rule. Our pansies would have remained but insignificant flowers had all the blooms adhered to the self-fertilising process which is partially retained by some of the violets, as these, in addition to their larger flowers, produce inconspicuous ones which can only fertilise themselves. Without this need for cross-fertilisation, it is indeed open to question whether flowers would have been evolved at all, for if we consider the fundamental simplicity of the fertilising process, and study how it is effected in non-flowering plants, such as the ferns, it is clear that the world might still be covered more or less with abundant vegetation, just as it was in the Coal Age, independently altogether of that insect agency, which, by introducing selection based on cross-fertilisation, has led up step by step to the floral wealth we now enjoy. In the ferns we have what are practically flowers, but on a microscopic scale, and so arranged that no insect selection is necessary, and the logical result has followed, since, despite the immense variety of fern types, there is practically but one type of the microscopic flowers all through, from the smallest to the largest, the only difference being in the frondage and the ways in which the spores are borne upon it. The great scheme of evolution, however, could not be fulfilled on these lines, drier conditions, and varied environments necessitated a departure from the fern line of life, and in some subtle way members of that family and its allies became modified to suit the changed conditions. Flowers, inconspicuous it may be, but yet easily visible, made their appearance, and the great law of cross-fertilisation, which meant infusion of new blood, came into operation to strengthen the race, and by enlisting the services of the insect world, to ensure its development on higher and higher lines of beauty and complexity. Of beauty, since the brighter the colour, or the larger the flowers or bunch of flowers, the better the chance of producing offspring, and of complexity because the flowers, by some subtle response to insect tastes and habits, became modified in form to assist the visitors to collect the fertilising pollen, and to prevent them from depositing it on the stigmas immediately adjacent, instead of on those of flowers subsequently approached. That the benefit accruing from such transfer of pollen is not merely imaginary has been amply proved. Darwin demonstrated that long-styled primulas crossed with short-styled pollen, gave not only more seeds but larger ones, which means more robust progeny, and in another domain altogether, every breeder of sheep, cattle, dogs, horses, etc., knows full well that inbreeding is, in the long run, fatal to the constitution of the race involved, just as a nation which persisted in close intermarriage would be bound to deteriorate, while the strongest races are the mixed ones.

MR. J. LYNE.

Mr. John Lyne, head gardener to H. F. Tiarks, Esq., Foxbury, Chislehurst, is of fine physique, tall, and "bearded like the pard." He has had a large number of young men pass under his care in the earlier stages of their gardening career, and many of these now occupy important positions as head gardeners, and every one speaks very highly of him. My Lyne is a "working gardener" in the truest sense, for his restless and boundless energy impel him to take a very practical part in the many and various duties that he is responsible for at Foxbury. Mr. Lyne's early gardening history we do not know, indeed we have not asked him for it, but we do remember that twenty-five and more years ago he was head gardener at Belvedere, Wimbledon, the residence of the Schlusser family, and he there made for himself a great reputation as a fruit grower and a skilful plantsman—orchids, dendrobiums especially, being remarkably well managed. When the Belvedere estate was broken up Mr. Lyne went to Foxbury, and here he has still further enhanced his reputation. Hardy fruit is well grown, and the splendid fruit room which has been illustrated in these pages is a splendid testimony to Mr. Lyne's judgment. Chrysanthemums and orchids are great favourites with Mr. Lyne, and he has won hundreds of prizes with the former. Mr. Lyne is ever ready to impart his knowledge to members of the craft, and, consequently, is in great request among the horticultural societies of Kent and Surrey. He is a member of the Royal Horticultural Society's Fruit and Vegetable Committee, and as a member of the committee of the Royal Gardeners' Orphan Fund, and also as one of the local secretaries of the fund, he has rendered invaluable service to the sacred cause of charity. Mr. Lyne is an active member of the executive of the Chiselhurst Gardeners' Association, which for a long series of years has annually raised a considerable sum for charitable purposes, and set an example to kindred associations of much value.

Water Gardening will obtain special attention in our next issue, and the articles and illustrations relating thereto will form a feature not less remarkable for its interest than for its usefulness. The contents will include articles on "The Making of Lily Pools," "Water Lilies," "The Planting of Water Margins," and "Hardy Aquatics," other than nymphæas. The illustrations will include several views in beautiful water gardens.

The Death of Major Enthoven, Chief Officer of the Parks Department of the London County Council, will give rise to a feeling of regret among those who knew him as an able military officer, and once more quicken a widespread interest in the London parks and gardens that are under the control of the Council. Less than three months ago Major Enthoven was appointed to the position he occupied at the time of his death, and the vigorous protests that were made in relation thereto will be fresh in the minds of our readers. We felt it our duty to criticise the course taken by the Council, not because Major Enthoven was wanting in ability, but because he had not received such training in horticulture as would have placed him in possession of the knowledge that is essential to the successful management of public parks and gardens. The protests that were made on all sides were all the more vigorous because the Council had invited applications for the position of Chief Officer from those who were well acquainted with such branches of horticulture as are more or less closely associated with park management, and then appointed a candidate who had been trained for a profession of a wholly distinct character. We are not concerned with the claims of any prospective candidate for the vacant post, but in the interest of the Metropolis and its magnificent open spaces we earnestly hope the Council will avoid the mistake that was made in February last, and appoint to the important position of Chief Officer of the Parks Department a horticulturist who, by the work he has accomplished, has proved to demonstration that he is in every way qualified for the onerous duties associated therewith. There is no dearth of gardeners in this country who are fully equal to the responsibility of the position, and we trust the Council will recognise the fact that a knowledge of gardening is just as essential to the officer in charge of the parks and gardens as an acquaintance with architecture is to their chief architect, or with law to the head of their legal department, and make the appointment accordingly.

Extension of Wimbledon Common. The meeting held on the 27th ult. at the Mansion House, in support of the movement to extend Wimbledon Common was well attended. The Lord Mayor, who presided, expressed his sympathy with the movement, and Sir George Gibb, one of the members of the committee of the Extension Fund, gave an outline of the scheme. Their principal object, he said, was not the mere enlargement of the area of the common, but the preservation of the beauty of the magnificent open space which forms so important a feature of the western side of the Metropolis. Happily, Wimbledon Common had not been disfigured, as so many public spaces in and around large cities were apt to be, by the crowding of buildings round them. The price, he thought, was reasonable, and he asked those present to assist in raising the £60,000 necessary for the purchase of the land. Lord Eversley moved a resolution commending the movement to the prompt and liberal support of the wealth of London, private and corporate, and, this having been seconded by Mr. H. J. Mackinder, M.P., was carried.

London Branch of the B.G.A.—The annual meeting of the London branch of the British Gardeners' Association will take place at Carr's Restaurant, Strand, W.C., on Thursday, May 12, at 8 p.m. Mr. E. F. Hawes will preside. The election of officers and other important business will be dealt with, to be followed by a discussion on the policy of the B.G.A., which will be opened by Mr. Feltham, of Kew.

Pansies and Violas from Rothesay.—The large gathering of flowers of violas and fancy pansies, sent by Messrs. Dobbie and Co., from their nurseries at Rothesay, presents a highly attractive appearance on our table, and serves as a reminder of the remarkable development which these two classes of flowers have undergone within quite recent times. The flowers also indicate in no uncertain manner how greatly the attractions of the flower garden may be enhanced during the spring season by a selection of the finest varieties when placed under the conditions favourable to a vigorous growth. Prominent among the beautiful varieties now before us are the following fancy pansies: Nurse Engleson, lower petals mauve with white margin, top petals shaded blue; Mrs. A. B. Douglas, rich claret, with dark blotch; William Hamilton, lower petals deep claret, top petals lighter; George Dunn, flaked and striped rose-purple on blush ground; Duke of Argyll, lower petals purple with primrose margin, top primrose with purple margin; Nellie Currer, lower petals crimson-purple, top lavender-blue with deep base; J. McNab, maroon with broad golden margin; Nellie Curzon, bottom petals purple-violet with yellow margin, top yellow with purple-blue margin; and Miss Neil, bottom petals royal purple with blush margin, top pale blush. Conspicuous among the violas are: Mosely Perfection, deep golden yellow; Mrs. H. Pearce, pure white; Mrs. H. Kinross, bottom petals deep blue, top light blue; Rose Noble, deep gold; Mrs. J. Lindsay, white shaded blue at margin; and Dr. McFarlane, bottom petals royal blue, top light blue, each petal marked with a wedge-shaped blotch of lavender-blue.

In Search of Knowledge.—On May 6 Mr. Leonard Sutton, Mr. Mansfield, Mr. W. M. Childs, Mr. R. Hart-Synnot, and Dr. Keeble start for Canada and the United States for a tour of inspection of the Agricultural and Horticultural State Colleges of those countries. These gentlemen are acting as delegates from the Council of the University College, Reading, and it is hoped that as a result of their tour great advances in methods of teaching and research will be made in this country. We understand that the expenses of the trip are being met by Mr. Leonard Sutton and Mr. Alfred Palmer, both of whom have devoted much time and money to advance the work of University College, Reading.

Falmouth Spring Show.—After a lapse of over thirty years the Falmouth Spring Show has been revived, and on April 21 a splendid display, held at Gyllyngdune, was opened by H.R.H. Princess Christian, in the presence of a large and influential gathering. The success of the undertaking was due largely to the energy of Mr. C. H. Hext, of Trebah, the president, and Mr. R. E. Gill, of Falmouth, the hon. secretary. Azaleas and rhododendrons were magnificent, as also were magnolias and other flowering trees and shrubs, while daffodils formed a large and attractive feature. Mr. J. D. Enys, of Enys, contributed the noble and beautiful Myosotidium nobile, and Mr. Howard Fox, of Rosehill, sent citron fruits, a giant bamboo, 21½ft. high, and a banana in fruit. We understand the show was a financial as well as a horticultural success.

National Rose Society's Literature.—We have to acknowledge the receipt of the "Rose Annual" for the current year, and the second edition of the "Enemies of the Rose," which the National Rose Society is now sending to its members. The "Rose Annual" is increased in size and improved in appearance, as compared with previous issues, and contains an immense amount of information on roses and their cultivation of a substantial character. The notes by Mr. H. R. Darlington on the twenty-four roses recommended in the N.R.S. official catalogue for garden cultivation, are of much interest, and should prove of immense value to cultivators with but little experience of roses. Not less noteworthy in their way are the plans of rose gardens contributed by Mr. C. E. Shea, Dr. A. H. Williams, Miss Dorothy Page-Roberts, and Mr. R. C. Mount. The plans possess much merit, and form a feature of considerable value, which is much enhanced by the views of those who have furnished plans on the formation of rose gardens. A much appreciated feature is the "Rose Analysis" for 1909 by Mr. E. Mawley, V.M.H. The "Enemies of the Rose" has, in its second edition, been thoroughly revised, and the additions and emendations add considerably to its value.

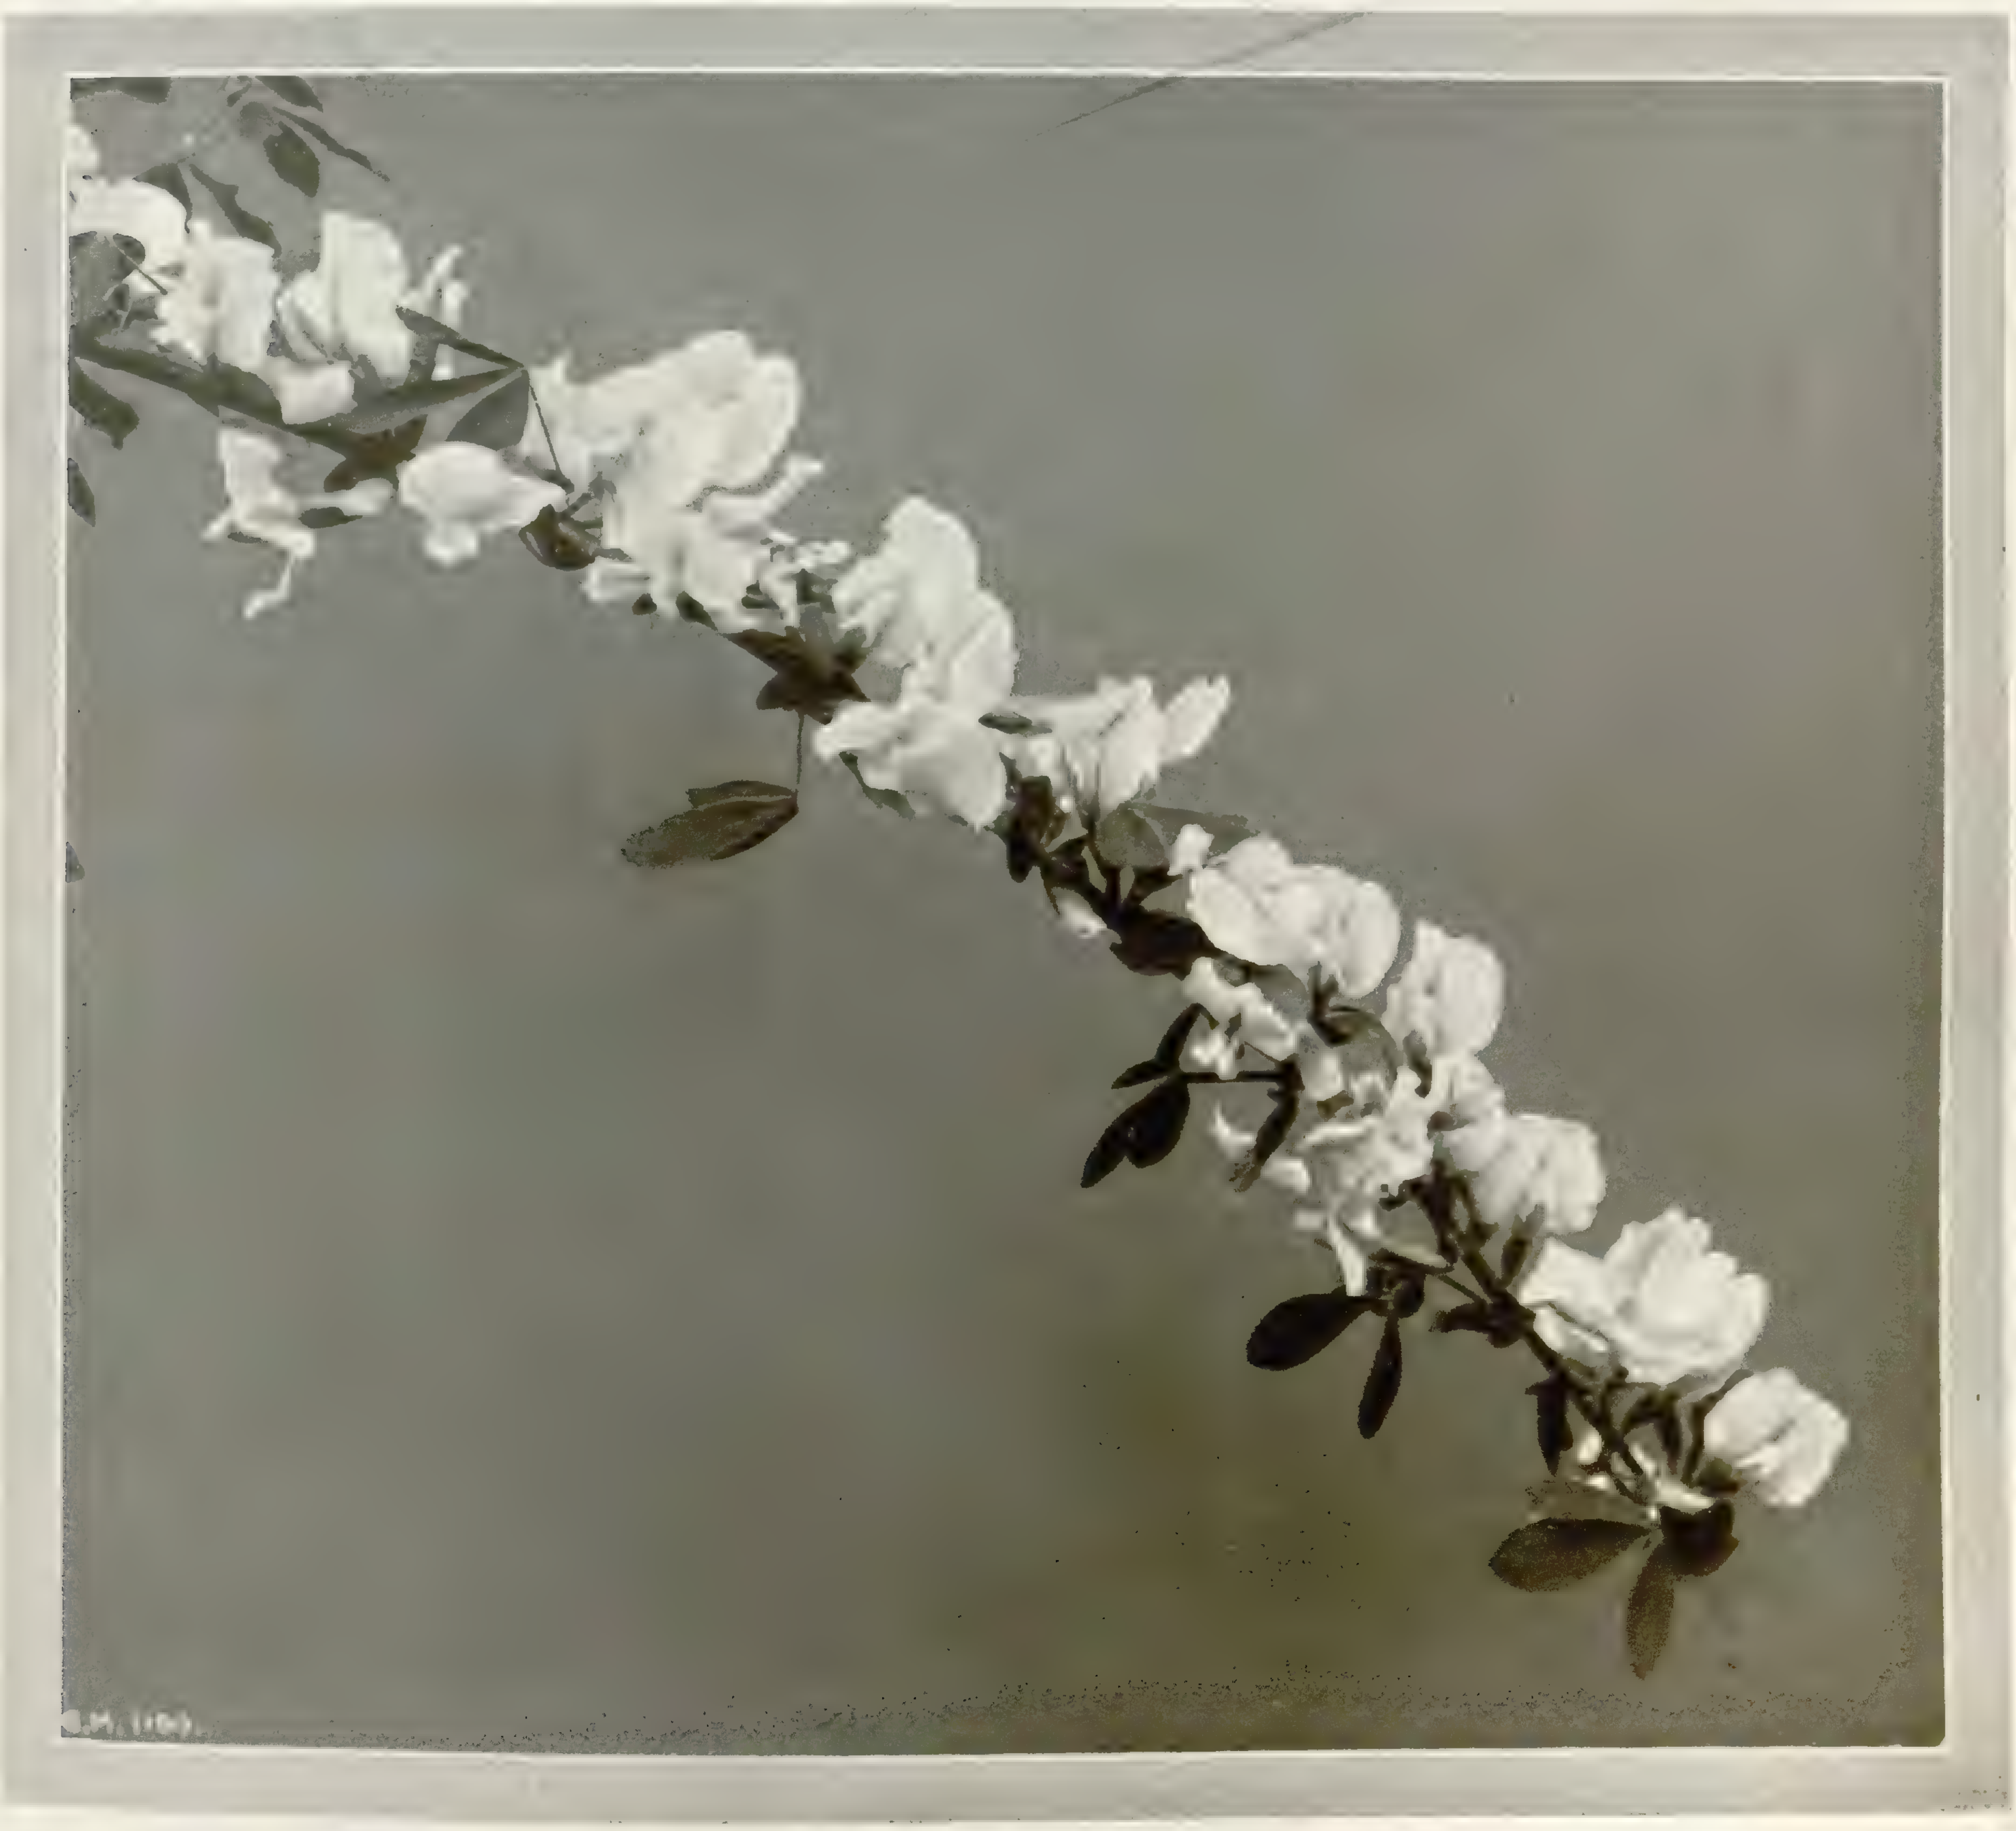
American Carnations formed the subject of an instructive lecture given by Mr. A. A. Fabius before the members of the Brighton and Sussex Horticultural Society the other evening. Mr. Fabius dealt at length with the details essential to success in the cultivation of perpetual-flowering carnations, and gave abundant evidence of his thorough acquaintance with them and their cultivation.

Japan-British Exhibition at Shepherd's Bush will be opened by H.R.H. the Prince of Wales on Thursday next, the time fixed for the opening ceremony being 11.30 a.m.

The Women's Congress on Gardening will be held at the Japan-British Exhibition on July 5, under the presidency of Viscountess Falmouth. An afternoon will, we are informed, be devoted to the congress, and the programme is of sufficient length to occupy at least two sittings. The subjects that will be discussed are, lady gardeners, lady gardeners for the Colonies, landscape gardening and expert advice, jobbing gardening, American landscape gardening, French gardening, market gardening, co-operation amongst ladies in gardening, and Nature study.

TRAILING CYTISUSES.

In common with the brooms that are more or less erect in growth, those of a decumbent or trailing habit thrive in soils that are light, sandy, and dry, and can be depended upon to succeed on banks and in other positions where the moisture is no more than sufficient to maintain in a healthy state plants that in a state of Nature have their homes on sandy wastes that are of but little value to the cultivator. Hence the species and their varieties that have a decumbent habit are of special value for planting on ledges in the higher parts of the rock garden, where the soil is usually comparatively dry owing to the difficulty in giving artificial waterings during periods of drought, and on sloping banks from which the rains pass away so rapidly as to seldom moisten the soil to any considerable depth during the season of growth. They should therefore receive a full share of attention in gardens where the rock garden forms a feature of importance, or dry mounds or banks have to be clothed with vegetation of a more or less attractive character.



CYTISUS HANDSWORTHENSIS.

A dwarf growing hybrid of much value for planting in the rockery and on sloping banks, and bearing cream-white rose-tinted flowers.

The most noteworthy of the species belonging to this section are:

Cytisus Ardoini, a charming species with spreading growths that rise four or five inches above the surface of the ground, and during April and May bear a profusion of bright yellow flowers. It is admirably adapted for planting in sunny positions in the rock garden, and is of interest as one of the parents of the fine hybrid known as C. Kewensis.

C. decumbens is a beautiful species, growing abundantly in some parts of the South European Alps. It has a free-spreading habit and blooms profusely, the flowers being rich yellow tinted with purple-brown, and produced during the latter part of the spring months.

C. hirsutus if not quite equal in all respects to either of the foregoing is sufficiently attractive to justify it being included in a selection for a large rock garden. The growth is neat and the flowers are bright yellow, and are produced in June.

C. purpureus is remarkable for its distinct colour, and for its attractiveness. The growth is elegant and spreads freely, and well-developed specimens, spreading over the face of the rockery are highly attractive when bearing a profusion of their bright purple flowers. This species is frequently seen grafted on tall stems of the common laburnum, and although large examples are not wanting in attractiveness when so grown, they possess a less pleasing appearance than do those spreading over the stones in the rock garden. The flowers are produced during June.

The trailing brooms of hybrid origin that are of exceptional merit include:

C. Beanii, a free-growing, handsome form, the result of a cross between C. Ardoini and C. biflorus, both of which have yellow flowers. This hybrid was raised some years since at Kew, and, like its parents, has yellow flowers.

C. Handsworthensis, a charming hybrid, with comparatively long and slender shoots, which during the season of flowering are clothed their whole length with medium-sized attractively-coloured flowers. The spray herewith illustrated was taken from one of the several pot plants exhibited by Messrs. Paul and Son, of Cheshunt, at the meeting of the Royal Horticultural Society, held on April 5.

C. Kewensis.—This charming hybrid originated as a chance seedling in the Royal Gardens, Kew, and is assumed to have been a hybrid between C. Ardoini and C. albus. It has a free-spreading habit and bears in great profusion its large cream-yellow flowers in May. One of the best of the trailing brooms for prominent positions in the rock garden. G.

TOMATOES IN THE OPEN AIR.

There is probably no other vegetable crop so much neglected as tomatoes cultivated in the open ground. With those under glass we find the reverse, and generally every detail of their cultivation is strictly adhered to. The neglect which accompanies outdoor culture may be largely accounted for by the fact that when grown in the open air tomatoes can never be regarded with the same amount of certainty as are other occupants of the kitchen garden. Therefore, many people set about their cultivation in a haphazard manner, placing their trust in the prospect of a good season, yet forgetting that even should such favourable conditions be secured, there is something more than sunshine and warmth essential to the development of fruitful plants. Too often, seedlings are put out to take their chance, and in the busy months of May and June they become sadly neglected.

Selection of Plants and Planting.

It is very important that a good batch of plants of a reliable open-air variety be raised and grown steadily until the time of planting out, and there is no better plan than to prick off the seedlings into boxes, and later put them into 48's, meanwhile keeping up a steady growth, just sufficient to produce short-jointed plants with a truss or two of flowers by the first week in May. By this time a start may be made at hardening them off in cool frames, and later in the open. It is the greatest mistake possible to plant out weak puny plants from boxes, or those that may have been drawn up under the influence of excessive heat; such plants receive a severe check, and take weeks to recover themselves, and this loss of time can be ill-afforded, as it very considerably minimises the season of growth.

Aspect and climate will determine, to a great extent, when it is advisable to place the plants in their permanent quarters. While tomatoes do exceedingly well in the open, they must not then be subjected to exposure as early as is possible on a warm border or against a wall having a south or south-west aspect. A very common mistake on heavy retentive soils is that of deep planting, whereby the young roots are brought into contact with a low soil temperature, which naturally arrests their growth. In order to give tomatoes a good start, and to encourage root action, they should be planted in a little ordinary potting compost, and if the weather continues mild, it will be found that they have become thoroughly established by the end of June. All plants should be securely staked after planting, as if allowed to grow in any other than a perpendicular direction, lateral growths become numerous, with the natural result that the terminal shoot soon ceases to grow.

After Cultivation.

When once established they begin to make rapid growth, and the advantage of their already possessing flowering trusses is that superfluous sap goes towards developing the fruit which would otherwise only tend to encourage leafy growth. The work of tying and pinching out lateral growths is very apt to be neglected during the months of June and July if not performed systematically. If success is to be attained fruiting must be restricted to the main stem, which, when clothed with a reasonable number of trusses of fruit and flowers, should have its terminal growth removed so that the plants can confine their energies to maturing and ripening fruit, and not in making unnecessary and useless leaf growth. I have rarely had occasion to deprive them of foliage, as there is no greater mistake than that of clipping back the leaves of the plant if large, well-developed fruits are desired. The thinning out of foliage which deprives the fruit of the full benefit of the warmth of the sun's rays is all that is allowable.

Manures.

It is always difficult to say what manure is best for any particular crop, and, like others, I have made the mistake of using farmyard manure too liberally. In fact, no manure containing nitrogen is ever an advisable dressing where the object is to produce quality in fruit, unless in addition to such nitrogenous food there is a proportionate allowance of phosphates and potash. In the early stages nitrogen produces a rank growth of stem and foliage, and to correct this one is often advised to keep the soil rather dry; but where phosphates and potash are used there is not this necessity of depriving the plants of moisture, even at the time of setting their fruit. During late years I have invariably mixed a little phosphatic guano in the soil at the time of planting out, and followed this later on with a top-dressing of loam, with which is mixed about 1oz. of vitriolised bones, and ½oz. of sulphate of potash per plant. The young roots soon make their way into this, and appear to receive much stimulus.

There is no better way of assisting outdoor tomatoes than that of top-dressing; by this practice new roots are encouraged, and these are much more beneficial to the plant than are those below ground,and particularly so in wet seasons. When artificial manures are not used, a little spent manure may be incorporated with the soil at the time of planting out, and when the fruit is set periodical waterings of diluted liquid manure may be given, but on no account heap up a heavy dressing of rank farmyard manure around the base of the plants.

Varieties.

The finest crop of outdoor tomatoes I have ever seen was grown in a private garden in the New Forest, the variety being the well-known Magnum Bonum. This is still one of the most prolific sorts, but, unfortunately, it is not a general favourite, merely on account of its corrugated surface, an objection which might very well be waived in view of its other qualities of size, colour, and flavour. Of the globular varieties there are numbers to select from, but Up-to-Date is difficult to beat, as it is a free setter, and produces plants of a dwarf, sturdy habit of growth. The fruit is also of excellent flavour and colour. Sutton's Open Air, Laxton's Open Air, and Dobbie's Champion are also worthy of mention. As with indoor varieties, it is most important that a good strain is obtained of whatever kind is selected, and most of our principal seedsmen make a speciality of at least one good open-air variety.

THE CUCKOO SPIT AND FROG HOPPER.

When reading the very interesting article by Mr. James Scott in your last issue, I was hoping to find the solution of a mystery which I have long sought, but in vain. As is only too well known, the larvæ of the fly appears in immense numbers in the late spring, enveloped in spittle-like masses of froth, formed at the expense of the sap in the plants attacked. Later on this disappears, and during the summer only the perfect insect, a hard-skinned, frog-like hopping fly is seen. Now, my difficulty is this. Mr. Scott explains that this fly, by means of a sawlike apparatus or ovipositor, is enabled to gash the tissues of plants and deposit its eggs therein, whence, he states, in a short time, the larvæ, or spittle-forming stage issues. I have never, however, seen the perfect fly in the spring, and have hence believed that, like most insects of this kind, the eggs are laid in the summer or autumn, nor have I ever seen the spittle stage late in the growing season; only the perfect hopping fly. How, then, does it happen that the larvæ appear the following season on entirely new growth, of which not even a rudiment existed the preceding season.

To make this clear I may state that in my garden I have several plants of the Oriental poppy, which dies down entirely in the winter, starts new growth in the spring, producing at the spittle fly season flower buds of large size, sheathed in a hairy leathery shell, and it happens year after year that when these buds are about the size of walnuts two or three tiny white patches of spittle appear on them, which contain the just-hatched larvæ of the cuckoo spit. How do the eggs get there? I have never seen the perfect insect at that time of year, and yet not only the poppy buds (which I have instanced as representing entirely new growth, which could not possibly bear eggs laid the previous season), but most of the plants in the garden are infected, which must mean the laying of a very large number of eggs not long previously, if, as Mr. Scott states, the hatching is not long deferred after the mature insect has inserted them in the cutting made by its saws, no trace of which, by the way, is visible on the poppy buds, as I have watched them time after time in my endeavour to elucidate the mystery.

That the larvæ, or spittle-forming stage, does not appear in my garden after the first attack, I am practically certain, for I always go round and destroy the pests when I find them depleting the plants of their life-blood. I may mention, as an additional fact, that there are nearly always two larvæ in a mass of foam. Perhaps Mr. Scott will add to his notes an explanation of this mystery.

Chas. T. Druery, V.M.H., F.L.S.

Ixoras.—In tropical India and Africa the ixoras form handsome flowering shrubs, and the large scarlet corymbs of flowers are used in the temples of some Hindoo deities. In Britain ixoras are unsurpassed in beauty by any of the stove shrubs grown for their flowers; under good cultivation they bloom freely and are very attractive, and their flowers are much appreciated for decorations. They require a temperature of from 70 deg. to 80 deg. during the summer, and from 60 deg. to 65 deg. in autumn and winter. Until they have attained a large size an annual shift will be necessary, and they should be potted in fibrous peat to which a liberal proportion of sand has been added, and have the new soil pressed firm. They are propagated by means of cuttings of the side shoots placed in a close frame, with bottom heat. The most desirable for general cultivation are Ixoras coccinea superba, scarlet; I. crocata rutilans, red; I. Duchess of Teck, orange-red; I. Fraseri, scarlet; I. macrothyrsa, bright red; I. Prince of Orange, orange; I. Westi, whitish; and I. Williamsi, scarlet.—P. P.

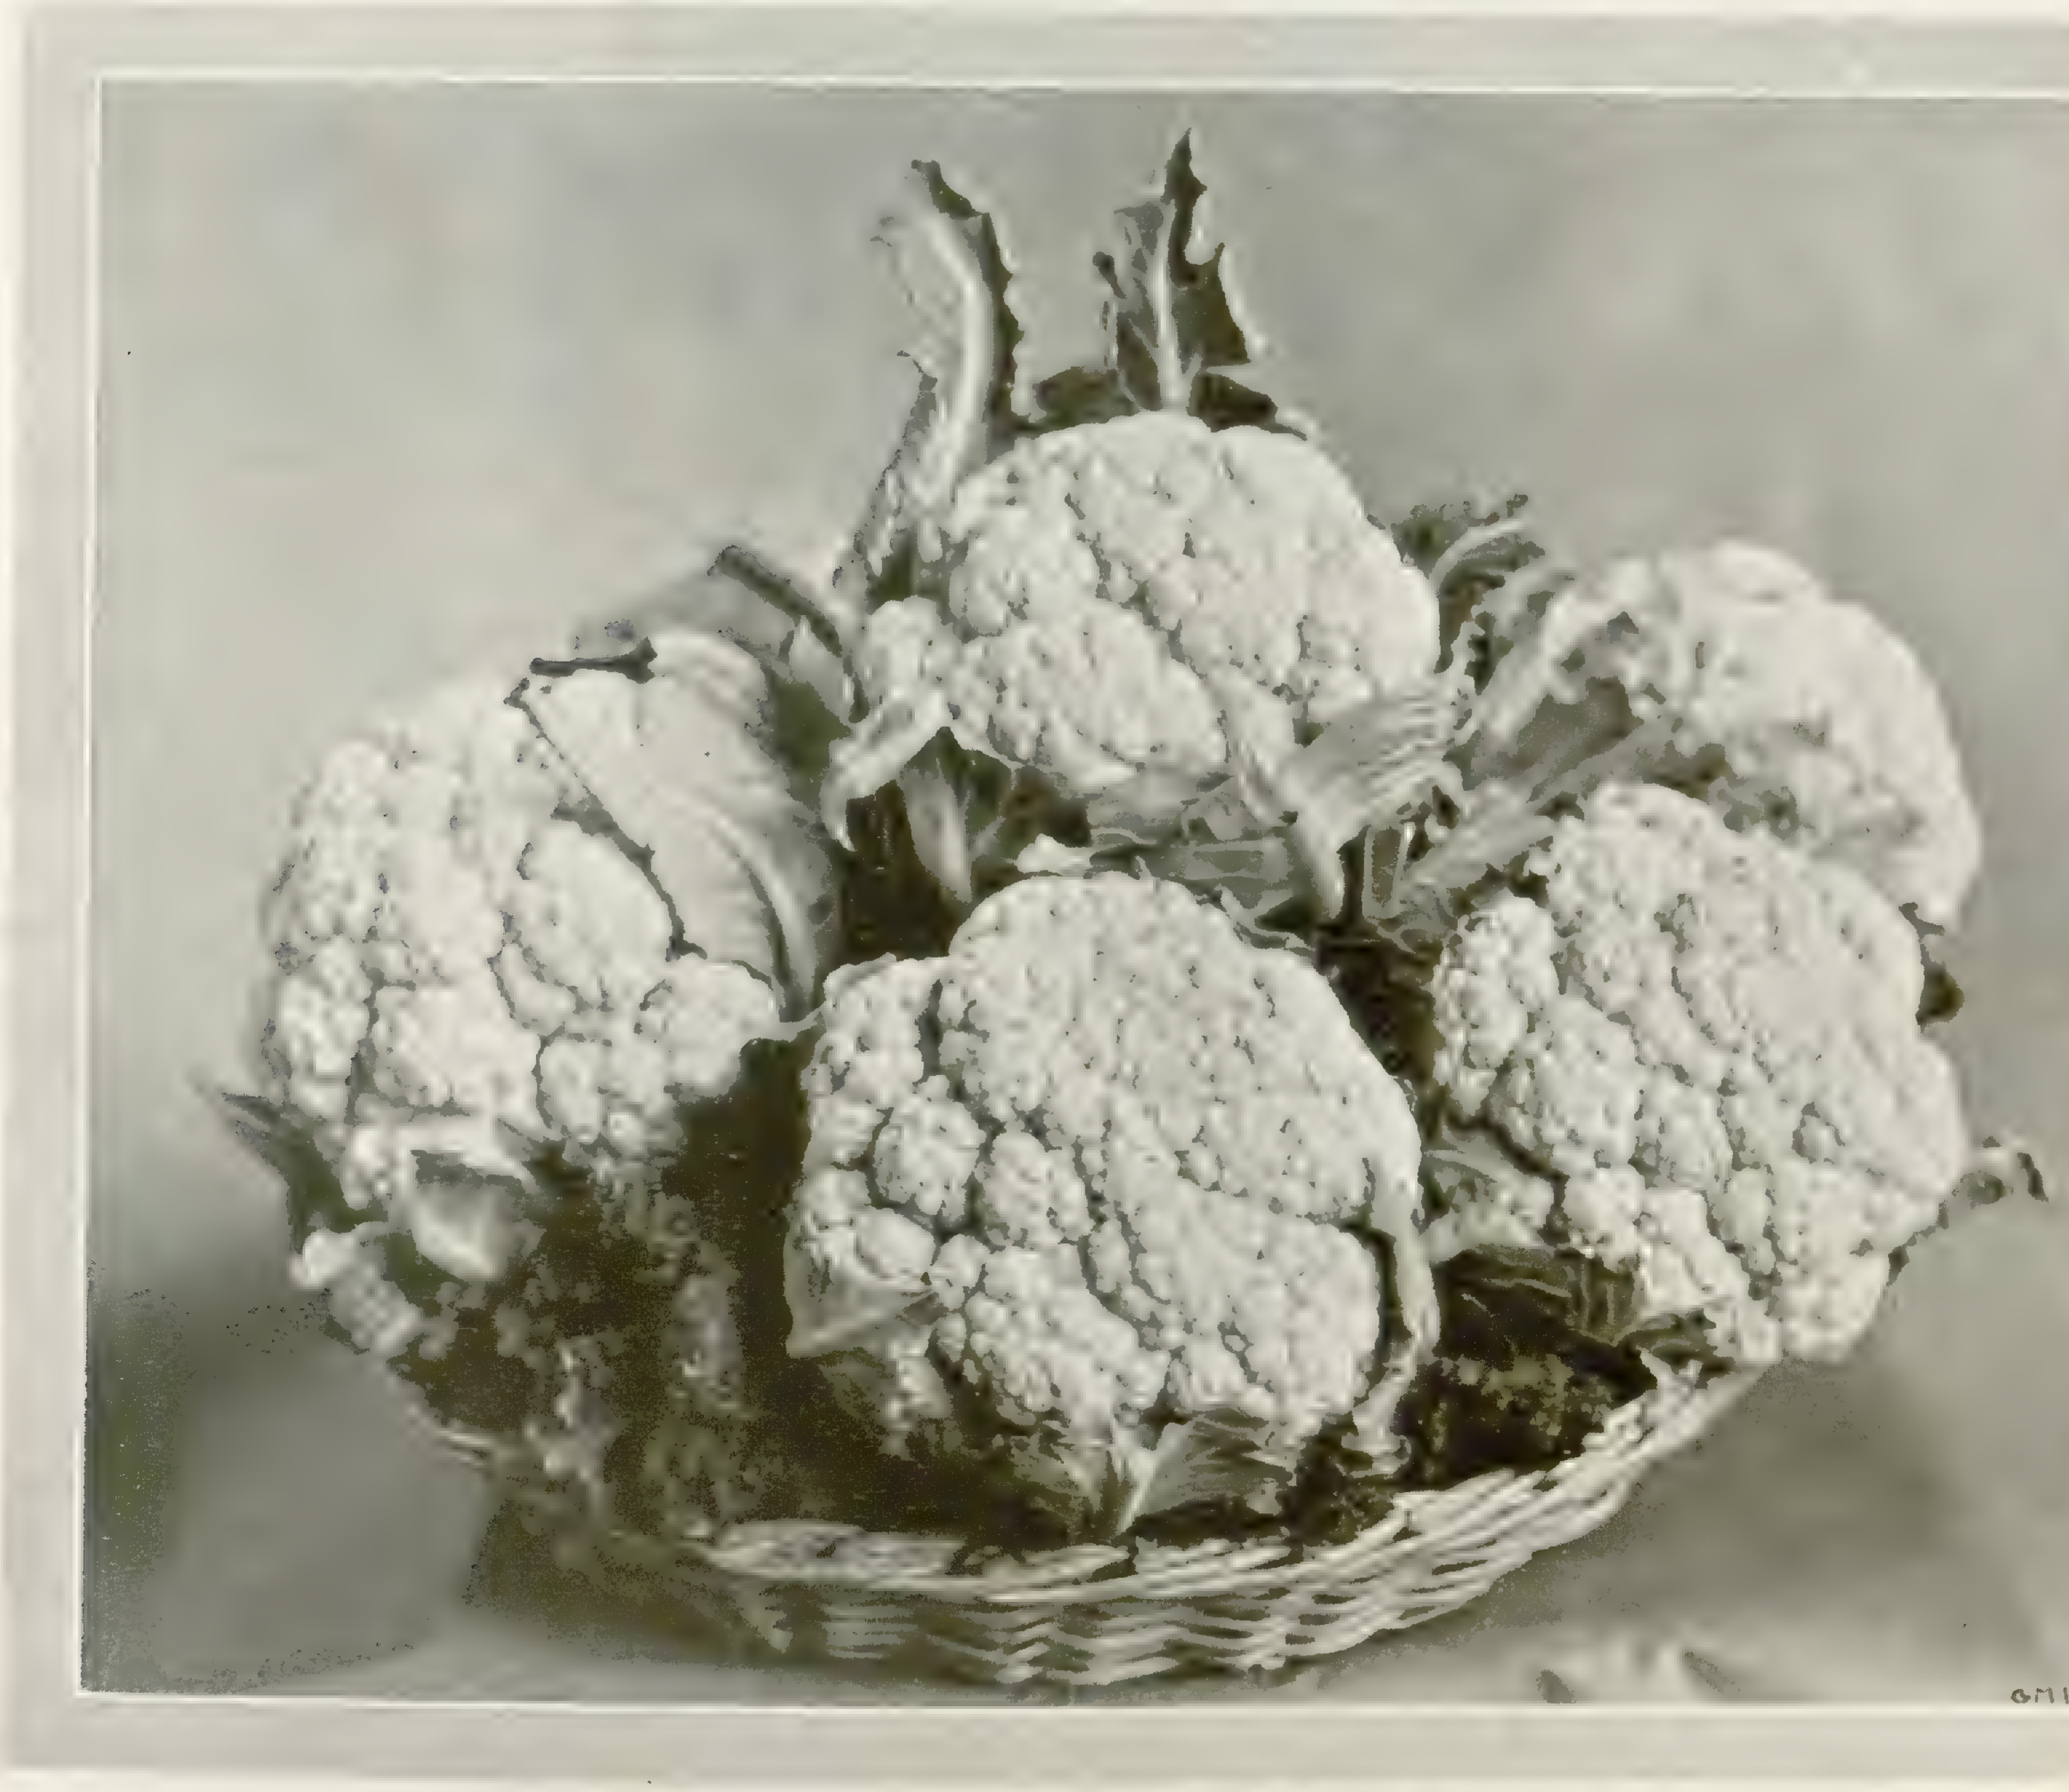
WINTER BROCCOLI.

To produce a good crop of broccoli, and also a successional supply, should be one of the chief aims of the kitchen gardener, as few vegetables are considered a greater delicacy than these, and their value is doubly enhanced, for in their season the choice of vegetables is very limited. The past winter has been an exceptionally favourable one for the perfection of broccoli, and quite a striking contrast to the one previous, when crops of all the brassica tribe suffered most severely, and in most parts of the country a great shortage was felt. Though the weather must always play a very important part in connection with this crop, yet at the same time a very great deal must also depend upon the right selection of varieties, and the cultural details.

During recent years many new varieties of sterling merit have been introduced, and I will presently name a few of those that I am much impressed with, for the quality of many of them is so marked that it is really a difficult matter to distinguish the broccolis from cauliflowers.

Seed sowing is best performed at intervals from the middle of April to the middle of May. Select a piece of ground, of poor quality for preference, and one that has not accommodated the brassica family for at least two years. Sow the seeds thinly and evenly after having made a good tilth, and net, or use some other device, as protection against birds. When large enough the seedlings should be transferred to their permanent quarters, and here let me emphasise one important factor in their cultivation, and one that does much to improve their hardiness. With the exception of very late plantings it is preferable to plant out on land that has carried some crop, and, consequently, been made firm, even if one has to make holes with a crowbar, which, by the way, is far the best means of planting. Make the plants very firm, and be sure that the roots reach the base of the hole; then well water in.

A distance of two feet six inches between the plants will be found quite sufficient, with a trifle less between the rows. Should the ground be uneven this can be easily remedied by a light forking. For ordinary purposes little else in the way of attention will be needed, with the exception of an occasional hoeing, and during dry weather, when growing freely, an occasional soaking of water will be beneficial, afterwards applying a mulch of some kind.



BROCCOLI SUTTON'S SUPERB EARLY WHITE.

A good plan is that of planting between the rows of peas, where space allows of this, and another method to adopt for late sowings is to plant in the warmest part of the garden, under a south wall, having first well dug and enriched the soil with a good dressing of farmyard manure. Under these conditions the plants will make a free growth, and often turn in at the right time, and so prevent a gap, while, being in a sheltered position, it is not necessary to encourage such a hardy growth as in the open.

During hard weather all means must be taken to protect the plants, and the best method I know is to open out a trench about fifteen inches in depth and have the plants turned over with a fork so that the heads face north. Then take out another trench and cover the stems of the previous layer well up to the crown with the soil so moved, and make the soil firm round the collar of the plant, as this is the most tender part. If the weather be very severe additional covering must be provided, such as straw or bracken, which should, however, be removed immediately the weather breaks.

Probably the broccoli most closely related to a cauliflower is Sutton's Michaelmas White. This is quite one of the very best for succeeding late crops of Autumn Giant cauliflowers. Sutton's Superb Early White and Sutton's Christmas White are both very desirable varieties of fine quality. The old Snow's Winter White is still hard to beat as a hardy mid-winter variety, and should always be included. Another very fine old variety for succeeding this is Leamington; when a true stock is obtained it is invaluable in any garden. For further succession Veitch's Model is excellent, and it has the advantage over many other varieties of being extremely hardy, and producing leaves that protect the curd from exposure till the very last. I know of no variety that is so self-protecting, and few can surpass it both for appearance and quality.

E. Beckett, V.M.H.

Aldenham House Gardens.

Half-hardy Annuals.—It may be useful at the present time to state that the best time to transplant stocks, asters, zinnias, Phlox Drummondi, or any other like subject, is as soon as they are large enough after the season is sufficiently advanced, for if allowed to become starved in boxes they do not start away freely, and if allowed to remain too long when pricked out on half-spent hotbeds they quickly grow to a large size and feel the effects of removal. Select a showery day, if possible, and transplant each with a small ball of soil.—A. B.

THE FELTHAM DAHLIAS.

For a number of years Messrs. T. S. Ware, Lim., Feltham, have devoted a great deal of attention to dahlias. They have exhibited these flowers extensively and well at the leading exhibitions, and devoted a very large portion of their Feltham Nursery to the trial of varieties. They have also raised a large number of seedlings, and, having a wonderful collection of the newer sorts from other sources, they have had exceptional opportunities for estimating the value of their own.

A HANDSOME DECORATIVE DAHLIA.
This is a rich maroon and rose-purple sport from Souv. de Gustave Douzon, and it originated with Messrs. T. S. Ware, Lim.

There is no reason whatever why dahlias should not continue to be popular as exhibition flowers, but the time has gone when dahlias, no matter what their section, may be considered solely from an exhibitor's point of view. The Messrs. Ware were quick to see that dahlias did not secure that measure of popularity their beauty and time of flowering appeared to justify, and so they set out to popularise the flower, and soon found that, if business was to develop materially, it must be along the lines of garden decoration. Last season the firm had a marvellous display of dahlias at Feltham, and from their large collection of cactus varieties they made a selection of those most suitable for garden decoration. The selection is as follows:

Alfred Vasey, crimson and amber; Amos Perry, flame red; Captain Broad, bright crimson; Countess of Lonsdale, salmon; Dainty, pale yellow and pink; Effective, amber pink and rose; Eva, white; Fighting Mac, bright crimson; Fire King, scarlet; Floradora, deep crimson; Fred Cobbold, bright crimson; General French, terra-cotta; Gladiator, apricot and salmon pink; Kriemhilda, cerise pink, white centre; Laverstock Beauty, vermilion; Liberté, rosy carmine and maroon; Mary Service, heliotrope; Mrs. Clinton, orange and salmon; Mrs. H. C. Brousson, salmon over yellow; Mrs. McKergow, amber; Mrs. Sanders, yellow; Red Cap, crimson scarlet; Spotless Queen, white; Sweet Nell, pink; and Vesuvius, yellow, striped crimson. We had an opportunity of inspecting these varieties when in flower, and can bear testimony to the excellence of the selection.

In addition to these tried varieties of several years' standing, the Messrs. Ware strongly recommended Flash, scarlet, rather small flowers; Miss Willmott, orange, very long stems; and Stalwart, vivid crimson-scarlet, all of which have gained three marks at Wisley for usefulness for garden decoration in the trials conducted by the Royal Horticultural Society. Then there is an entirely new set of four varieties, selected from many seedlings, and with garden decoration in view. This set consists of Dibs, rose-pink and gold; Her Ladyship, rosy lilac; M. Inman, bright orange-scarlet; and Veritas, salmon-pink marked with chocolate-red. In each of these four varieties the flowers are borne on long, stiff stems, and thus carried well above the foliage; the average height is about four feet, M. Inman being the tallest and Veritas the shortest of the set. M. Inman and Dibs appealed to us as being very great advances in the direction of garden cactus dahlias, and it must be remembered that the flowers, as well as the habit and colour, are good.

We have consistently urged in these columns that the great majority of show and fancy dahlias are extremely valuable for garden decoration, provided they are not grown in excessively rich soil. This view was once more emphasised on the occasion of our visit to Feltham last autumn, for the breadths of show dahlias presented a mass of colour. Most of the pompon dahlias also come under the description of garden dahlias, but these, and the show varieties, may be selected from any good catalogue, according to the colour or colours required.

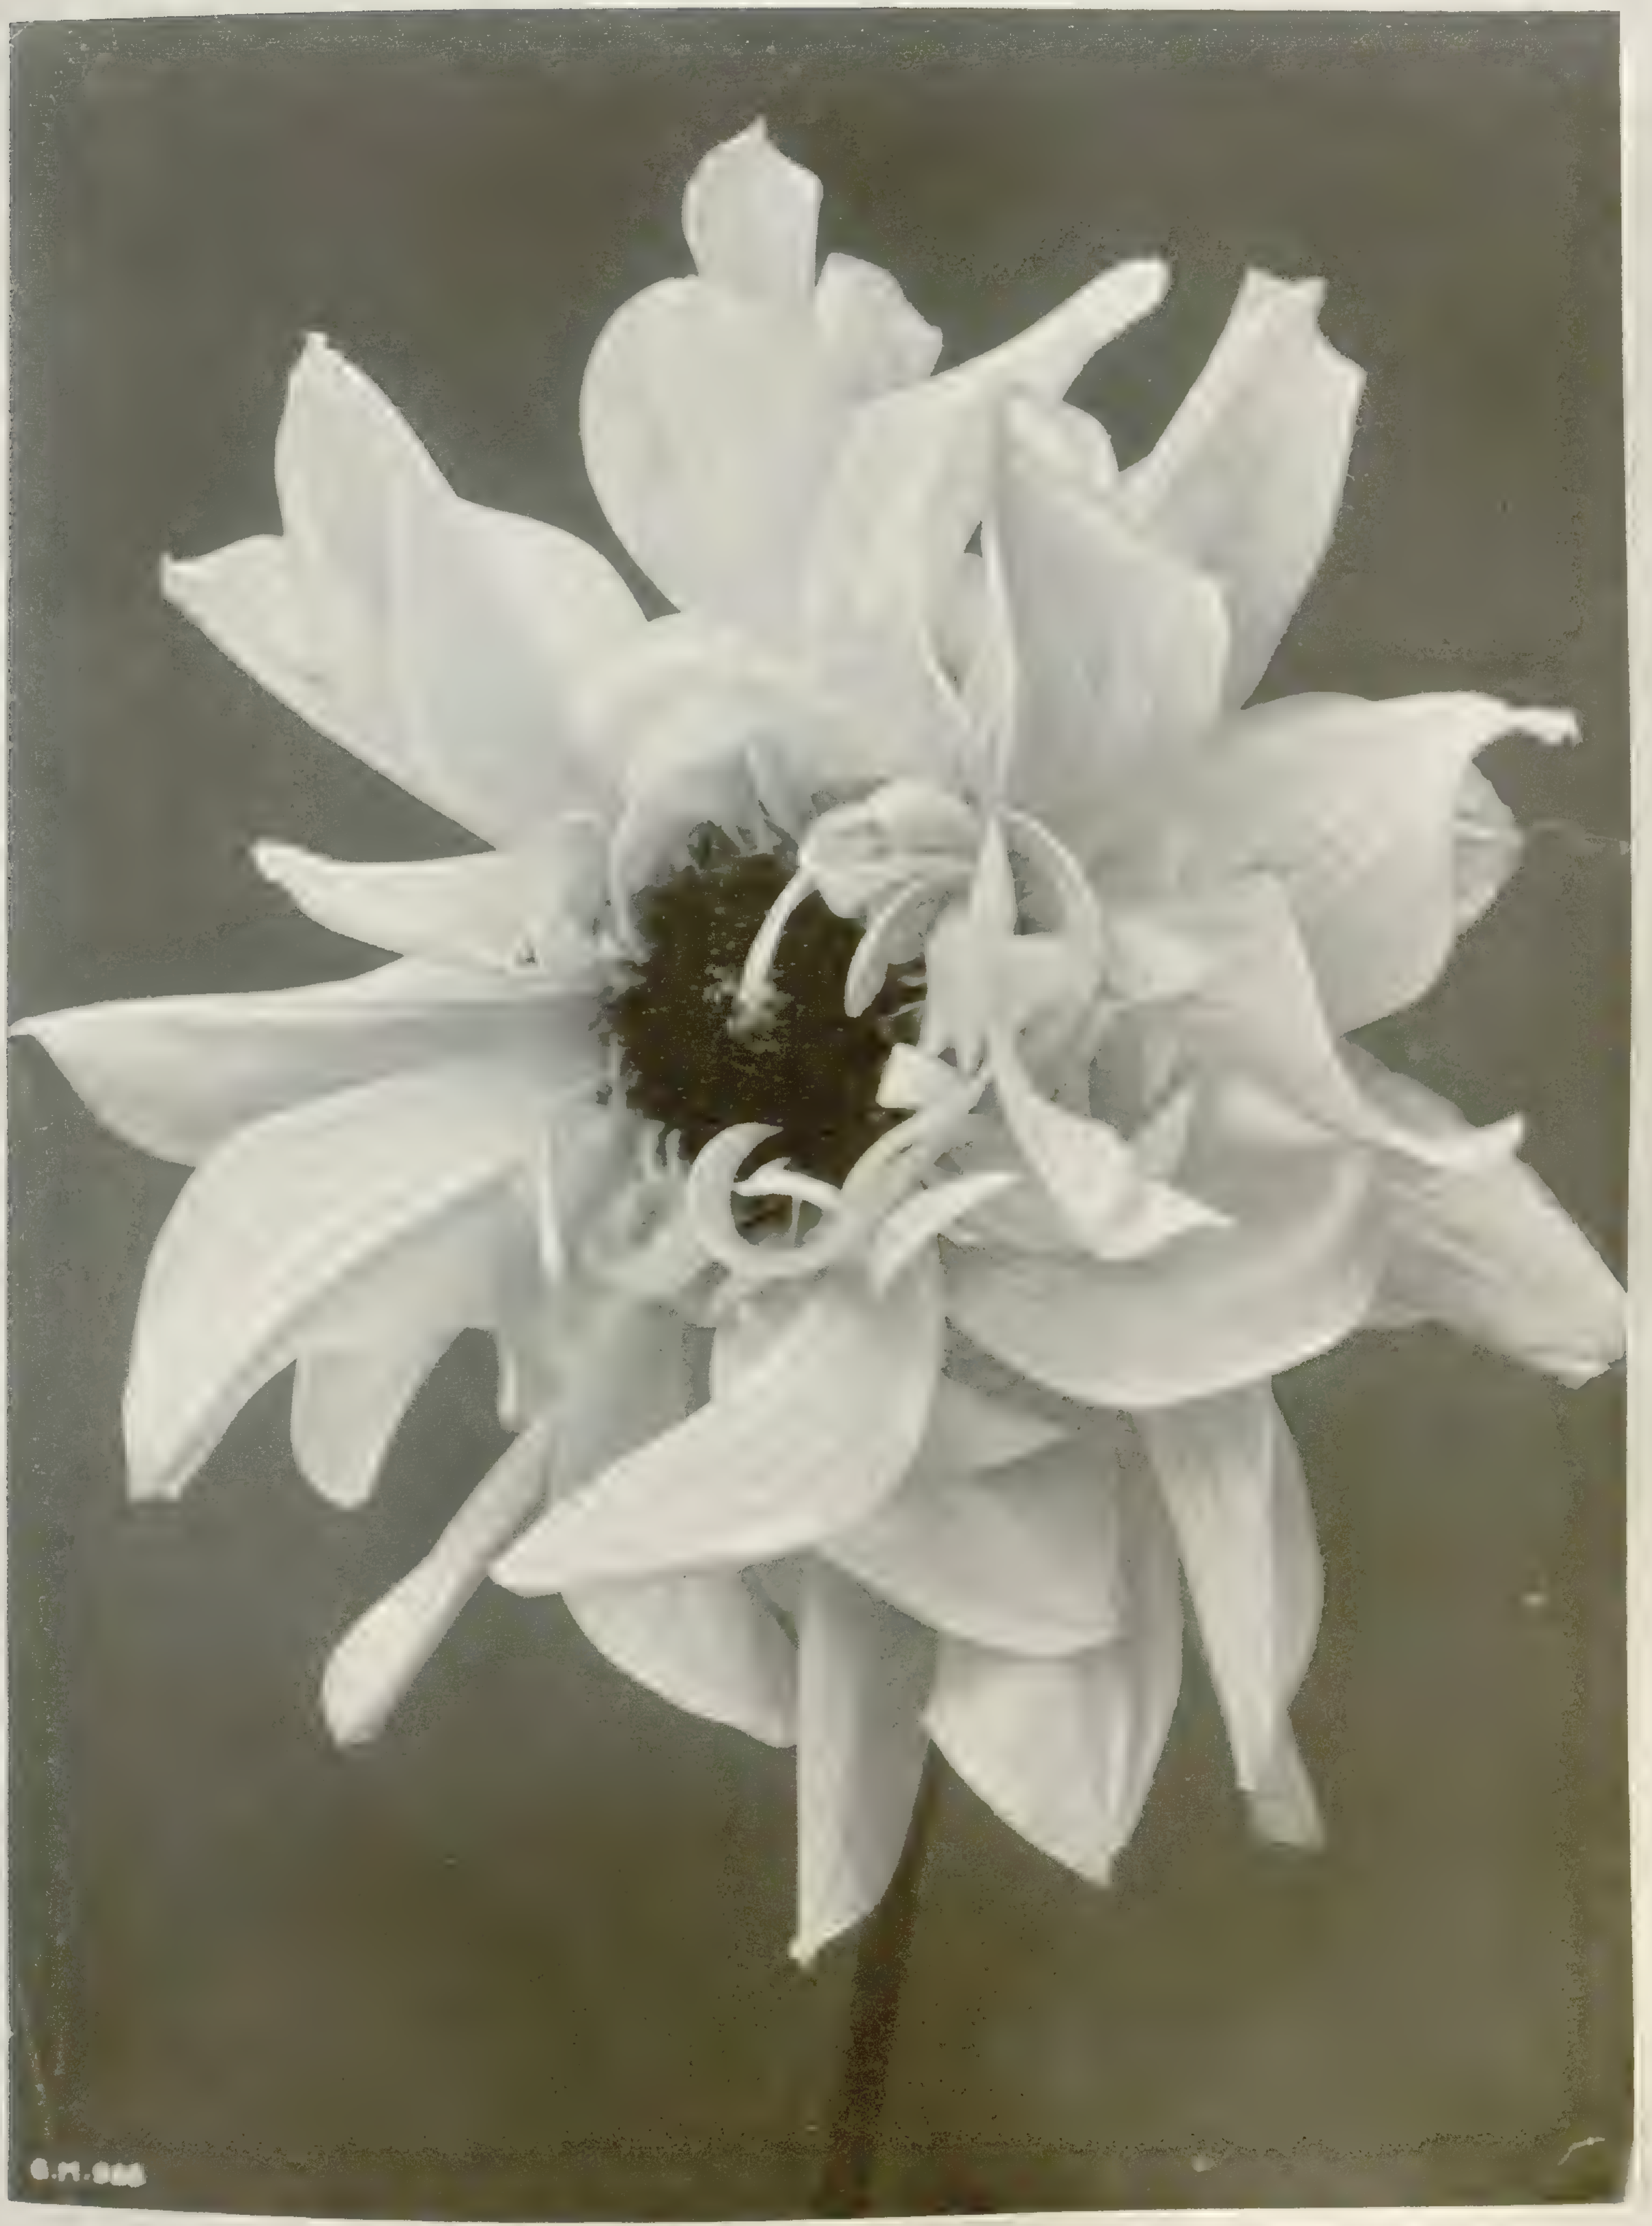
Decorative dahlias, as distinguished from cactus varieties, include several varieties of great value for the decoration of our gardens in late summer and autumn, but the class contains also a number of varieties of little value. The best, as judged at Feltham, are Black Prince, maroon; Constance, white; Grand Duc Alexis, a huge white flower flushed with pink; Harry Freeman, white; Le Colosse, red; Maid of Kent, crimson and white; Market Yellow, yellow; Mdlle. H. Charvet, a big white flower; Mrs. Kingsley Foster, golden amber; Perle de la Tete d'Or, white; Salisbury White, white; Souv. de Gustave Douzon, huge orange-red flowers; a new sport from the latter, vivid and deep red, shaded yellow and tipped with white (see illustration); and Yellow Colosse, deep yellow. For openings in shrubberies or for beds, belts, and borders in the pleasure grounds or in public parks and gardens, all these varieties are eminently suitable. Messrs. Ware have a fine sport from Souv. de Gustave Douzon, which is herewith illustrated. The colour is rich maroon, tipped with bright rose-purple.

One other class of dahlias that the Feltham firm has taken up with great energy and success is that known as Pæony-flowered. The earlies, Dutch varieties, are largely grown, but many of these are now surpassed by home-raised ones, and the Messrs. Ware's Admiration, buff, carmine, and yellow; Bronze Gem, rich bronzy red; Firefly, white, edged with crimson; Corallina, coral rose; Rev. H. J. Kitchin, pink and yellow; and Sunrise, pink, carmine, and yellow, have already proved their value for garden decoration.

But to the foregoing list must be now added the new set which the firm is offering for the first time this spring. Some folks do not like pæony-flowered dahlias, and we shared their dislike until during a recent wet and dismal autumn we found that the only flowers worth looking at were the pæony-flowered dahlias, which bloomed regardless of the unkind climatic conditions.

This new set includes several that are already known to those who regularly visit flower shows, because the Messrs. Ware exhibited them largely last season. Taking them in alphabetical order they are: Albatross, pearly-white, broad-petalled, and long-stemmed; Colonel Cody, bright buff and pink, very handsome; Hampton Court, pink, with great yellow disc; Klondyke, old gold and pink; Mrs. Alfred Platt, very large, many-petalled, bluish rose, very distinct, and with long stiff stems; Mrs. George Gordon, beautiful creamy-white, with very broad outer petals and smaller twisted petals round the yellow centre; Mrs. J. B. Riding, brilliant red, and very free; Ruddigore, a very attractive and gorgeously-coloured variety, purplish pink ground, heavily splashed and striped with orange and golden-yellow — a Japanese mixture of rich colours; and Yellow Gem, large, bright yellow, with orange centre.

Of course, all the best exhibition cactus dahlias are grown at Feltham, but we have not space to deal with them here.



PÆONY-FLOWERED DAHLIA MRS. GEORGE GORDON.

Pure creamy white, with yellow centre; raised by Messrs. T. S. Ware, Lim., Feltham.

REV. F. PAGE-ROBERTS ON ROSES.

(Concluded from page 343.)

◆

Pruning and Disbudding Roses.

Before attempting to prune roses, the grower should settle in his own mind whether his ambition is to have merely a profusion of bloom or flowers of beautiful form and size. The latter are, of course, the aim of the exhibitor; and for these, the pruning is a little more severe than that recommended in the case of the varieties that are generally known as decorative roses. One essential point in the pruning of roses of whatever class or variety is to keep the centre of the tree open, and so avoid overcrowding. And in all cases the cuts should be made to a bud pointing outwards. Fine shoots should be shortened back so as to leave four or five eyes. Except in the case of some especially vigorous growers, as for example Ulrich Brunner and Mrs. John Laing, not more than four or five shoots should be allowed to develop; and even on these particular varieties, five is generally considered the maximum number. The hybrid tea roses will not require such severe pruning, and often during the winter months such shoots as are best dispensed with are removed by frost; all that then remains is to cut out the dead wood and perform a judicious thinning of the shoots in the centre of the tree. Summer pruning, which in reality is only a sort of corollary to disbudding, is exceedingly beneficial for roses, and is indeed the only means of securing ideal blooms.

A good practice is to remove the old wood on which the first lot of bloom is borne, leaving the young wood to develop and ripen before the winter arrives. With regard to the climbing roses, such as Crimson Rambler or Carmine Pillar, or even the Wichuraianas, a somewhat elaborate method of pruning is advocated. Immediately the first blooming season is over the supports should be removed and the long stems laid on the ground. The whole of the wood that has bloomed should then be cut out from the base, in order to prevent the tree from developing into a mass of tangled useless wood; and subsequently the new wood should grow 10 or 12 feet right from the base of the tree. In any case, climbing roses are best pruned directly after blooming, for most of these roses flower on the shoots which come from the previous year's wood. Spring pruning is of no use for such trees. These remarks apply with equal force to the Banksian roses and the noisettes, which develop their bloom from the secondary wood. That beautiful rose, the Marechal Niel, is a most difficult variety to manage properly. The best method of treating it is according to the directions given by the Rev. Foster-Melliar in his "Book of the Rose"—that is, to cut it right back to the main stem, not leaving a leaf, making it look exactly like a vine in winter. By the autumn it will be covered with fine growths, which yield an enormous number of blooms.

Exhibiting Roses.

The choice of a rose for exhibition purposes, or, for that matter, even for ordinary decorative purposes, is always a somewhat difficult matter. The improvements which are annually effected in the different classes of roses are very considerable; and what may have been considered one of the choicest and best varieties a few years ago is now relegated to a secondary position. For example, thirty years ago such roses as Catherine Mermet and numerous other beautiful varieties were grown to perfection in the garden. Now, however, they have practically disappeared from amongst the popular varieties of garden roses; and have instead become greenhouse roses.

The advice given in the first part of these notes respecting the choice of varieties is of such supreme importance to rose growers that it may bear repetition. It is that only those varieties most suited to the local conditions of soil and climate are worth growing. It is waste of time and money and labour to attempt to grow other kinds. Furthermore, only the best and choicest plants should be retained in the garden; those that are not fine in every respect should be culled out. When preparing roses for exhibition they should be cut the day before, and, if possible, the operation should be performed before seven o'clock, for it is curious how roses start into growth after sundown. The stems should be fairly long and the roses carefully placed into tepid water. During wet weather it is important to protect the blooms from rain by the little white cones provided for this purpose by most nurserymen. When the rose is half grown it should be tied round with some wool in order to keep the petals together; and only a little judicious dressing is permissible. By lightly blowing on the bloom the petals may be loosened, and a camel's-hair brush may be used to press down to the base of the petals. R.

THE JAPANESE INVASION.

Already we are expecting much from the displays of Japanese horticulture to be made at the Japan-British Exhibition that will shortly open at Shepherd's Bush. Rightly or wrongly, as various impressionists will have it, the horticultural exhibits from Japan, and by Japanese gardeners, will leave a deep imprint upon the minds of English garden lovers and workers. Lessons will be taught and learned, and ideas promulgated, that the average gardener has hardly ever concerned himself about in the past, and the work of the artist in garden effects will receive such a fillip as will do much to advance our studies and ideals in this direction.

It is hard to predict what phase of the exhibits will attract the keenest attention, but one thing is certain, that we shall be astonished at the amount of detailed work and diverse scenic effects which can be put into a small area of garden ground.

We shall also be greatly struck by the laudable "copying of Nature," which will be typified in these and many other Japanese gardens. The Japanese garden maker is a keen scrutineer of natural scenery, so much so that he can copy realistically almost any given portion of his native landscape. It is no uncommon thing for a small Japanese garden to include hill and dale, stream and wild swamp, bamboo jungle, and mountain track, with the grand finale of mighty Fugi-Yama itself seemingly far away in the distance.

There is nothing that our Japanese artists will fail to reproduce. Even the glorious pine-clad islets of Matsushima, the beauties of the Iris valley at Hori-kiri, the wistaria wealth of Kameido, and the wondrous pictures around Nikko, are drawn upon as subjects for minor gardens, and, this being so, can one wonder that the Japanese garden is a successful garden?

This way lies the garden secret, the true and perennial cause of an attractive garden. We must have a garden of ideas, something really out of the common, and that will impel attention at all times and enthuse when the seasons are in full swing. It is the individualistic in gardening which makes for garden charm. It is not the ornate combination of flower schemes, but the simplicity of a direct appeal to the eye and mind of certain subjects at certain seasons, chosen to harmonise with the landscape, that really tells. For instance, let us consider the attraction possessed by a simple fern-clad dell in summer, the gold of the gorse in spring on the uplands, or the moors "purpled o'er" in late summer and early autumn with its heather. It is the simple and natural idea that tells: in it is art, and the sooner garden lovers realise this, the better will it be for the English gardens. It is in such effects that the Japanese garden maker excels. He realises the impressiveness of old gnarled tree trunks and storm-bent boughs. He knows the effect of natural harmonies of stone outcrops and boulders in a broken landscape, and the lighting and softening effects of pool and stream. He will bring spring into her fullest glory by his wealth of flowering plums, peaches, and cherries. He knows the value of iris tones for summer days, and will welcome autumn with a riot of colouring, culminating in the glowing crimson of the maple leaves. Whose hand but an artist's would plant scarlet azaleas against a grey hillside, or twine the wistaria in a trellis overhanging the shimmering water, or plant informal stepping-stones through pool and swamp?

We shall be shown how to utilise stone to the fullest advantage. Quaint old stone steps, fantastic designs in stone lanterns, and similar serviceable subjects will greet the eye from various positions. Natural rocks, chosen with studious care, are arranged as they would be upon a natural hillside, will give the onlooker the impression of being part and parcel of the garden itself.

Then, the woodwork of the Japanese garden is equally tasteful in design. The quaint tea house, among the wistarias or the Iris swamps, is just a light, artistic and withal natural arrangement. There is nothing ponderous, incongruous, or "raw" about its appearance. Clothed with vines or wistarias, these are examples of studied grace, while the bold trellises, and the charming round bridges, are equally suggestive of the artist's eye and hand.

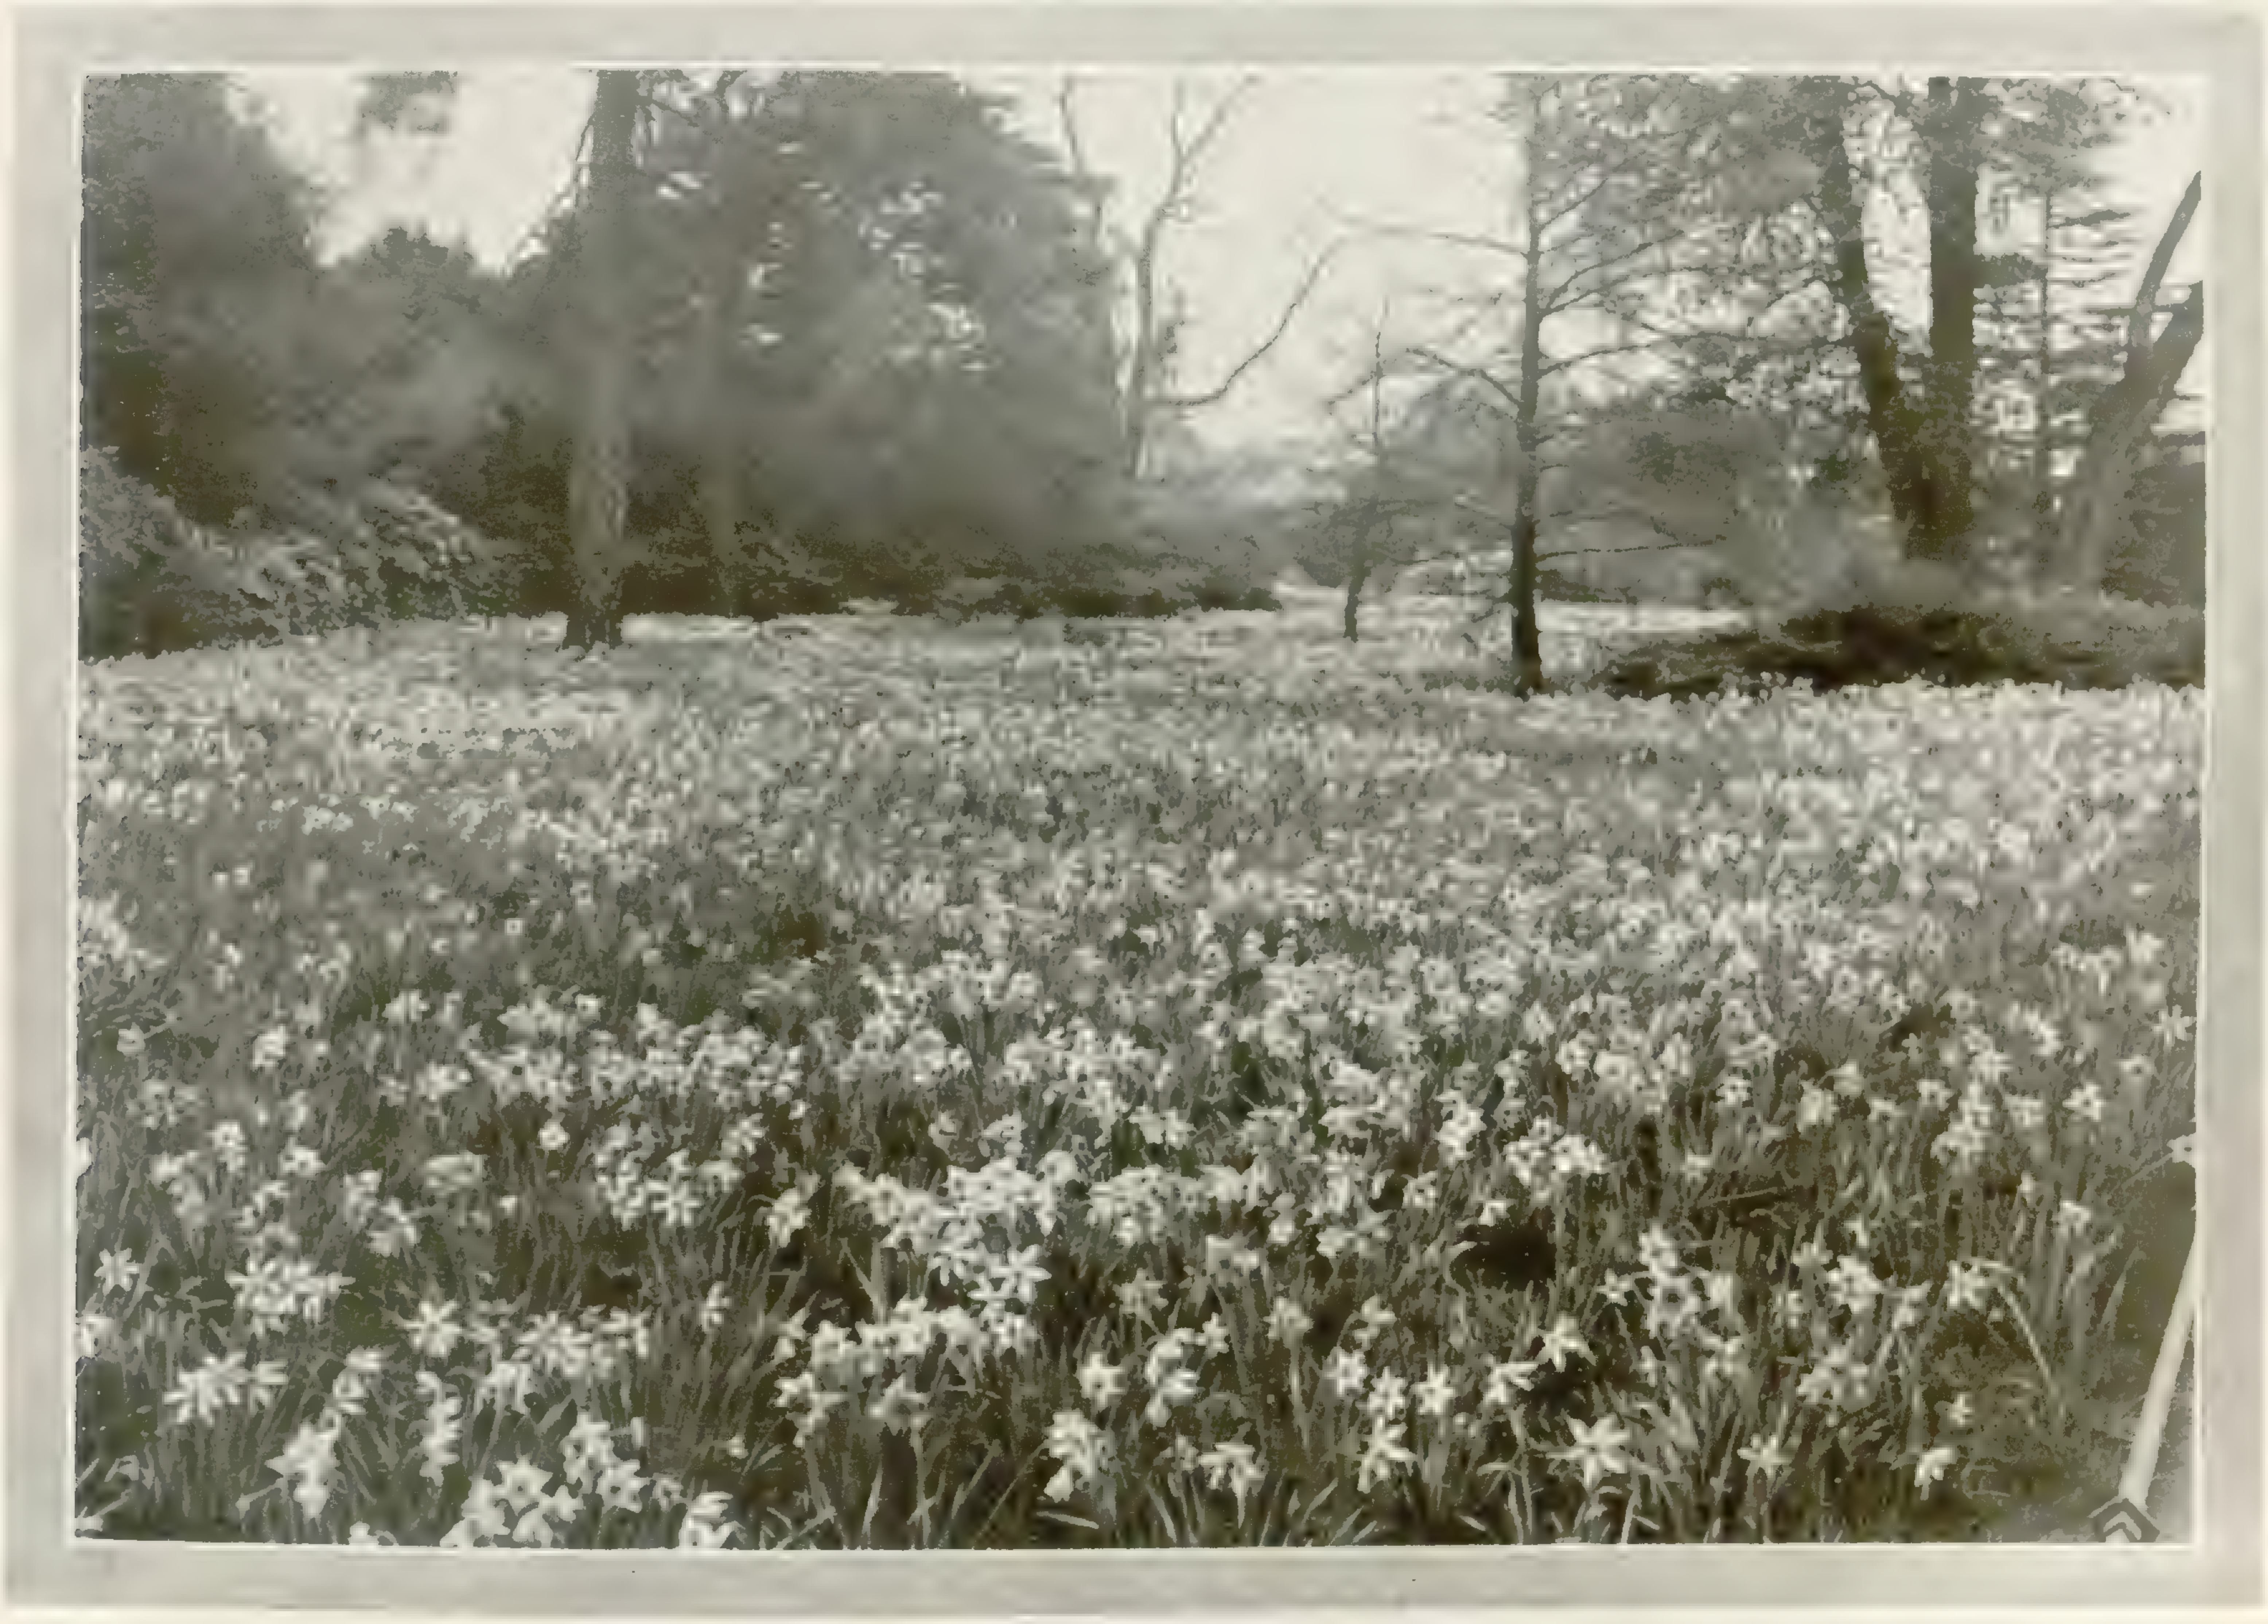
Certainly there is no question but that these ideas from Japan are going to influence us immensely. We shall see a widespread repetition of lily pond and iris swamp, of azalea brilliancy, and bamboo thicket. All the principal subjects used by the Japanese gardener will be laid under contribution. The early beauties of the "ume" (plums), the glory of the cherry and peach, the rich hues of the maples, the wealth of the pæony, and hardy lilies, the darkness of pines and junipers, will be utilised, and soon these will be better represented in the majority of our English gardens.

The writer has no desire to see British horticulturists ape the designs of their Japanese confreres, but holds the view, and would impress it strongly, that we should, like them, endeavour to excel in the art of taking pains, and, moreover, we should aim at producing in our gardens those characteristic touches of colour upon a grey landscape, those informal natural ideas of garden formation, the cultivation of simplicity in its ever-recurring charm, the utilisation of bold groups of colour or greenery, where circumstances demand it. All this will give to our gardens a charm of their own, and secure that elusive something that will distinguish each garden from its fellows.

Should the coming exhibition thus further the progress of garden art, it will be of distinct service to the whole race of garden lovers. P. S. H.

NATURALISED DAFFODILS AT KEW.

As our readers have been fully informed, much attention has of late years been devoted to the naturalisation of daffodils in the Royal Gardens, Kew, and the remarkable success achieved has been such as not only to bring much praise to those responsible for their management, but to materially assist in popularising the grass culture of these and other bulbs. Daffodils have been largely planted in various parts of the gardens, but the principal displays of these flowers are those on the Cumberland Mound, in the Queen's Cottage Grounds, and in the enclosure near the main entrance from Kew Green. We herewith give an illustration of a portion of the great breadth of flowers within the enclosure, and as this so clearly shows the general character of the display, there is no occasion to say a word in its praise. It will be seen that both star and trumpet daffodils have been freely used, and that the association of a few of the best of the two sections have produced a fine effect. On the Cumberland Mound star and trumpet daffodils are also in association, but the latter largely predominate, and in the grounds of the Queen's Cottage the majority of the breadths of flowers are formed by the Emperor. The last-named is sufficiently plentiful in the Pinetum to produce a rich colour effect, and in different parts of the Arboretum are great breadths of flowers of both star and trumpet daffodils, and of the chaste Narcissus poeticus ornatus, each consisting of a distinct variety. It need hardly be said that the naturalised daffodils have, as usual, proved immensely attractive to the visitors who come to Kew in ever-increasing numbers.



NATURALISED DAFFODILS AT KEW.
This "Host of Golden Daffodils" will be found on a stretch of lawn immediately to the left of the main entrance to the Royal Gardens.

FRUIT OF THE SANDBOX TREE.

At the recent meeting of the Edinburgh Botanical Society Mr. Symington Grieve exhibited seeds and remains of the fruit of the Sandbox Tree (Hura crepitans). This tree, he said, belonged to the spurgewort section of the Euphorbiaceæ, and it was indigenous in tropical America. At different places it was known by different names—for instance, at Panama it was named javilia, in New Granada it was habillo, and the general English name was the sandbox tree. It was the only species of hura, and differed from all the other members of the spurgewort family in the many celled ovary and the peculiar structure of the sterile flowers. The tree was branching, of thirty or forty feet in height, and often planted for the sake of its shade, for which it was so well adapted, having a great abundance of glossy poplar-like leaves. The curious, rounded, hard-shelled fruits varied in diameter from 2½ to about 4 inches; they were deeply furrowed, and each swelling between the furrows contained one flattened seed. These fruits were sold as curios in the West Indies, and Mr. Grieve when there acquired a number. He did so quite innocently, being wholly unaware of their explosive nature. He put them in his trunk, and was quite happy in their possession. Had he known what might have happened he would not have felt so comfortable. Fortunately, nothing untoward occurred until he arrived home, when, having unpacked his collections, he proceeded to make various donations to lady friends who liked to adorn their cabinets with things that were strange and rare. One lady friend had a very valuable collection of fragile old glass and china ware in a cabinet with a glass front, into which it was her intention to put the single fruit of hura. Fortunately for the china and the lady's peace of mind, the fruit was put on the top of the cabinet instead of inside it. It lay there for about twenty-four hours, when a fearful explosion occurred, and the whole household rushed to the drawing-room. An investigation showed that there was no sandbox fruit where the sandbox fruit should have been, but it was difficult to realise that most of the remains of the fruit were hanging upon the muslin curtains at least twenty feet away. The husband of the lady called upon Mr. Grieve demanding an explanation, and, having proved his innocence of all evil intentions, the matter ended by Mr. Grieve going to the house to see for himself the results of the explosion. He warned all other friends, to whom he had made presents of hura, to be careful, and not without reason, as within a few days reports came from every quarter of loud explosions of great violence. In only one instance was the fruit kept for any time, and in that instance the core of the fruit was cut out; but one day, about eighteen months after he had presented it, it went off with a bang. Owing to the loud noise made by the explosion, the fruit was often called "the monkey's dinner-bell." The seeds were emetic, in a green state violently purgative, but when dry were said to lose that property. An oil was extracted from them, and sometimes used as a purgative. A venomous, milky juice was abundant in all parts of the plant, and if it be applied to the eye was said to cause almost immediate blindness. The wood of the tree was very brittle, and the hollowed trunks were said to be used in the West Indies as vats for containing cane juice.

GREENHOUSE CLIMBERS.

There are among greenhouse climbers some very interesting subjects. In these days, however, when cut flowers are so much in request, there is a great difficulty in affording them sufficient attention, and as there are but few that produce flowers with stems long enough to enable them to be used with advantage for decorative purposes, they have become neglected. Unless trained to the roof climbers take up much room, and when grown thus close attention is necessary if they are to be kept from overshadowing the plants beneath, but where there are pillars to cover some of the less rampant species may be grown with advantage. Such plants were at one time grown and trained to balloon trellises, and when well flowered they made a fine display at some of our great exhibitions, but as they take up so much room when not in flower they have lost favour.

Some species are very useful, while others are grown on account of their peculiarity. Hibbertia dentata is one of this latter class. The small yellow flowers, which somewhat resemble those of a hypericum, are produced in great abundance during the early spring months, and these form a pleasing combination with the bronzy foliage and dark stems of the young growths. The plant is fairly hardy, and would doubtless withstand our winters in sheltered situations. Here it has the protection of a cold frame during the severe weather. Plants are easily propagated either by cuttings or seeds, so that when once established there is no difficulty in keeping up a stock. It thrives well grown in light sandy soil with the roots kept confined to induce it to flower freely. On no account should it be allowed to suffer from lack of moisture.

Kennedyas are also very pretty when in bloom, their small pea-like flowers being very attractive, and though by no means suitable for cutting, they make fine plants for covering trellis work, pillars, etc., in conservatories. It is easily raised from seed, which should be sown in a gentle heat in spring, and as the plants advance in size they must be potted in sandy peat before the pots are filled with roots.

Solanums are numerous, but the two most useful are S. Wendlandi and S. jasminoides, both of which will withstand the frost of an ordinary winter in the south. They are undoubtedly very useful, the former for its fine trusses of blue flowers, which are produced in abundance during the summer and autumn months, and the latter providing a wealth of bloom out of doors until cut down by the frost. When planted in the open this latter species makes rapid growth, and if allowed to ramble at will over the branches of trees presents a beautiful appearance in the autumn. A deep rich light soil suits it best, for the more liberal the treatment the finer the trusses of bloom.

Clematis indivisa, where space will admit of it being grown to perfection, is astonishing in its wealth of bloom during the early spring. It is, however, a rampant grower, and needs to be cut back each year after it has finished blooming to keep it within bounds. Where there is space, such as the roof of a lofty conservatory, this is just the place for it, as its white flowers then show to perfection. There is no difficulty in increasing the stock of plants by cuttings, and young plants in pots, when in bloom, look very pretty. It thrives well in a light rich soil, and will soon cover a large space if well attended.

Rhyncospermum jasminoides is very nearly hardy, in fact in some places it has withstood the severity of our winters for years, though in some severe seasons it is quite killed. For covering the wall of a greenhouse or conservatory there are few plants more attractive when in full flower. Years ago this was one of the chief kinds in all collections of stove and greenhouse plants at the principal shows, and fine, well-flowered specimens one used to see. Grown in peat the plant makes rapid strides and soon covers a good-sized space, and the dark green foliage is very pleasing even when the plants are not in bloom.

Lapagerias, both the red and white varieties, are grand subjects for covering trellises, walls, etc., in all greenhouses and conservatories, but to grow them well a certain amount of shade is essential, and on no acount must a close atmosphere be given them. I remember some years ago seeing a large plant covering a wall in the Isle of Wight, which, when in bloom, was a grand sight. For covering pillars in a conservatory few plants are more useful, while for exhibition, trained on a trellis, with the large bell-shaped flowers hanging loosely down, both varieties are fine. The flower stems, however, are too short to enable the flowers to be used with advantage for indoor decorations, though for the dinner table they may sometimes be employed with good effect.

H. C. Prinsep.

DAHLIAS IN THE GARDEN.

The dahlia is a show plant of immense value, but it is also meritorious as a beautifier of our gardens, and in this latter capacity we find it properly patronised in but few pleasure grounds. A collection of prize varieties is bought, perhaps, but, instead of setting these where the landscape needs them, or they are able to display themselves to perfection, they are stood in "serried ranks" across some square or oblong plot of uncarpeted ground. Later on, the plantation is made to bristle with upright sticks, topped by inverted pots. Can anything be more ugly, more out of keeping with the royal loveliness, the stately elegance, of this Mexican beauty?

A group of salmon and scarlet dahlias, of any class, in the angle of old grey walls or fences, will make a colour display that will live in an artist's memory; a stiff line of rose and carmine dahlias in front of a red brick house will create a discord that an artist—nay, any moderately artistic person—will recall long afterwards with a shudder. From this fact we gather the truth, that the more we study the laws of art, and observe the perfect manner in which Nature blends her hues, the greater shall we become in our most honourable profession.

Orange and gold dahlias may altogether glorify the aspect of a cold-looking grey or white house; Yellow Colosse is the name of a splendid decorative variety, which produces an incredible number of blooms, and displays them excellently, while the grand orange Glare of the Garden also belongs to this most useful class, being a foot lower than the former it can be massed in front of it. A delightful cactus dahlia, F. H. Chapman, is yellow, flushed with orange; George Gordon actually beats it for beauty, while Harbour Light is an orange that deepens to red at the tips. The range of hue yielded by these cactus varieties is warmer in effect than clear yellow, but that imitates sunshine, as does the golden privet, so is of incalculable worth where a cheering glow is needed.

While some dahlias are thus advisable to brighten scenes, others can be recommended to subdue them, and if we think of the thousands of crude red-brick, red-tiled houses that have sprung up in all country and suburban places, we must admit the need for such flowers. If maroon and white or cream dahlias are boldly massed in front of a dwelling that needs time to mellow down, the immediate appearance undergoes a change as remarkable as it is welcome, and the homestead becomes a scene that would make an agreeable subject for an artist's brush. Dahlias that offer the needed qualifications are the following: Maroon cactus—Good Hope, J. H. Jackson, Dreadnought, and Alexander; show dahlias—Claret Cup, Edward Mawley, Dante, and Mr. Chamberlain; single dahlias—Sambo, Stromboli, and Nellie; cream-white cactus—Fairy and White Lady; show dahlias—Ethel Britton, blush-cream, edged purple, and John Walker; single dahlia—Sevenoaks White.

The effect of a large grass-sided bank of shrubs in a spacious front garden is sometimes far too plain; if a narrow border is cut at the base and dahlias of different classes are grouped in this, to form a continuous line, but broader at places than in others, the improvement will be great, at small cost of labour. When dahlias are required to provide a bold mass of this sort every effort should be made to hide the soil between and before them now, as the strongest growers ought not to be overcrowded by one another, the best way of achieving this is to use pompons and Tom Thumb dahlias also of the most dwarf description.

Pompons only two or two and a-half feet high are: Arthur West, crimson; White Perfection; Zerlina, maroon-crimson; Bacchus, scarlet; Bonelia, rose; Kitty Barrett, yellow, tipped red. Tom Thumb dahlias, of scarcely more than a foot in stature, are: Golden Fairy; Tom Tit, orange; White Pet; and Mignon, pink. Then there are dwarf bedding cactus dahlias, not above two feet high, of which John Mortensene, crushed strawberry, is the loveliest, but of a shade that is a discord with all pink, crimson, scarlet, or orange flowers; Citronenvogel, primrose; Edelweiss, white; and Perkes, deep gold, can be obtained.

Hedges of dahlias are quite suitable for making summer screens in the garden, adding to the privacy of arbours and seats, surrounding croquet and tennis lawns, hiding the vegetable ground, or separating a front lawn from the tradesman's entrance path. The tallest dahlias I know are: Magnet, salmon-apricot; Flash, scarlet; Salisbury White; and the cerise-vermilion Souvenir de Gustave Douzon, which reaches beyond five feet. Paeony-flowered varieties are plentiful, and include La Riante, heliotrope; Baronne de Grancy, white; Pius X., yellow; and Queen Emma, pink. It is well known that seed-raised single dahlias often tower high above all others; it would be worth while to make a hedge each year of seedlings from the best seed, for the colours and shape would prove admirable, from the artistic and the gatherer's point of view, as well as exquisite for garden adornment.

By using dwarf kinds of dahlias in some of the lawn beds we can get away from the bedding-out schemes that are surely, though slowly, passing from public favour. All that pompons, Tom Thumb, and dwarf cactus varieties need is an edging of violas; yellow, mauve, or white are bound to harmonise with the hues of the more important flowers.

M. H.

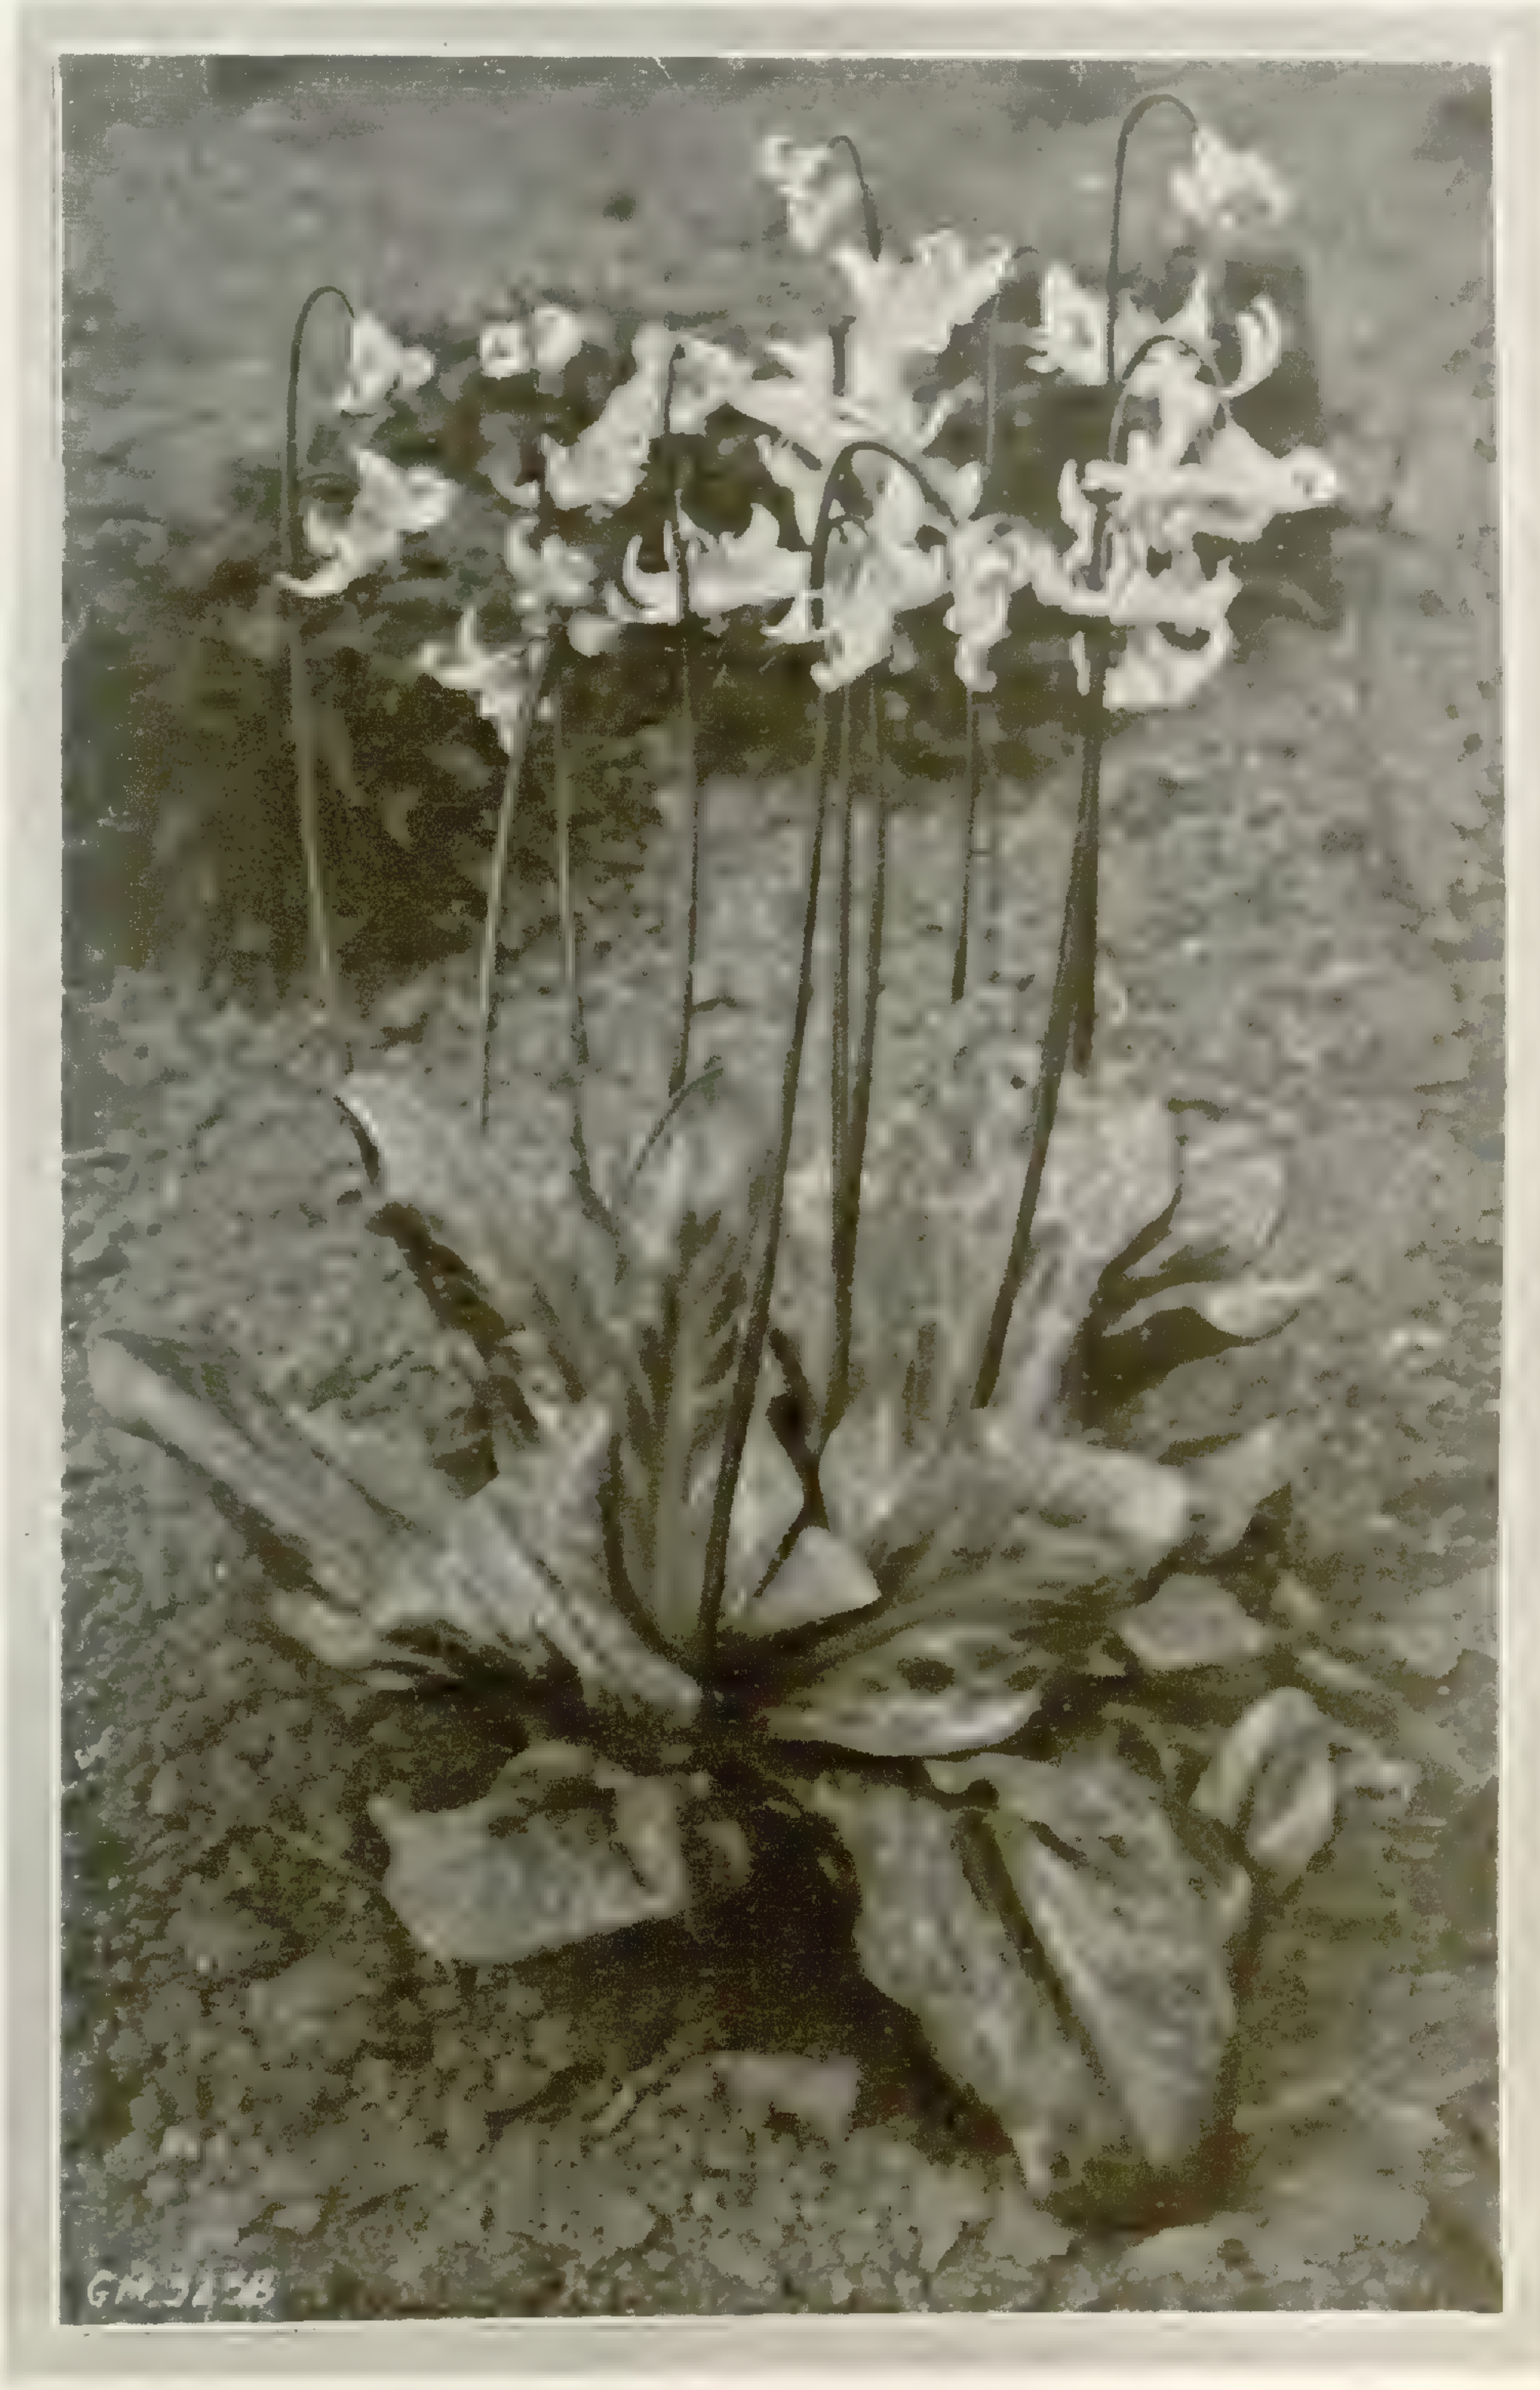
AMERICAN ERYTHRONIUMS.

The European Dog's-tooth Violet (Erythronium dens-canis) and its varieties form a small but attractive group of spring-flowering plants that well deserve a place in all gardens in which hardy flowers are appreciated. Attractive as they unquestionably are when grown under conditions favourable to their full development, they are, in some respects, surpassed in effectiveness by their more robust relatives that have been introduced from the other side of the Atlantic. The object in mentioning this fact is not to depreciate the merits of the charming European plant, that has been grown in this country for at least three hundred years, but rather to indicate the value of the American species in contributing to the attractions of the herbaceous border and the rock garden during the spring months. All that are in cultivation in this country are more or less beautiful, and they are all comparatively cheap. This being the case, lovers of hardy flowers who have not as yet grown the American erythroniums may be advised to visit nurseries where they are cultivated in considerable numbers, or botanic gardens, as may be the most convenient, and make the acquaintance of the finer forms. This having been done, they should take down a bulb catalogue containing a representative collection, and duly mark those for which they have a preference, so that everything may be in readiness for making purchases in September or October.

The following are of great beauty, and those who are able to visit nurseries or gardens in which there are representative collections should make a point of looking for them, while those unable to do so should mark a catalogue forthwith, and purchase the roots in the autumn. E. americanum, a dwarf-growing species, bearing yellow flowers that are marked with brown at the base: E. citrinum, a distinct and pretty species, with lemon-coloured flowers; E. grandiflorum giganteum, a bold-growing form of great beauty, which by some writers is given specific rank under the designation of E. giganteum. It is vigorous in growth, the large leaves are richly marbled with bronze-purple, and the flowers, which are borne on comparatively tall scapes, are cream-white, orange-yellow at the base. E. grandiflorum is hardly so tall as the form immediately preceding it, but the flowers are borne erect on stout scapes, and they are of large size, and of a rich yellow hue. E. Hendersoni is valuable for its distinct colouring, and is of much beauty. The leaves are deep green mottled with brown, and the flowers are pale rose with purple base. Not less beautiful or desirable is E. revolutum Johnsoni, which has large rose-coloured flowers with golden centre. These would form an excellent selection, and give much pleasure during March and April.

The American erythroniums are not, in the matter of cultivation, exacting in their requirements, and there are comparatively few gardens in which they cannot be successfully grown without elaborate preparations being made for them. They will thrive in any light friable soil, but the soil that is the most suitable for them is a light sandy loam, to which a rather small quantity of peat and a liberal proportion of leaf-mould have been added. The several kinds should be arranged in distinct groups, and each should contain from six to nine roots to ensure a good effect from the first.

W.



ERYTHRONIUM GRANDIFLORUM GIGANTEUM.

A beautiful variety of one of the finest of the American species; the flowers rich cream colour with orange base.

PRUNUS JAPONICA.

Until about ten years ago this dwarf cherry was only known in gardens by its double-flowered varieties, but Messrs. Veitch received seeds of the type from their collector, Mr. E. H. Wilson, and were successful in raising plants about the beginning of the century. Curiously, amongst the earliest plants which flowered were noted both white and pink or reddish-flowered forms, which correspond with the two double-flowered kinds. After being used to the flowers of the latter, those of the type were somewhat disappointing, for, though borne with freedom, they are much smaller than those of the varieties, and are of a more fugitive character. This, however, is compensated for, to some extent, for the flowers are followed by ornamental fruits as large as those of a small cherry, and similar in colour, though on different plants the colour may be bright red or dark red, as the case may be. The fruits are fairly fleshy, and of an acid taste. It is probable that they might be used for culinary purposes if they were obtainable in sufficient quantity. The species is a native of both China and Japan, and has been called P. chinensis in addition to P. japonica. The double-flowered varieties are exceedingly useful flowering shrubs, for they rarely fail to blossom freely, whilst they may be used successfully in beds in conspicuous positions, groups in shrubberies, or for forcing.

Under normal conditions they grow between five and six feet high, but it is a mistake to allow them to get too tail, for then the growths become short, and flowering suffers. The best way to deal with them is to cut them well back about every third year. By doing this long shoots are formed, often from two to three feet in length, and these bear blossoms throughout the greater part. It is sometimes found to be a rather difficult shrub to propagate, especially when raised from cuttings. The type may, of course, be increased by means of seeds, but the double forms have to be dealt with in some other way. The most satisfactory is layering, and if two or three are layered in spring good serviceable young plants may be obtained by autumn. These, taken off, and planted in nursery quarters for a year, form excellent shrubs, either for planting in the open ground or for forcing. Those used for the latter purpose may be forced two or three years running, providing care is taken to grow them on in a cold house for two or three months after the flowers are over. Treated in this way it proves a very profitable subject.

D.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLINGS from seeds sown early in the year will now have advanced to that stage of growth when they may be removed from their seed beds and transplanted into small pots, singly, or placed several together in store pots. Where seedlings are extensively raised, the question of accommodation soon arises. It is not so much the question of accommodation in the early stages of growth as it is when the plants are in a more advanced state, and in advising on this question it is scarcely necessary to say that it is well, where room is limited, to keep the young plants in as small a space as possible. It is remarkable what a difference a year's growth makes to a dozen plants which in their early stages may be accommodated in a three-inch pot. On the other hand, where ample accommodation can be afforded, I have no hesitation in saying that the seedlings should be allowed to remain on the seed bed until they are sufficiently advanced to be planted singly in small pots. Where they can be thus treated they have the advantage of being treated individually, and will usually outrun plants that are pricked off several together in the store pots.

TRANSPLANTING. – I am frequently asked which is the best time to remove young plants from their seed bed; this is a matter which must be left largely to the discretion of those in charge of the plants. Circumstances necessitate prompt action at times, as the surface of a seed bed may become subject to attacks of one or more fungi, after germination has considerably advanced; or the potting compost may decay, or the sphagnum moss and other vegetable growth become so overgrown and dense that there is a danger of the loss of all the young plants. These are frequent occurrences, and serve to show that the time of removal must be judged on the spot. I think when all goes well the best time to remove young seedlings is when the first root is being emitted, and this usually follows the complete development of the first leaf. When potting seedlings from the seed bed, and in the early stages of growth, I find it is desirable that the compost should be of a loose and porous nature, so that water may drain off rapidly and the air may have passage through the material. Care should also be observed to have the pots and drainage thoroughly clean.

ODONTOGLOSSUM SEEDLINGS.—Until the last few years raising odontoglossums from seed with any degree of success appeared out of the question. The developments in this direction have been most remarkable, and we find that no orchid seeds germinate more rapidly to-day than those of odontoglossums and allied genera. Why this should be it is difficult to determine, for apparently the conditions of culture are the same as previously, with the exception, perhaps, that a little leaf-soil is included in the potting compost. Seedlings raised in the late months of last year, and the early months of this year will now require attention. The outside damp conditions have had considerable influence on the seedlings here during April. It is when they get to the stage of early leaf development that they are attacked by blackfly maggots and small slugs, and in this state they must have constant observation.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

PROPAGATION.—The greater proportion of plants will have now been raised either by seed or from cuttings, and many of them will be making vigorous growth. Yet there are many things that will need to be propagated regularly to keep up a supply of small furnishing stuff either for the houses or for indoor decoration, so that it is not wise to let the propagating frame stand idle for any length of time. Coleus, panicum, tradescantia, Ficus repens variegata, and various selaginellas are all particularly useful, so that whenever there is room to spare batches of these should be put in, using pots of a size best suited to one's requirements.

ASPARAGUS TENUISSIMUS.—This is one of the most useful and graceful of all the asparagus, and one that is easily propagated by means of cuttings, which may be put in at this season. Small side growths should be taken off with a portion of the old growth attached, and either pots or pans may be used to put them in, the one essential being a very light sandy compost. With a brisk bottom heat they will root quickly. Pot off as soon as they are well rooted, and if kept growing and shifted into 48's or 32's when fit, they should make a batch of really useful plants by the autumn, and their very light and graceful leafage is particularly adapted for use with all kinds of cut flowers.

THYRSACANTHUS AND RUELLIAS.—Cuttings of these two useful winter-blooming plants should now be put in, using a compost of equal parts of fine loam, leaf-soil, and sand. Though they are generally regarded as stove plants, and certainly require stove temperature during the autumn and winter months, they may, after being potted off into 60's, be transferred to a warm pit for the summer months, where they should, as a matter of course, be treated pretty liberally as regards heat from the sun, and the temperature must not be allowed to fall low at night. Shading will be necessary during the hottest part of the day, and the morning and afternoon syringing will greatly benefit them.

ACHIMENES.—These very pretty stove or warm greenhouse plants should be starting into growth nicely by now, but those that have not already commenced to grow should be shaken from the old soil, and if wanted for pots or pans should be potted straight off into the receptacles they are to flower in, placing the corms from 1 to 2 inches apart, and about three-quarters of an inch beneath the surface of the soil. The latter should be like the material used for gloxinias. If required for furnishing baskets they should be started either in pans or boxes, transferring them to the baskets as soon as they have made about two inches of growth; they may then be drawn through the wires of the basket wherever desired, thus furnishing the bottom as well as the top. After getting well into growth they will need plenty of water at the roots, but a too hot, humid atmosphere is not necessary, as the stiffer the young growths are kept the more likely are they to flower freely. Staking should be done with small tips of bamboos or hazel twigs before the growths begin to fall about, and as they come into bloom a little help may be given them in the way of weak liquid manure. About the same temperature and moisture will suit them as is given to gloxinias.

STOVE CLIMBERS.—The past week or two of mild weather has made these grow apace, and constant attention must be given to tying the young growths, or many of them will be preventing the light from reaching plants growing beneath them. Where space is limited some of the weaker growths should be cut out, leaving those that are most likely to bloom early.

POINSETTIAS AND EUPHORBIAS.—Batches of cuttings should be taken as soon as they are ready; have pans of fine dry sand handy in which to place the heel of each cutting as soon as it is removed, as this prevents bleeding. Afterwards place the cuttings singly in thumb pots in a very light compost, put them in a propagating frame, and keep lightly sprayed and shaded, when they will soon make root.—T. Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

ORCHARD HOUSE TREES.—Fruit trees in pots now commencing to swell their fruits will be making active top and root growth and require close attention to watering, as well as occasional applications of diluted liquid manure. A liquid for the purpose can be made by submerging bags containing sheep or deer manure, together with soot, in a tank of water. The thinning of stone fruits, such as plums, peaches, and apricots that have set freely should be commenced early, and be discreetly followed up, but apples and pears, which are more prone to cast their fruit, should be left unthinned until swelling freely. The thinning of shoots should be completed, and those left, except what are required for the tree's extension, be stopped at about the fifth leaf. Syringe the trees freely on fine days, maintain a moist atmosphere by damping the floor of the house, and should aphis be troublesome, destroy it by vaporising. Ventilate the house liberally by day in favourable weather, and slightly on mild nights, and even if it is desirable to forward the crops, use no more fire-heat than is sufficient to slightly warm the pipes.

LATE PEACH HOUSE.—The fruit from this house is especially valuable where outdoor peaches and nectarines are not cultivated, and in such cases, even where the latest varieties are grown, it will be necessary, in order to secure a late supply of fruit, to retard the fruits as far as possible by commencing to ventilate the house early, fully opening its ventilators during the warmest part of the day, and not finally closing them until the temperature has fallen to 55 deg. In cases, however, where it is desirable to advance the ripening of the fruit, the sun's warmth should be carefully economised, but only in exceptional instances should artificial warmth be employed. The disbudding of shoots will have been nearly completed, and care should be taken in tying in next season's bearing wood to thin it, if it is found necessary to do so to prevent crowding. In the case of young trees, train at about five inches apart sufficient of the best-placed side shoots to furnish the base, and in doing so study to lay their foundations perfectly. Owing to last year's unfavourable weather for ripening the wood, the fruit will be unusually liable to gum, and consequently there is more than ordinary reasons for delay in carrying out the final thinning.

STRAWBERRIES.—From this date plants growing in pots usually swell and ripen their fruit more satisfactorily in a structure facing east than when exposed to direct sunshine in one having a southern aspect. The watering is also lessened, and red-spider less troublesome, though on no account must needful supplies of water and diluted liquid manures, or the syringing of the plants on fine days be neglected. Syringing and manures should be discontinued once the fruit begins to ripen. Plants still outside, and intended for late crops of fruit, are now pushing up their flower spikes, and should be protected from frost, and afforded needful supplies of water and liquid manure. Batches should be introduced under glass, as required to keep up supplies of fruit, and when hardened, after fruiting, selections, if needed, should be made from them for planting in open quarters.

MELONS may now be planted in properly-prepared frames, upon warm hillocks, or ridges of soil placed rather nearer to the back than the front of the frame. Place the plants at equal distances apart—two to each light—and train two growths from each plant, one towards the back, and the other towards the front of the frame. Carefully ventilate the frame on fine days, and entrap the sun's warmth by closing early, at which time spray the plants and interior of the frame with tepid water. Well protect with mats at night. — T. Coomber, The Hendre Gardens.

GREENHOUSE MANAGEMENT. The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the house and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE PERPETUAL-FLOWERING CARNATION SOCIETY.

The SPRING SHOW OF CARNATIONS will be held in the ROYAL HORTICULTURAL HALL, Vincent Square, Westminster, S.W., on THURSDAY, May 19th.

Admission from One to Six p.m., One Shilling.

Schedules and particulars from Mr. E. F. HAWES,
Royal Botanic Gardens, London, N.W.

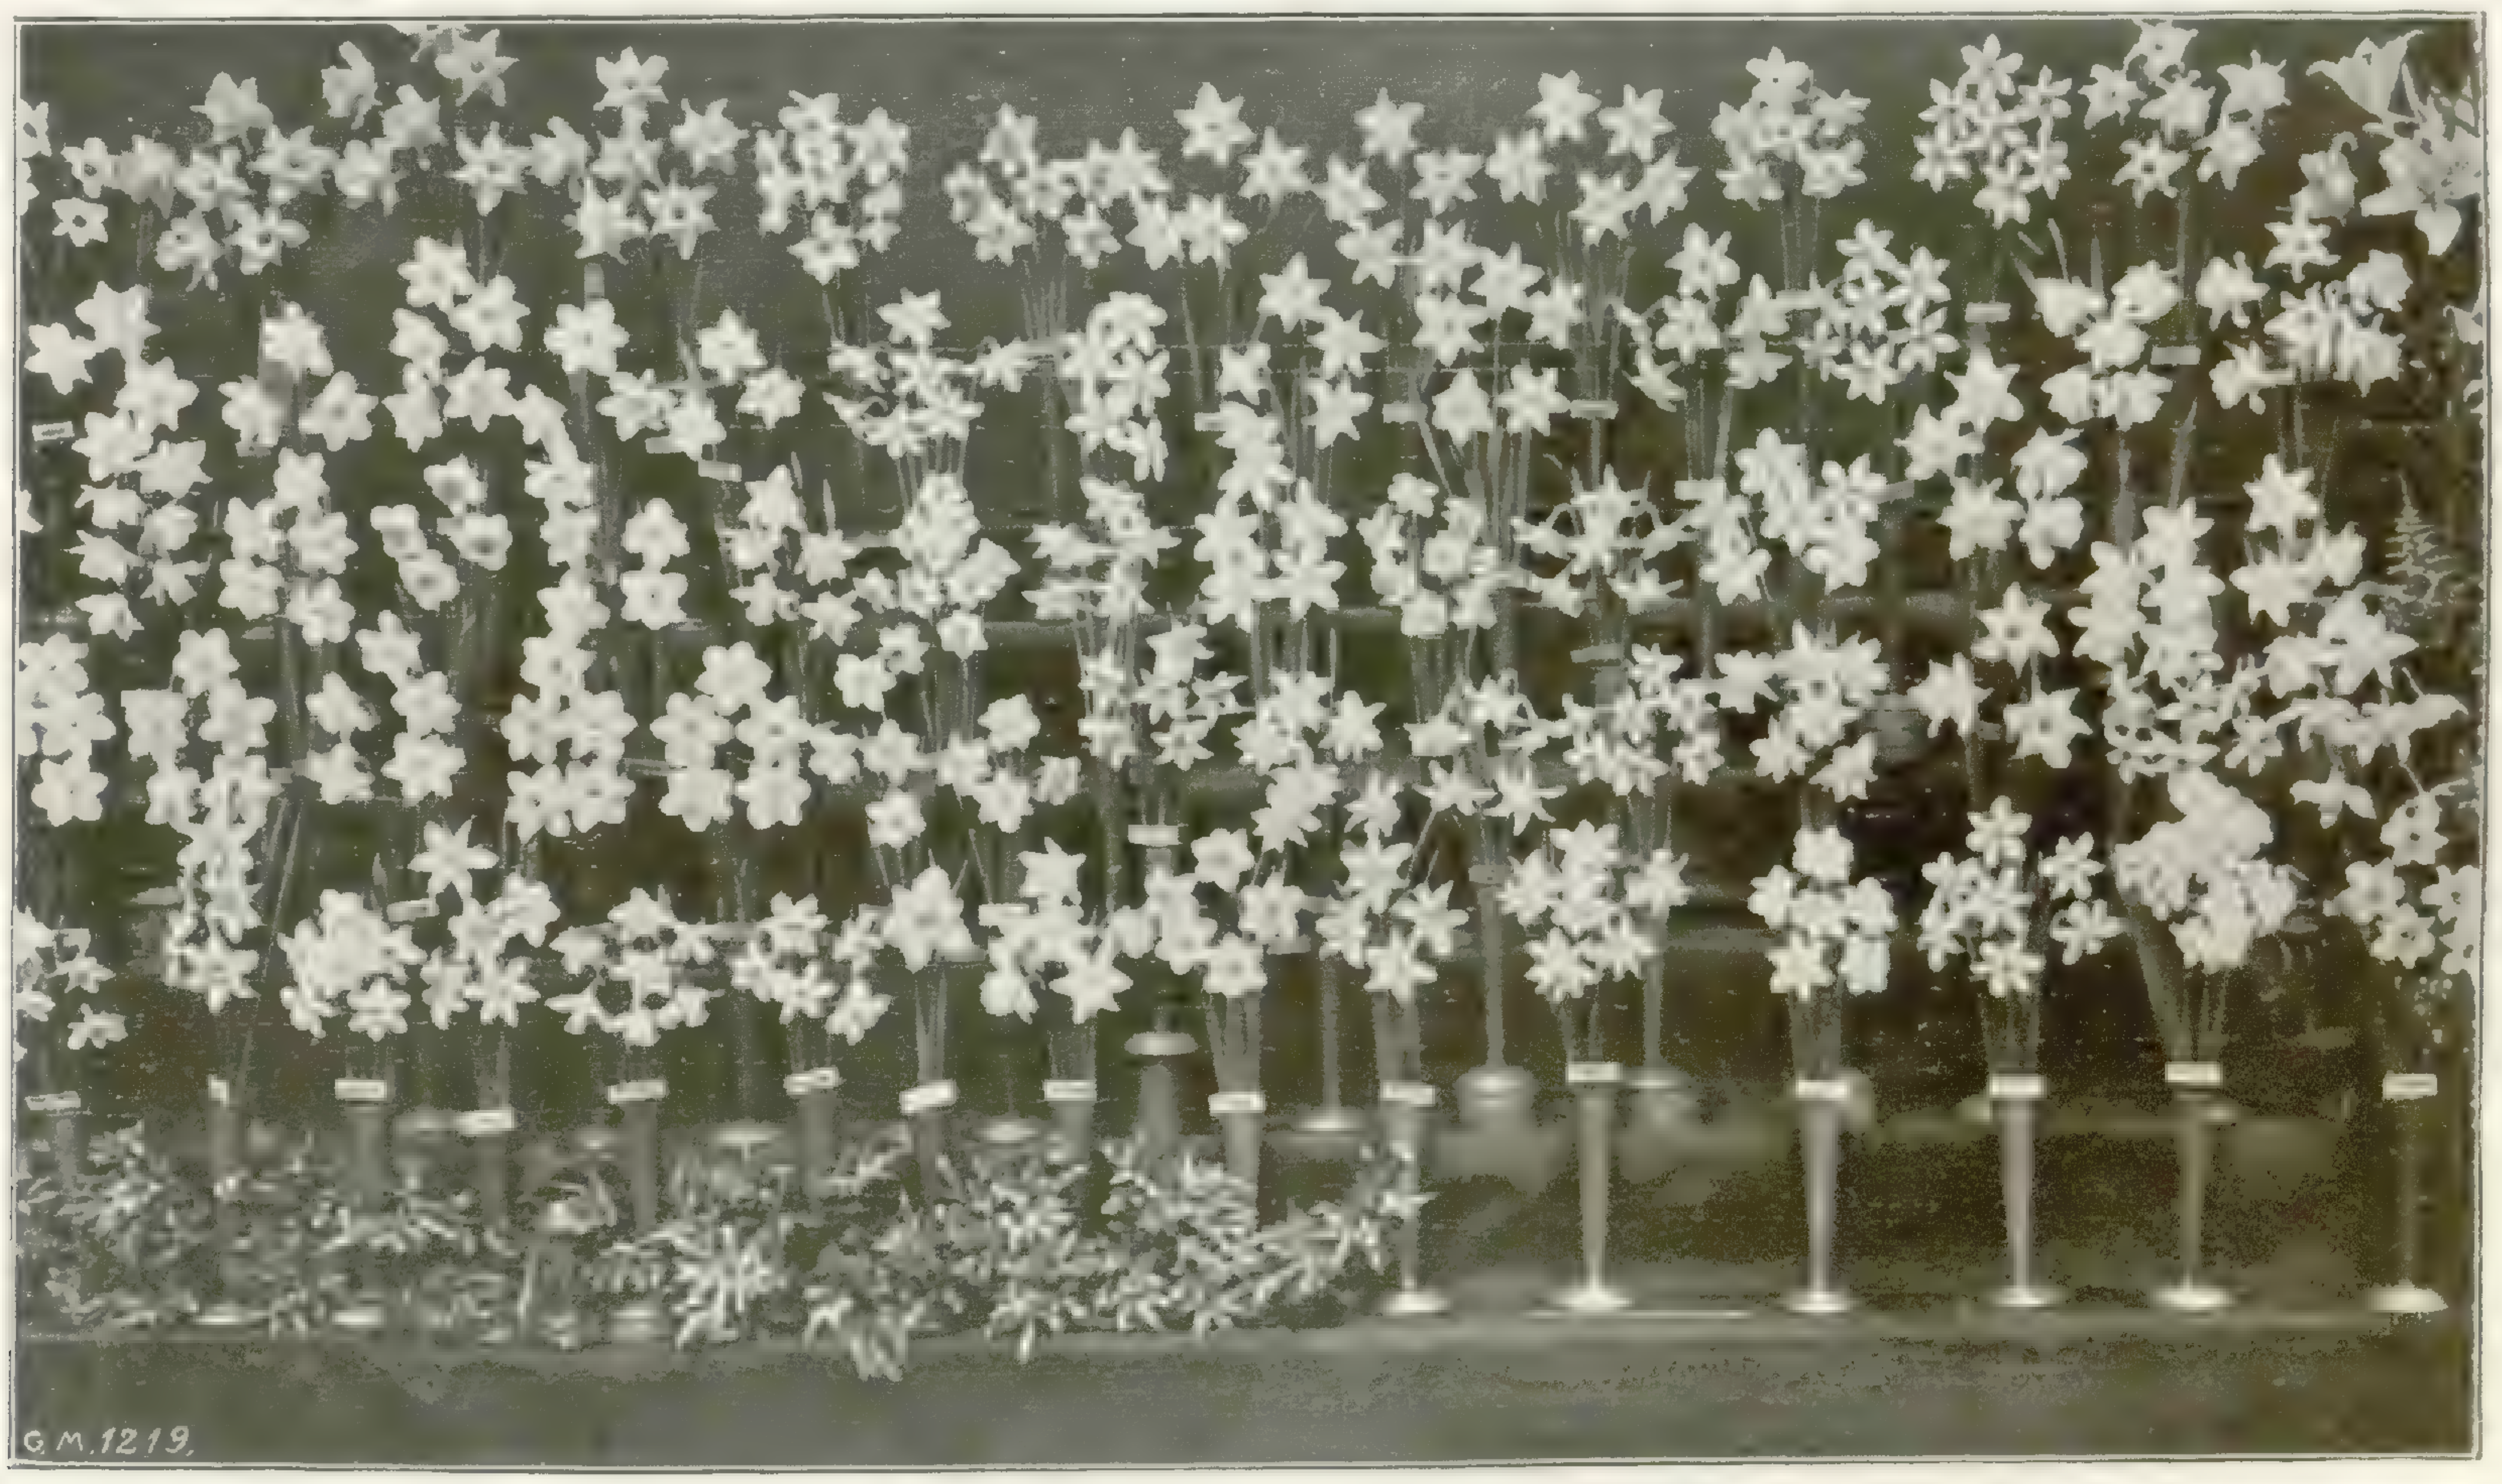
HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

The Midland Daffodil Society.

The twelfth annual exhibition of the above society was held in the Botanic Gardens, Edgbaston, Birmingham, on Thursday and Friday, April 28 and 29, and was generally considered to be larger and better than any of its predecessors. The entries in the competitive classes established a record, and the non-competitive exhibits were numerous and excellent. The Lady Mayoress, who opened the show, was presented with a silver rose bowl, the Rev. G. H. Engleheart, president of the society, making an appropriate speech.



A FINE COLLECTION OF NARCISSI.
Contributed by Messrs. Robert Sydenham, Lim., to the Midland Daffodil Society's Exhibition.

The schedule opened with a class for fifty varieties, representing the different sections, excepting bunch-flowered varieties, and here Messrs. Cartwright and Goodwin, Kidderminster, secured premier honours with a grand lot of blooms. A few of the varieties worthy of note were Marigold, Diana, Cornelia, Dorothy, and Childe Harold, but every vase contained a good variety. Mr. J. Pope, The Ericas, King's Norton, was second, his Sulphur Prince, Will Scarlet, and King's Norton, being very fine; third prize was allotted to Mr. F. H. Chapman, Rye, Sussex, who had Cristata, Seahorse, Orangeman, and others in good form; Mr. Christopher Bourne, Simpson, Bletchley, came fourth, his Sahara being much praised. For twelve trumpet daffodils Messrs. Cartwright and Goodwin won with a nice collection: Van Waveren's Giant was conspicuous in this group. Mr. J. Mallender, Bawtry, was second, Sybil Foster and Merry Widow being well shown by him; Messrs. F. Impey and Sons, Northfield, were third; and Mr. J. Pope fourth.

Messrs. Cartwright and Goodwin also won first place for six short trumpets, the Rev. J. Jacob, Whitchurch, being second, and Mr. J Pope third. The Rev. J. Jacob had the best dozen large-cupped varieties in a strong class, his blooms showing fine culture; Mr. H. D. Phillips, Olton, second; Messrs. Cartwright and Goodwin, third; Mr. J. Pope, fourth; and Mr. C. Bourne, fifth. For twelve small-cupped varieties Messrs. Cartwright and Goodwin were again to the fore, showing White Slave, Inga, Dorothy, etc.; Rev. Jacob came second; and Mr. C. Bourne third. Mr. F. H. Chapman led for six, distinct, true poeticus varieties, his Tennyson and White Elephant being beautiful; Messrs. Cartwright and Goodwin, and Mr. Bourne took second and third prizes. Messrs. Cartwright and Goodwin won in the class for six flat-cupped varieties, and Mr. J. Pope was second; these competitors maintained the same order for six double varieties. For six bunch-flowered varieties Rev. J. Jacob led, Messrs. Cartwright and Goodwin following.

A class was provided for twenty-five varieties of daffodils, including all sections, to be staged by amateurs, and the varieties staged were not to be more expensive than 10s. 6d. each. The competition proved very keen in this class, Mr. E. H. Wood, Ludlow, being the victor with a lovely lot of blooms; Mr. N. Y. Lower, Presteigne, was second; the Rev. F. Buncombe, Black Torrington, North Devon, third; Mr. S. S. Jones, Whitchurch, fourth; and Mr. H. R. Darlington, Potter's Bar, fifth. For nine distinct varieties, long trumpets, Mr. N. Y. Lower, Presteigne, led; Mr. H. R. Darlington was second; and Mr. S. S. Jones, third; and Mr. J. A. Kenrick, Edgbaston, fourth.

In the class for three distinct short trumpets, Mr. N. Y. Lower led with Mr. H. R. Darlington second. Nine distinct large-cupped daffodils made a good class that brought out eight entries, of which Mr. N. Y. Lower's was adjudged the best; his flowers were large and clean; Mr. H. R. Darlington, second; Mr. J. A. Kenrick, third; the Rev. C. P. Haydon, fourth; Mr. S. S. Jones, fifth. Nine small-cupped daffodils proved another strong class, and brought out seven good entries; here Mr. N. Y. Lower was first, Rev. T. Buncombe second, Mr. H. R. Darlington third, Mr. S. S. Jones fourth, and Rev. C. P. Haydon fifth. The class for three true poeticus daffodils found Mr. H. R. Darlington first, Mr. N. Y. Lower second, Mr. S. S. Jones third, the Rev. G. P. Haydon fourth. The Rev. G. P. Haydon led for three distinct flat-cupped daffodils, his Barnowl being very noticeable; Rev. T. Buncombe second, and Mr. N. Y. Lower third. Mr. J. A. Kenrick, Edgbaston, led for three distinct double varieties with Sulphur, Golden, and Orange Phœnix; Mr. Kenrick, Harborne, second; and Mr. W. H. Parton, Hollywood, third. Mr. H. R. Darlington scored for three bunch-flowered varieties; Mr. S. S. Jones, second; Mr. J. A. Kenrick, third.

Another group of classes was open only to those who have never won more than three first prizes at any of the society's shows. The competition in these classes was very keen, and much interest was taken in them. For twelve, distinct, three blooms of each, first prize went to Mr. H. H. Jones, Ludlow, whose varieties included Peach, Captain Nelson, Mdme. Plemp, etc; Mr. W. Marple, Penkridge, second; and Mr. A. Taylor, Acocks Green, third; and Mr. C. F. Thurstan, Wolverhampton, fourth; there were nine entries. Six distinct varieties, long trumpets, brought out nine entries, Mr. A. Taylor leading, Mr. H. H. Jones second, Mr. W. Marple third. For six large-cupped daffodils, Mr. B. Brown took first prize, and for six small-cupped Lady Lilford won, with Mr. B. Brown second.

A class for six vases of popular varieties, arranged for effect, was a capital idea, but we thought the exhibits should have made a more artistic display. Mr. J. Pope won, his flowers and foliage being lightly arranged; second prize went to Mr. W. Marple, and third to Messrs. F. Impey and Sons.

In the single bloom classes the best long-trumpet yellow self was Lord Roberts, staged by Messrs. Cartwright and Goodwin, the best long trumpet of another colour was Maud Muller, a pale bicolor, Mr. A. M. Wilson, Bridgwater, being the exhibitor; Mr J. Mallender had the best short-trumpet, Maral being the variety; Mr. H. D. Phillips, Olton, won for a large-cupped flower with Homespun; Inga won the small-cupped class for Messrs. Cartwright and Goodwin, and in the flat-cupped class the same exhibitors won with White Star, a lovely flower rare quality. Mr. E. M. Crosfield's Snow King was adjudged the best of the true poeticus varieties.

Great interest, of course, centred round the classes for seedlings and new varieties, and a good deal of enthusiastic comment was passed upon the twelve remarkable blooms with which Mr. E. M. Crosfield won the Bourne Challenge Cup. The stipulation in this class was that the twelve should all have been raised by the exhibitor. A gold medal goes with the cup. An exquisitely-formed poeticus named Elf, and a larger, beautifully-eyed flower, named Challenger, were universally admired, while the cream-trumpet Climax was also highly praised. Mr. F. H. Chapman, Rye, secured the piece of plate offered as second prize, Equinox, Caramel, and Henry James being staged with some seedlings under number. The Rev. G. P. Haydon, Canterbury, was third with some capital cream self and rich yellow trumpets.

In a class for six sorts, raised by the exhibitor, Mr. P. D. Williams, St. Keverne, led, his varieties being of the flat-cupped form, and showing rich quality. Mr. A. M. Wilson had six really good things on his second prize stand, Lapwing being very distinct; Mr. J. Pope was third; and Mr. C. H Cave, Mangotsfield, fourth. The first prize for three varieties, raised by the exhibitor, and not yet in commerce, went to Mr. A. M. Wilson, and in the Cartwright Challenge Cup class for twelve varieties that have been in commerce not more than four years, Mr. E. M. Crosfield scored, Messrs. Cartwright and Goodwin being second, and the Rev. G. P. Haydon third. For six varieties, similarly qualified, the Rev. J. Jacob won, followed by Mr. J. Pope and Mr. F. H. Chapman. The Herbert Chapman Trophy for poeticus varieties went to Mr. A. M. Wilson, the pieces of plate for second and third prizes going to Messrs. Cartwright and Goodwin, and the Rev. G. P. Haydon.

The Walter Ware Cup for a group of triandrus hybrids went to Mr. E. M. Crosfield.

The classes for pot-grown bulbs and bulbs in bowls of fibre, provided by the society and by Messrs. R. Sydenham, Lim., brought good entries that added a distinct note of colour to the exhibition. Limits of space unfortunately forbid detailed mention of these classes.

A large number of new seedlings were placed before the judges, who voted awards of merit to Mr. Chapman's Kingsley and Mr. Crosfield's Challenger, Firetail, and Anchorite, Messrs. Barr and Son's Snow King, and Messrs. Cartwright and Goodwin's White Star.

NON-COMPETITIVE.

The first-rate exhibits staged by the trade, and raisers, commanded highest eulogies from all who saw the show. We would gladly give our readers a detailed account of every exhibit, but that is impossible, a brief reference to the more noteworthy varieties being all that we have space for. A few of the outstanding varieties staged by Messrs. Barr and Sons, Covent Garden, London, were poeticus Snow King, and Socrates, bicolors Cygnet and Czarina, and the rich yellow trumpet Hamlet. Many other good things were staged by this firm. Messrs. Robert Sydenham, Lim., Birmingham, as might be expected, came forward in fine style with an exhibit of all classes of daffodils, tulips, anemones, lily of the valley, etc., etc. A few of the more noticeable were Homespun, Seville, Peveril, Cavalier, J. T. Bennet-Poe, and Red Crest. About sixty varieties were well staged by Mr. Alex. M. Wilson, Shovell, Bridgwater. A huge yellow trumpet called Berseker, a chaste white incomparabilis named Casilda, and a poeticus variety named Kestrel were noteworthy.

Space forbids adequate mention of the grand display of novelties staged by Rev. G. H. Engleheart, Dinton, Salisbury. Our readers are aware that when this noted raiser shows a new seedling, it is a good one, and on this occasion quite a hundred varieties were put up. Huge trumpet flowers of pale shades were particularly fine, this section being Mr. Engleheart's latest love. Clean and perfectly developed were the many varieties of choice narcissi exhibited by Messrs. J. R. Pearson and Sons, Lowdham, Notts. Prima Donna, White Queen, Lord Roberts, and Scarletta stood out conspicuous. In striking contrast to the yellows and whites of the narcissi were a number of vases of Muscari botryoides Heavenly Blue, the spikes being unusually large. From Messrs. Dicksons, Lim., Chester, came daffodils in variety, and a group of the graceful little Primula malacoides, a plant that bids fair to become very popular. Messrs. R. H. Bath, Lim., Wisbech, staged a collection which once more forcibly demonstrated the fact that Lincolnshire soil is capable of producing daffodils of highest quality. Ireland was well to the fore with fine exhibits from Messrs. Hogg and Robertson, Lim., Dublin, and The Lissadell Bulb Farm, Sligo. Among other good things noticed on Messrs. Hogg and Robertson's stand were Ireland's Eye, a new flat-cupped variety, with splendid symmetrical petals, and a large yellow crown, edged with orange; Mrs. C. R. Hamilton, Gold Eye, Evangeline, and Poetaz Orient. Among the best of the Lissadell blooms were Mrs. Percy Foster, a large, distinct, and attractive flat-cupped flower; Acme, with deep orange eye; and Joseph Sangster, a bicolor incomparabilis of good form and substance. The position of this stand was unfortunately in a bad light, and the flowers were consequently seen at a disadvantage.

An attractive and interesting display of narcissi, tulips, and other bulbous flowers was arranged by Messrs. R. Wallace and Co., Colchester. Two glorious yellow trumpet seedlings, several good flat-crowned varieties, and the poeticus variety Kingsley, one of the gems of this section, were prominent. Fritillarias, erythroniums, etc., were freely used in conjunction with seasonable alpines. A batch of extremely good hybrid polyanthus came from Mr. S. Mortimer, Rowledge, Farnham. The plants were arranged in batches of distinct colours, clear white, rich golden yellow, bright red, and deep velvety-crimson. Messrs. Felton and Sons, Hanover Court, London, put up a grand lot of the Lyon rose, and some lovely hybrid gerberas, in shades that blended perfectly with the distinct shade of the rose. A varied collection of alpines, arranged on an improvised rockery of tasteful design, came from Messrs. Bakers, Lim., Wolverhampton. In addition to varieties of aubrietia, saxifraga, and other popular favourites were nice patches of Primulas Cockburniana, P. rosea grandiflora, P. japonica, and some hardy cypripediums.

Messrs. Sutton and Sons, Reading, arranged a group of cinerarias of both large-flowered and stellata types. The plants were well-flowered, and the colours rich and varied. Mr. Vincent Slade, Taunton, Somerset, put up a good collection of cut zonals, embracing the best of both double and single varieties. Mr. H. N. Ellison, West Bromwich, put up a table of choice ferns, among which crested nephrolepis were to the fore. A new dracæna with exceptionally stout leaves, and yellow variegation was also shown.

EVENING MEETING.

The principal competitors, judges, and visitors were entertained to dinner at the Grand Hotel in the evening of the opening day by Mr. Robert Sydenham. The chief speakers were Rev. G. H. Engleheart, Mr. P. D. Williams, Mr. Walter T. Ware, Mr. P. R. Barr, Mr. Robert Sydenham, Mr. G. H. Van Waveren, and Rev. J. Jacob.

A discussion followed the formal programme, and it was opened by Rev. G. H. Engleheart, who spoke of the posibilities of daffodils in regard to form, size, and colour.

SPECIAL AWARDS.

Messrs. Barr and Sons' silver daffodil vase was won by Dr. N. Y. Lower, Presteigne, as the most successful amateur. The large silver medal as champion prize for greatest number of points in classes 2 to 9, and 26 to 33 went to Messrs. Cartwright and Goodwin; the bronze medal, as second prize, to Rev. J. Jacob; silver medal for second champion of classes 11 to 18 and 26 to 33, Dr. N. Y. Lower; bronze medal, Mr. Darlington. Silver medal for most successful exhibitor in classes 26 to 33, 35 to 37, 39, and 42 to 47, Mr. A. Cryer, gardener to J. Kenrick, Esq; bronze medal, Mr. R. Usher, gardener to J. A. Kenrick, Esq.

AWARDS IN NON-COMPETITIVE SECTION.

Gold Medal. — Messrs. Bakers, Wolverhampton, for rockwork; Miss Currey, Lismore, for daffodils.

Silver-Gilt Medal.—Messrs. Barr and Sons, London, for daffodils; Rev. G. H. Engleheart, Dinton, Salisbury, for seedling narcissi; A. M. Wilson, Esq., North Petherton, for daffodils; Messrs. Felton and Sons, London, for roses and gerberas; Messrs. Sutton and Sons, Reading, for cinerarias.

Large Silver Medal.—Messrs. Pearson and Sons, Lowdham, for daffodils; Messrs. Robert Sydenham, Lim., Birmingham, for daffodils, and a collection of bulbs in fibre; W. A. Watts, Esq., St. Asaph, for seedling daffodils; Messrs. Hogg and Robertson, Dublin, for daffodils; Mr. W. T. Ware, Bath, for selection of Narcissus poeticus varieties; Messrs. R. Wallace and Co., Colchester, for daffodils, tulips, and rock plants; Mr. S. Mortimer, Farnham, for polyanthus.

Silver Medal.—Mr. H. N. Ellison, West Bromwich, for ferns; "Lissadeil," Ireland, for daffodils; Messrs. Dicksons, Lim., Chester, for daffodils; Mrs. Backhouse, Hereford, for seedling daffodils; Messrs. R. H. Bath, Lim., Wisbech, for daffodils; Mr. V. Slade, Taunton, for zonal pelargoniums; Messrs. Hewitt and Co., Solihull, for floral display. Messrs. Simpson and Sons, Birmingham, for daffodils.

National Auricula Society.

MAY 3.

The annual exhibition of the Southern section was held in the Horticultural Hall, Vincent Square, Westminster, on Tuesday last, and, contrary to most expectations, it proved a far greater success than was thought possible. No doubt the past cool days have helped exhibitors materially, with the result that a really good show of these charming flowers were staged.

The premier class was for twenty-four varieties in the show section. Although there were but two exhibitors, both staged well. The first prize going to Mr. James Douglas for a beautiful display. The plants were in splendid health, and the flowers were finished perfectly. The varieties employed were Favourite, Mrs. Henwood, Mrs. Phillips, Smiling Beauty, George Lightbody, Frank, Prince Charming, Loveliness, Eucharis, Olympus, Harrison Weir, Bella Donna, and Sea Mew. Mr. W. M. Shipman, Altrincham, was second with a somewhat weaker display as a whole, though many of the specimens were almost perfect. The most prominent varieties were Harrison Weir, Mikado, Molly, Mrs. Phillips, Mrs. Henwood, Amy Robsart, and Richard Headley.

In the smaller class for twelve plants Mr. James Douglas was still to the fore with a strong exhibit. His varieties were Mrs. Henwood, Lincoln Green, Mikado, Smiling Beauty, William Smith, Harrison Weir, Marmion, George Lightbody, adjudged the premier show auricula, Victor, and Heatherbell. The well-known amateur grower, Mr. W. Smith, Bishops Stortford, was a capital second, having good examples of The Pilot, The Mikado, Stately, George Lightbody, and Majestic, while Messrs. Phillips and Taylor, Bracknell, were third, having nice plants of Acme, Shirley Hibberd, and Abbe Liszt; while Mr. W. M. Shipman was awarded fourth prize. The competition for six plants was somewhat keen, but Mr. W. H. Parton, Birmingham, secured first prize for some good specimens of Mrs. Henwood, Shirley Hibberd, George Rudd, George Lightbody, Mikado, and Favourite. Mr. J. Bennett-Poë, Ashley Place, S.W., was the second prize winner, staging good typical examples of Prince Charming, Harrison Weir, and Mrs. Henwood. Mr. F. W. Price, Beckenham, brought up the rear for third place with neat plants of Olympus, Harrison Weir, and Acme.

For four varieties Mr. F. W. Price led off in a strong class. His varieties were Richard Headley, Shirley Hibberd, Olympus, and Lancashire Hero. Mr. J. Bennett-Poë came second with a nice plant of Mrs. Henwood: while the third prize was relegated to Mr. W. H. Parton.

There were nineteen entrants for a single specimen of a green-edged variety, and the honours fell to Messrs. Phillips and Taylor, who staged Mrs. Henwood. The same firm carried off the third prize with the same variety, while Mr. J. Bennett-Poë was second with still the same variety.

In a similar class for grey-edged varieties the competition was not quite so keen. Mr. James Douglas won first prize with a beautiful specimen of George Lightbody; Mr. W. M. Shipman followed with a weaker plant of the same variety, while Mr. H. R. Taylor, Cheam, was third with Richard Headley. We had seventeen contestants for a single plant of the white-edged varieties, Mr. J. Bennett-Poë coming first with Acme. Mr. W. F. Price was second with the same variety, while Mr. James Douglas was third with Conservative. For a single self variety, Mr James Douglas secured the first prize with a fine specimen of Queen of Spain; Mr. J. Bennett-Poë followed with Mikado, and Mr. W. Smith brought up the rear with the same sort. Mr. W. Smith cleared the deck in the seedling class, taking first, second, and third respectively with his seedlings Viscount, Countess, and Emerald—not a bad record.

Class 10 was for four show varieties, and there were six entries, Mr. J. L. Gibson, Leatherhead, winning well with the Rev. F. D. Horner, Mikado, George Lightbody, and Marmion. Mr. H. R. Taylor won second, and Mr. R. Beer, Bickley, was third.

The alpine classes proved a great source of attraction, and during the afternoon it was difficult to inspect the exhibits. For twenty-four plants Mr. Jas. Douglas was again invincible, leading with a splendid selection. The varieties were Teviotdale, Golden Eye, Phyllis, Chieftain, Claud Halcro, Argus, Olivia, Rosy Morn, Admiration, Mrs. J. Douglas, and Commander Douglas. Messrs. Phillips and Taylor made a good second, their best specimens being Argus, Her Grace, Thetis, W. Smith, Majestic, Sunrise, and Charmer; Mr. W. Shipman was third with smaller plants, though bright, neat flowers.

Four competitors staged in the class for twelve varieties, Mr. Jas. Douglas still leading. His exhibit was a particularly strong one. The varieties were Commander Douglas, Rosy Morn, Argus, Janet, Brighteyes, Phyllis Douglas, Blue Jay, and Claud Halcro. Messrs. Phillips and Taylor were second with good specimens of Thetis, Argus, Mars, and Moonshine; Mr. Chas. Blick, Warren Nurseries, Hayes, was third. In the class for six varieties, distinct, Mr. C. C. Price, Brentwood, secured first with well-developed specimens; Mr. F. W. Price followed with good typical examples; while Mr. R. Staward was third. In the smaller class for four plants, Mr. F. W. Price was an easy winner with Urania, Muriel, Argus, and Teviotdale; the second place was won by Mr. W. H. Parton, for good plants of Majestic and Thetis; while Mr. H. R. Taylor was third. Sixteen competitors entered the field for a single specimen with gold centre, Mr. C. C. Price securing both first and second prizes with Duke of York; Mr. J. Bennett-Poë taking third with the same variety.

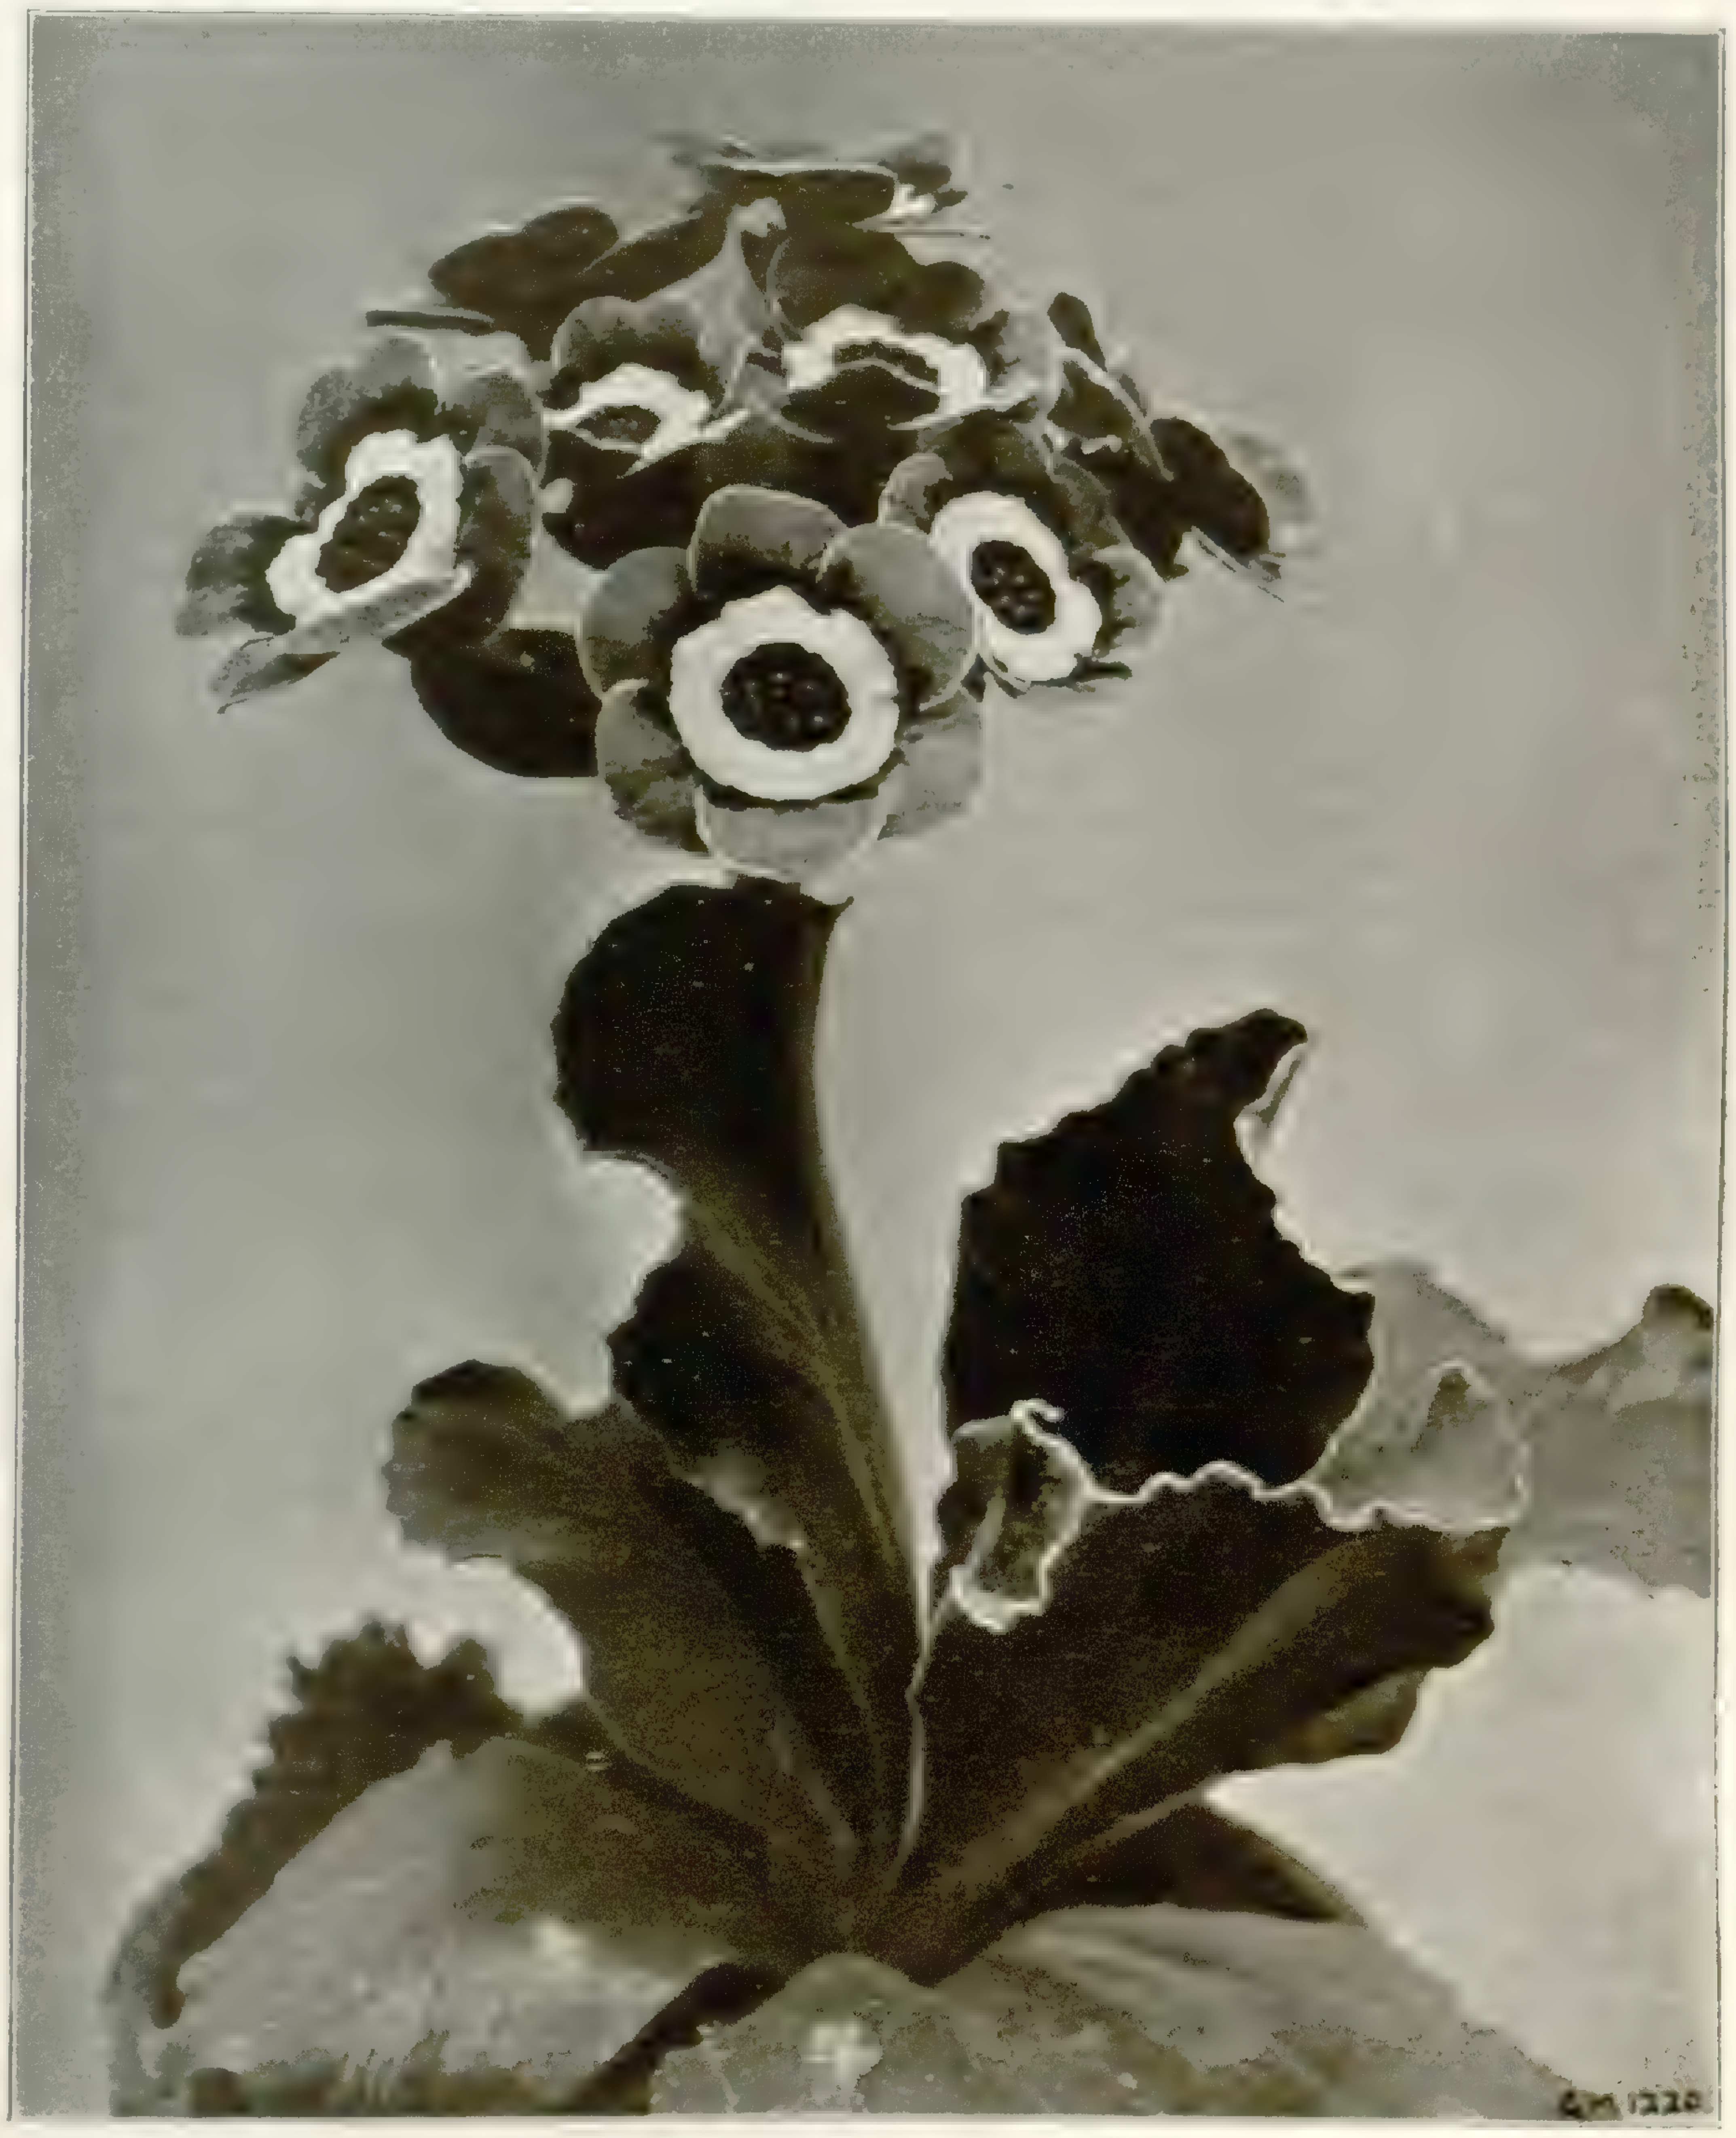
For a white-centred variety, Mr. W. B. Cranfield, Enfield, won well with Thetis; Mr. Charles Turner, Slough, was second with the same variety, and Mr. H. Parton third with Mrs. Parton.

For six alpines, Mr. J. L. Gibson, Leatherhead, won with good specimens of Argus, Urania, Duke of York, Admiration, and Mrs. Markham; Mr. H. R. Taylor was a close second, staging Argus, Teviotdale, and Duke of York in fine form, while Mr. Robert Morton, Woodside Park, made a good third.

Mr. R. Staward was awarded first prize for six alpine seedlings; while Mr. G. Butler, New Cross, was second.

The class for twelve fancy auriculas only brought out one competitor, Mr. James Douglas, who was awarded first prize for a most attractive display. The varieties were Daffodil, Bronze, Lapwing, Goldfinch, Beauty, Sunset, Old Gold, Banshee, Manakin, Trojan, and a beautiful heliotrope seedling.

The polyanthus classes did not produce anything sensational. For twelve plants, distinct, there were but two entries, Mr. S. Mortimer, Farnham, winning premier position with a remarkably fine strain; Mr. R. Staward was second with some well-grown plants. For a single specimen of polyanthus Mr. H. S. Bartleet, Shooter's Hill, came first for a nice white form; Messrs. Storrie and Storrie, Glencarse, was second and third with fine plants.



THE PREMIER SHOW AURICULA (GEORGE LIGHTBODY).

At the Exhibition of the National Auricula Society. Shown by Mr. J. Douglas.

The class for primroses only attracted one competitor, Mr. R. Staward, who had fine plants, and was deservedly awarded first prize. The groups of primroses and polyanthuses are always an attractive feature. On this occasion there were three entries. Messrs. Storrie and Storrie won with some splendid colours, the whole group being artistically arranged. Mr. S. Mortimer was awarded second with a beautiful bank of flowers; while Mr. J. Crook, Camberley, brought up the rear.

The premier specimen in the show varieties was awarded Mr. James Douglas, for George Lightbody, while the premier alpine variety was awarded to Mr. F. W. Price for Muriel.

Royal Horticultural Society.

On May 3 the Royal Horticultural Hall, Westminster, was filled with exhibits, and some considerable portion of the space was occupied by the annual competition held by the National Auricula and Primula Society. In the rest of the hall the displays were crowded, and there was a good deal of second-rate material on view. The rock garden style of exhibiting is now being greatly overdone, and it is only on rare occasions that a display of this kind is more than of very ordinary merit. Orchids were not present in great force, and daffodils were not so plentiful as a fortnight previously. Roses and carnations were good and forced flowering shrubs very bright.

FLORAL COMMITTEE.

Mr. Amos Perry, Enfield, sent the tasteful Anemone Alleni, with pretty rose-pink flowers (A.M.); Corydalis nobilis and the double Anemone bracteata alba plena, among other hardy flowers. Messrs. J. Veitch and Sons, Chelsea, had many good things forward, and among them we specially noted the pendant scarlet Macleana insignis, the white Primula obconica, the red Saxifraga decipiens grandiflora, and the hybrid gerberas in lovely shades of colour; the fringed white Hydrangea hortensia Mdme. Emile Mouillere (A.M.); the yellow Meconopsis integrifolia, and the brilliant Primula Unique.

The Mountain Buttercup (Ranunculus montana), with bright golden flowers, borne freely, was finely shown by Messrs. Gunn and Sons, Olton, who also had the lovely blue Viola cornuta purpurea. Messrs. Sutton and Sons, Reading, have used a creeping cineraria from Teneriffe, and crossed it with their cactus-flowered varieties, the result being a graceful, light, and free-flowering strain, carrying large and shapely flowers in numerous shades of colour, all charming plants for conservatory decoration, and greatly admired on this occasion. Some interesting shrubs were brought by Messrs. Paul and Son, Cheshunt, and these included Cytisus Heufflei, Viburnum dilatatum, the double-flowered Philadelphus Mer de Glace, Abelia floribunda, and the pretty, white-flowered, elegant-leaved Osteomeles anthyllidifolia.

Messrs. Bakers, Lim., Wolverhampton, brought forward a number of fine saxifragas; S. Arkwright, S. A. Lynes, S. R. W. Hosier, S. Bakeri (deep red), S. Lady Deane, large-flowered, tall, and white; and S. H. S. Stokes, form a fine set of these mossy alpines. Messrs. Dobbie and Co., Rothesay, had a lovely lot of fragrant violas, some in sprays, and some in bowls, the latter to show the habit of the plant, as large pieces of flowering growth were displayed; Walter Welsh, deep yellow with brown centre, was an especially beautiful and brilliant variety.

A fine range of colour was seen in Veitch's grandiflora strain of schizanthuses (A.M.); the rosy shades, and those with crimson colouring were very distinct and beautiful. This firm also had blue, white, and rosy hydrangeas, the bright Azalea Hinodegira, Hydrangea Hortensia Mariesi, etc. The bright pink, semi-double marguerite named Pink Perfection was an attraction in the group from Messrs. G. and A. Clark, Lim., Dover. Gentiana acaulis, gloriously blue; the rare and lovely Trillium erythrocarpum, dwarf, with pretty markings in the centre of its white flowers, were a couple of good things shown by Messrs. W. Cutbush and Son, Highgate.

Mrs. Lloyd Edwards, Llangollen, sent a lovely yellow alpine or border auricula named Yellow Beauty, and a rich blue aubrietia named Lloyd Edwards, both beautiful free-flowering plants. Mr. F. H. Chapman, Rye, Sussex, had a small group of his charming new yellow freesias.

Mr. Page, Hampton, had, in addition to the usual cut flowers, a batch of carnation Britannia, in pots, all carrying a rare crop of flowers, and showing in a very effective manner the freedom and usefulness of this scarlet perpetual variety. Messrs. R. and G. Cuthbert, Southgate, had a brilliant display of mollis azaleas and lilacs, wonderfully well arranged.

Messrs. B. R. Cant and Sons, Colchester, contributed rambling roses in pots, and beautiful cut blooms of Claudius and Elizabeth, both roses of large size and fine substance. Messrs. Wm. Paul and Son, Waltham Cross, filled one corner of the hall with a very effective exhibit of roses, and here Tausendschon and Elsie, the latter a double, pink-tinted rambler, were notably good, and Excelsa, a red Dorothy Perkins, was attractive. The Lyon Rose, Cynthia, and Albatross were fine roses, well represented by the Waltham Cross firm.

Other exhibitors of hardy flowers were Messrs. J. Peed and Son, Messrs. Heath and Son, Cheltenham; Burton's Hardy Plant Nurseries, Lim., Christchurch, who had an unfortunate position in the corner of an annexe; Messrs. J. Carter and Co., Holborn; Messrs. G. Jackman and Son, Woking; Mr. G. Reuthe, Keston; Mr. Chas. Turner, Slough; Mr. J. Crook, Camberley, who had some very bright polyanthuses; Messrs. Gilbert and Son, Dyke, scarlet anemones; Mr. H. C. Pulham, Elsenham; Messrs. J. Cheal and Sons, Crawley; Mr. C. Elliott, Stevenage; and Messrs. T. S. Ware, Lim., Feltham, who included a fine batch of Primula rosea grandiflora in their display.

Glorious carnations from Mr. H. Burnett, Guernsey, included grand blooms of popular varieties, and a vase of the brilliant new Mrs. C. F. Raphael (A.M.), a richly scented, large, rosy cerise, or salmon-coloured tree carnation of high merit. The charming little yellow Banksian rose was even more admired than the big blooms and the modern ramblers in the group staged by Messrs. Frank Cant and Co., Braiswick, Colchester. Messrs. G. Mount and Son, Canterbury, exhibited wonderful flowers of Frau Karl Druschki and Caroline Testout roses.

A fine group of well-grown schizanthuses was contributed by Wm. Noakes, Esq., Selsdon Park; these were excellent specimens, and showed a great range of colour and fine culture.

The climbing lygodiums in Messrs. H. B. May and Sons' exhibit were attractive, as also were Osmunda regalis cristata and Nephrolepis exaltata Scholzeli, another of the plumose varieties, but the dwarf Osmunda palustris crispato congesta (A.M.), with rose-tinted young fronds, was especially noteworthy, and should prove very popular.

DAFFODIL COMMITTEE.

Messrs. Barr and Sons, Covent Garden, had an interesting display, but the daffodils were their leading feature. These were admirably set up, and included Lolah, white trumpet; Dresden, Herrick, Socrates, Horace, and other beautiful poeticus varieties; Gloria Mundi, Fire Queen, Glitter, White Slave, White Lady, Will Scarlet, Chas. Surface, Hamlet, and other fine varieties. Some handsome tulips, such as Prince of Austria, Golden Lion of Hillegom, Brilliant Star, and Couleur Ponceau, were shown by Messrs. R. H. Bath, Lim., Wisbech, who also contributed a collection of the newer daffodils, in which Larissa, with a rich flat orange crown, was very fine.

Miss F. W. Currey, Lismore, Ireland, arrived rather late with a few choice daffodils, chiefly small-crowned varieties of high merit. Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), sent several new seedling daffodils, all having Mdme. de Graaff as one parent; Cooksoniae and Chapmani were the best, and the former, a fine white variety of the giant Leedsi section, gained an A.M. Messrs. R. Wallace and Co., Colchester, had some magnificent tulip flowers, but even more lovely were the few flowers of such daffodils as Colleen (A.M.), the poeticus variety Ruskin, Whitewell, and White Sail.

Messrs. Cartwright and Goodwin, Kidderminster, displayed a number of lovely new daffodils, their Rudyard Kipling, Mrs. Betteridge, wholly white triandrus hybrids, Ethelbert, Harold Cartwright, Herod, and King Alfred standing out conspicuously. In Messrs. R. Sydenham's group of daffodils the chief attractions were Peveril, Wave Crest, the fine Homespun, Whitewell, Seville—lovely broad orange cup, Incognita, and White Lady, the small but brilliant Glitter, and Cavalier.

ORCHID COMMITTEE.

A lovely variety of Cattleya Mendeli named Pearl McBean (A.M.), was shown with several spikes of beautiful odontoglossums, and secured its meed of praise for fine form and deep colour. Such rare old orchids as Miltonia flavescens, Cymbidium Lowianum, and the quaint Bifrenaria purpurascens, with seventeen flowers and buds, were shown by Mr. Chas. Turner, Slough. Very fine in form and colour was Odontioda Charlesworthi Theodora (F.C.C.), shown by its raiser De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks; it has brilliant crimson flowers; O. Zena was also well shown by the same exhibitor.

Among the orchids brought up by Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, Odontoglossum crispum Magnum Bonum (A.M.) was especially beautiful, as it had a perfect spike of white, brown-spotted flowers; Cattleya Dusseldorfei Undine Westonbirt variety. (F.C.C.), with four large chaste flowers; and a splendid Cattleya Mendeli with seventeen exquisite flowers.

Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, brought up Brasso-cattleya Veitchi, B.-c. Queen Alexandra, Maxillaria Sanderiana, numerous forms of Cattleya Mendeli, etc., Brasso-cattleya Pink Beauty was well shown by Messrs. James Veitch and Sons, Chelsea. Miltonia Bleuana Hessle var. (A.M.), shown by W. P. Burkinshaw, Esq., West Hill, Hessle, was a lovely thing with a red blotch at the base of the lip. The green and black Cœlogyne pandurata was prominent among the orchids shown by Mr. E. V. Low, Haywards Heath. A good specimen of Cypripedium Rothschildeanum Northaw House var., carrying six spikes and an aggregate of thirty-two flowers and buds, was shown by Mr. E. May, gardener to J. B. Joel, Esq., Northaw House, Childwickbury, St. Albans, and was greatly admired for the good culture it represented.

In a very charming group of orchids set up by Messrs. Charlesworth and Co., Haywards Heath, Trichopilia Backhousiana, Odontoglossum Phœbe, and the somewhat rare Acineta Humboldti were to be seen. In Messrs. Sander and Son's collection of orchids a large plant of Lælio-cattleya Choletiana (one spike carrying eight flowers) was a feature, and Chysis bractescens, Odontioda Cooksoniæ, and Ada aurantiaca were other notable things on view.

FRUIT AND VEGETABLE COMMITTEE.

A large collection of rhubarbs was brought up from Wisley, but there was nothing to indicate that any variety possessed special merit either of size, earliness, or colour. Some remarkably fine Royal Sovereign strawberries and good Lady Downes grapes were staged by Mr. J. C. Sutton, gardener to Earl Stanhope, Chevening Park, Sevenoaks.

Messrs. Sutton and Sons, Reading, made a very fine display of vegetables and salading, and displayed these in a way that attracted general appreciation. Flower of Spring cabbage, Standwell and Golden Ball lettuces, the Sutton rhubarb, Rochford Market and Lord Roberts cucumbers, Early Giant peas, and Early Market tomatoes were all of exceptional excellence.

MEDALS.

Silver-gilt Knightian.—Messrs. Sutton and Sons, Reading, for vegetables.

Silver-gilt Flora. — Messrs. James Veitch and Sons, Chelsea, for greenhouse plants and flowering shrubs.

Silver-gilt Banksian.—Messrs. Barr and Sons, Covent Garden, for daffodils.

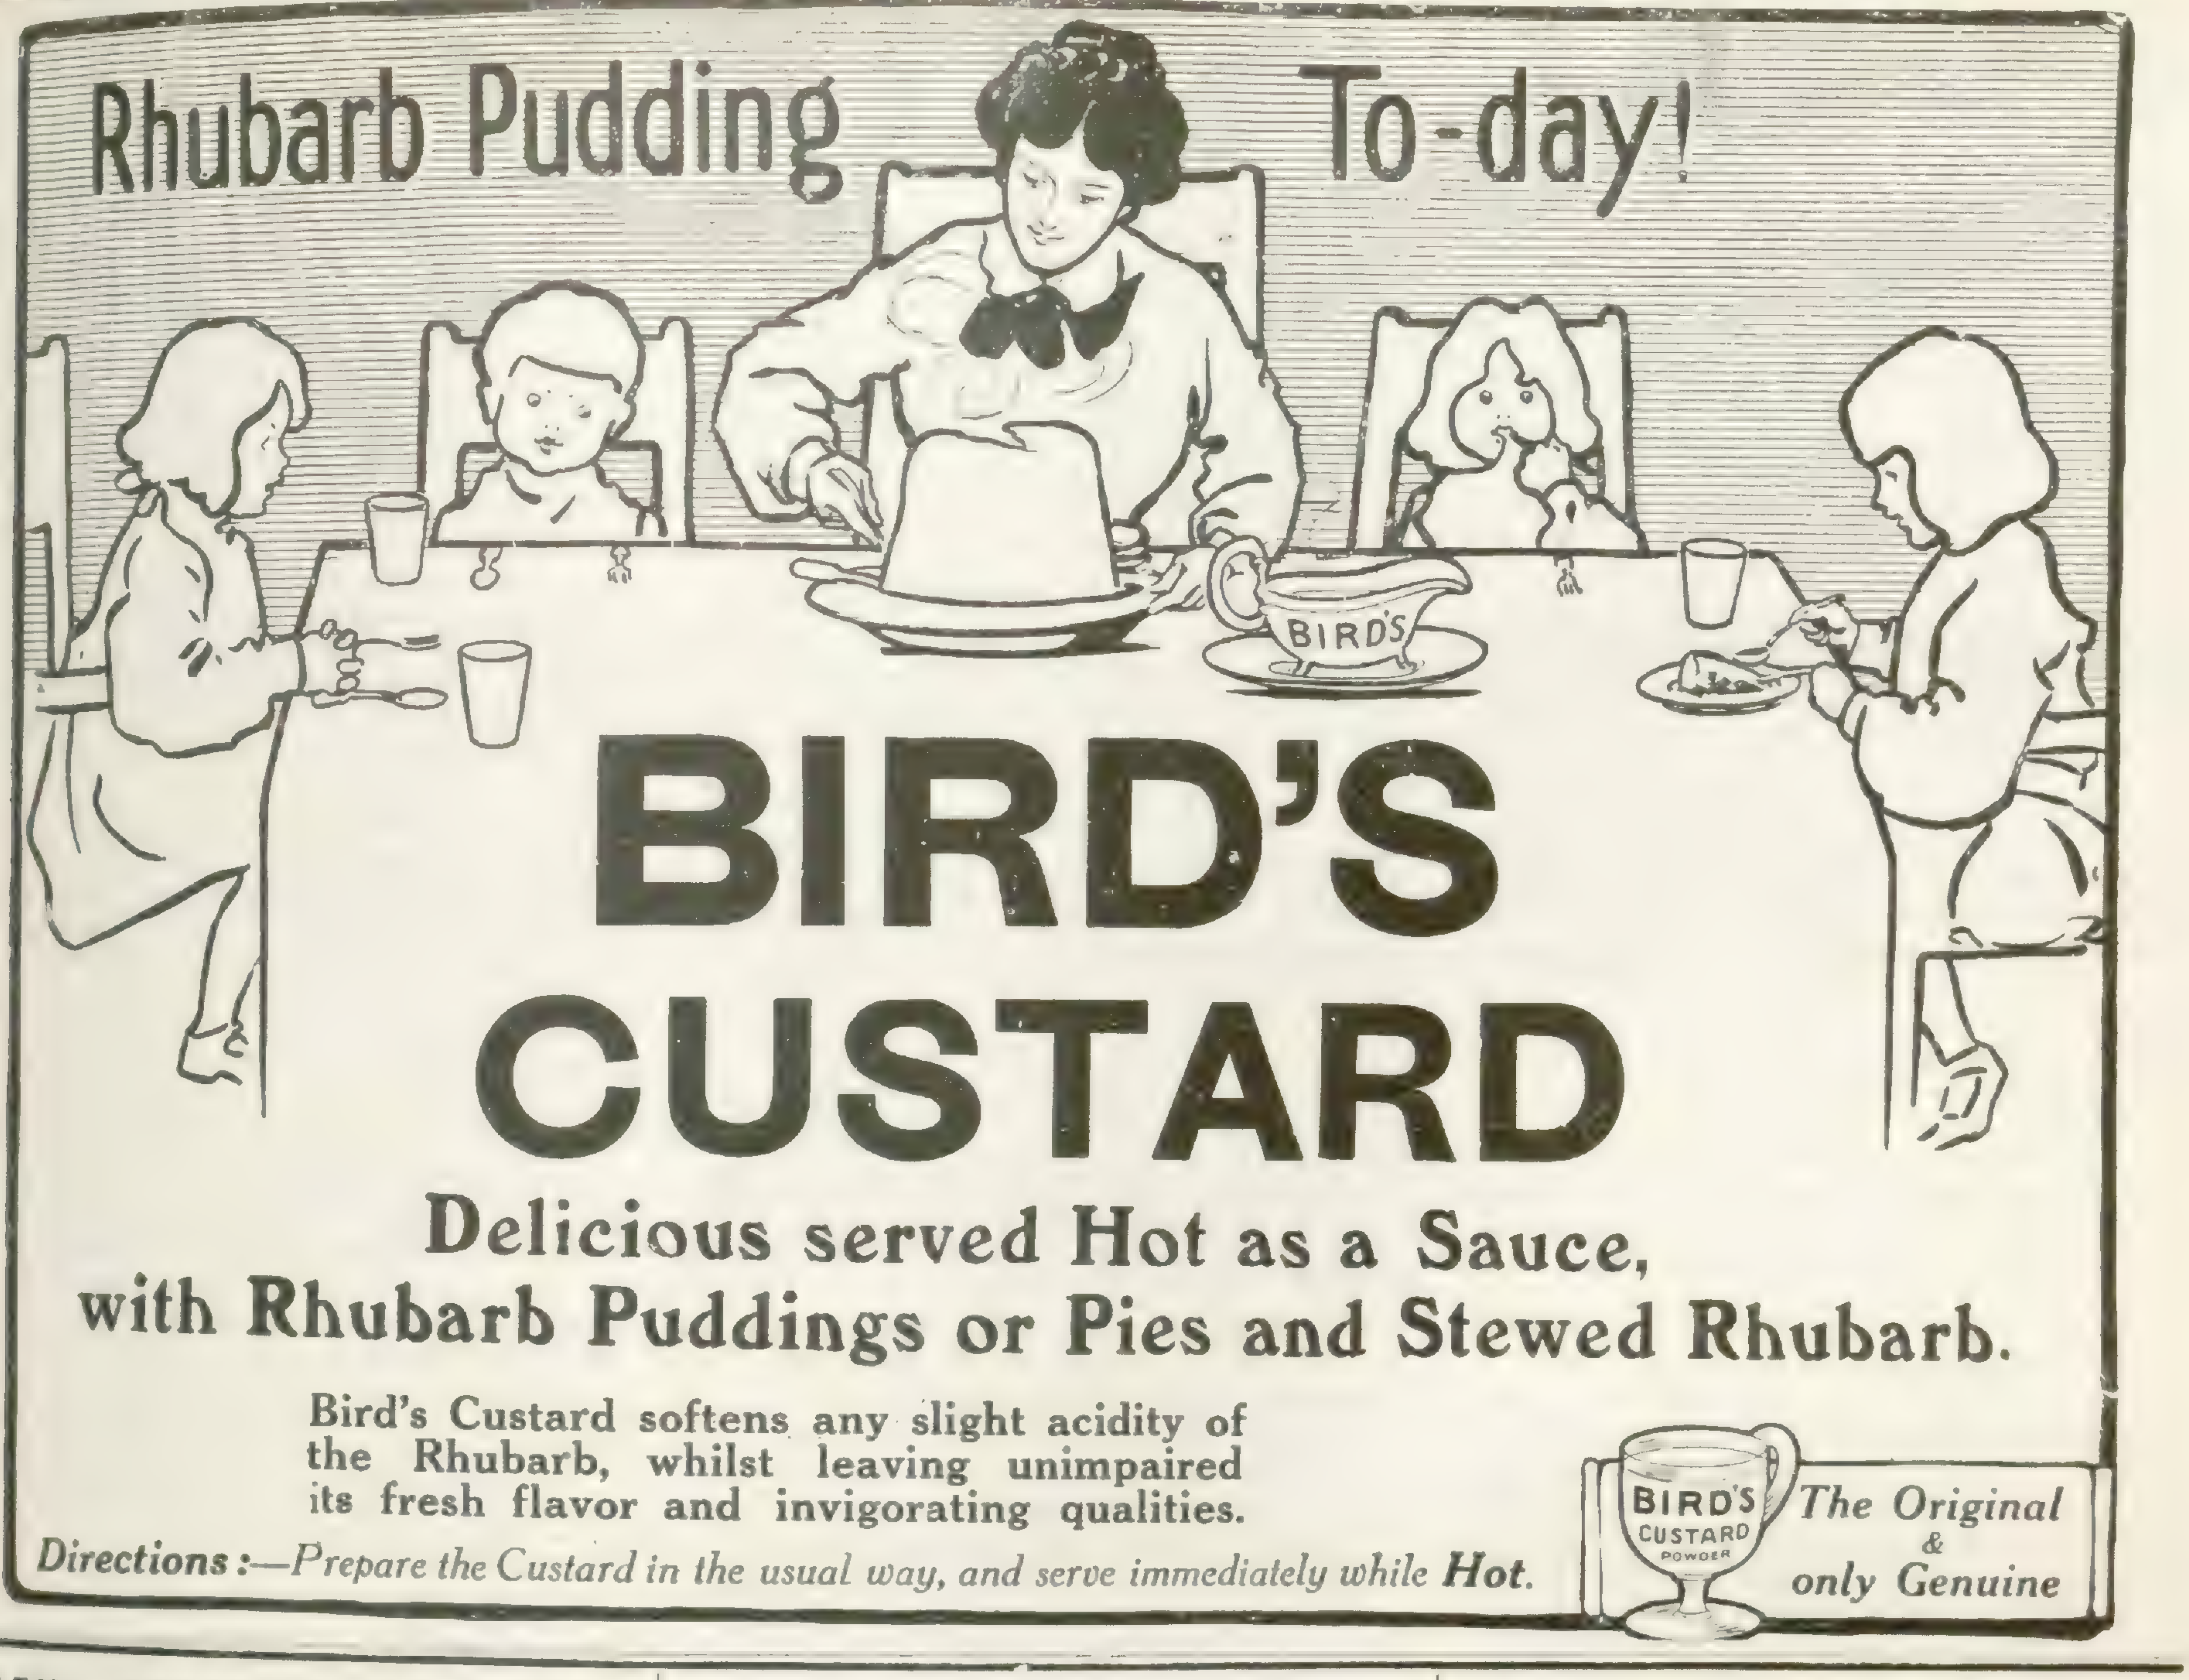
Silver Flora. — Messrs. B. R. Cant and Sons, Colchester, for roses; Messrs. William Paul and Son, Waltham Cross, for roses; Messrs. W. Cutbush and Son, Highgate, for carnations and hardy plants; Mr. Amos Perry, Enfield, for hardy flowers; Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; Messrs. Cartwright and Goodwin, Kidderminster, for daffodils; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. Sander and Sons, St. Albans, for orchids.

Silver Knightian.—Mr. J. Sutton, gardener to Earl Stanhope, Chevening, Sevenoaks, for fruit.

Silver Banksian.—Messrs. R. Sydenham, Lim., Birmingham, for daffodils; Messrs. Bakers, Codsall, for saxifragas; Messrs. R. and G. Cuthbert, Southgate, for flowering shrubs; Burton's Nurseries, Christchurch, for hardy flowers; Messrs. Dobbie and Co., Rothesay, for violas and pansies; Messrs. Garaway and Co., Bristol, for schizanthuses; Messrs. G. Mount and Son, Canterbury, for roses; Mr. H. Burnett, Guernsey, for carnations; Messrs. Low and Co., Enfield, for roses, carnations, etc.; W. Noakes, Esq., Selsdon, for schizanthuses; Messrs. J. Peed and Son, Norwood; and Messrs. H. B. May and Son, Edmonton, for ferns.

CERTIFICATES AND AWARDS.

First-class Certificate. — To Odontioda Charlesworthi Theodora, from De Barri Crawshay, Esq., Rosefield, Sevenoaks; to Cattleya Dusseldorfei Undine Westonbirt



Rhubarb Pudding To-day!

BIRD'S CUSTARD

Delicious served Hot as a Sauce, with Rhubarb Puddings or Pies and Stewed Rhubarb.

Bird's Custard softens any slight acidity of the Rhubarb, whilst leaving unimpaired its fresh flavor and invigorating qualities.

Directions:—Prepare the Custard in the usual way, and serve immediately while **Hot.**

The Original & only Genuine

ALPHA SPRAYING MACHINES.

Patent No. 24637/07.

Hydro-Pneumatic Sprayers for Orchard, Garden, Greenhouse, or Conservatory. Large or Small Plantations. Commercial or Private Growers.

The Simplest and most Perfect Sprayers yet introduced.

No constant pumping; once charged, the machine empties automatically.

The **Alpha Knapsack** awarded **First Diploma** at Spraying Competition against the world at Hayes, Middlesex, Tuesday September 28, 1909.

FULL ILLUSTRATED PRICE LIST UPON RECEIPT OF A POSTCARD.

PRICES FROM **15s. to 75s.**

No. 3. THREE QUART SIZE, **17/6.**

NETTING I DO NOT REQUIRE PAYMENT until you have seen and approved of netting. Others may try to copy me, but my netting is similar to that supplied by us to the Royal Gardens, being extra quality small mesh, will not rot. 50 yds. by 1 yd. 2s., by 2 yds. 4s. Any width or length supplied. Orders over 5s. carr. paid. Commoner netting, 50 sq. yds. for 1s. List and samples free. H. J. GASSON, Net Works, Rye. Est. 126 years.

var., from Lieut.-Colonel Holford, Westonbirt, Tetbury.

Award of Merit.—To Osmunda palustris crispato congesta, from Messrs. H. B. May and Son, Edmonton; to Polyanthus Ladham's Brilliant, from Messrs. Ladhams and Sons, Shirley, Southampton; to Hydrangea Hortensia Mdme. Emile Mouilliere, from M. E. Mouilliere, Vendome; to Macleana insignis, Hydrangea Ornament, and Schizanthus hybrids from Messrs. James Veitch and Sons, Chelsea; to Carnation Mrs. C. F. Raphael, from Mr. H. Burnett, Guernsey; to Auriculas Dorothy Cutts, May, and Canary Bird, from Mr. James Douglas, Great Bookham; to Odontoglossum crispum Magnum Bonum, from Lieut.-Colonel Holford, Westonbirt, Tetbury; to Cattleya Mendeli Pearl McBean, from Messrs. J. and A. McBean, Cooksbridge; and to Miltonia Bleuana Hessle var., from W. P. Burkinshaw, Esq., West Hill, Hessle.

OBITUARY.

MR. R. WILSON KER, V.M.H.

It is with feelings of deepest regret we have to chronicle the death of Mr. R. Wilson Ker, of the Aigburth Nurseries, Liverpool, which took place on Tuesday afternoon last, after a long and painful illness. Mr. R. Wilson Ker was one of the best of men, large-hearted, generous, broad-minded, and the personification of uprightness. He was a clever, enterprising nurseryman, and by his death the horticultural world suffers great loss. During the last year or two Mr. Ker suffered greatly, and for some time past his devoted family knew, as he did, that the end could not be far distant, but notwithstanding this shadow over him, he was courageous and kindly as ever. Mr. Ker was in his seventy-first year, and he leaves behind a family of eight sons and four daughters, two of his sons, Mr. R. B. Ker and Mr. Frank Ker, being in the business in association with their uncle, Mr. A. W. Ker, who has for many years managed the seed and bulb department, while Mr. R. Wilson Ker devoted his attention chiefly to the nursery department. To those now so sadly bereaved we tender our deepest sympathy.

For his many excellent qualities of heart and mind, Mr. Ker will long be remembered by all who knew him, while the crotons and wonderful hippeastrums of pink and rose shades, he raised will keep his horticultural successes before the public. It was in June, 1909, that the Council of the Royal Horticultural Society, recognising Mr. R. Wilson Ker's achievements in practical horticulture, and his devotion to the work of the Gardeners' Royal Benevolent Institution, awarded him the Victoria Medal of Honour in Horticulture, an award of which he was very proud.

Mr. R. Wilson Ker's horticultural education was begun under Mr. Skirving, who was a very enterprising nurseryman, with an establishment known as the Walton Nursery, Liverpool. Here he remained for some time, and then proceeded to the famous Pineapple Nursery, at Maida Vale, London, with the Messrs. Henderson. After a stay here, where new plants and orchids were great features, our late friend returned to join his father at Liverpool in 1860. No member of the horticultural trade has ever enjoyed greater respect and popularity than Mr. R. W. Ker, either at home or abroad. He was one of the first British nurserymen to visit Holland regularly to examine and purchase bulbs, and his integrity was such that a recommendation from him was a passport into any bulb nursery in that country. Mr. Ker had a great and abiding love for horticulture, and, while believing British horticulture to be unsurpassed, he nevertheless strongly believed in the advantages to be derived from visiting other countries, especially on the occasion of the great exhibitions. To all the great horticultural functions on the Continent Mr. R. Wilson Ker was invariably invited as a judge, and at Ghent, Berlin, Hamburg, Paris, Haarlem, St. Petersburg, Antwerp, and Vienna he was to be found on these occasions. He also believed in showing others what his firm was doing, and consequently he exhibited his magnificent hippeastrums across the water on many occasions, and was invariably successful with them in international competitions.

The family history of the Kers is vastly interesting, but we may only mention here that William Ker, who went to China from Kew in 1819 for Sir Joseph Banks, and sent home Lilium longiflorum and Kerria japonica, was uncle of Mr. R. P. Ker, who founded the Aigburth nurseries.

MAJOR C. H. ENTHOVEN.

We have to record the death of Major C. H. Enthoven, Chief Officer of the Parks Department of the London County Council, which occurred on Saturday, April 30, in his forty-fourth year. Major Enthoven, late Royal Engineers, obtained his commission at the age of 19, and reached the rank of major in 1902. In February last he was appointed Chief Officer of the Parks Department of the London County Council, when he resigned his commission. The death of Major Enthoven was referred to at the meeting of the Council on Tuesday, and the Chairman said they had all been impressed with the zeal which he had displayed in the work which was new to him.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Carlisle Horticultural Association. — Third Annual Show, to be held in the New Markets, on August 31 and September 1. Nearly £200 are offered in prizes.

National Chrysanthemum Society. — Early Exhibition on October 5 and 6, and great Autumn Show on November 2, 3, and 4, both at the Crystal Palace.

TRADE NOTE.

We are informed that Messrs. James Smith and Sons, Darley Dale Nurseries, Matlock, have received the Royal Warrant appointing them nurserymen to his Majesty the King. It gives us great pleasure to record this, for our knowledge of the firm, and of the high-class stocks cultivated on their nurseries, enable us to say they are well worthy of the honour they have received.

FORTHCOMING ENGAGEMENTS.

SATURDAY, May 7.—French Horticultural Society of London.
MONDAY, May 9.—United Horticultural Benefit and Provident Society.
WEDNESDAY, May 11.—East Anglian Horticultural Society.
Royal Society of Arts.
THURSDAY, May 12.—Japan-British Exhibition; Opening by the Prince of Wales, 11.30 a.m.
British Gardeners' Association, London Branch; Annual Meeting at "Carr's," Strand, W.C., 8 p.m.
FRIDAY, May 13.—Devon County Show at Exmouth.
TUESDAY, May 17.—Royal Horticultural Society; Fruit, Floral, Orchid, and Tulip Committees meet at 12 o'clock; lecture at 3 p.m. on "The Tulip: Problems and History," by the Rev. Joseph Jacob; Scientific Committee at 4 o'clock.
National Tulip Society's Show, to be held at Royal Horticultural Hall.
THURSDAY, May 19.—Perpetual Flowering Carnation Society, at Royal Horticultural Hall.
Royal Gardeners' Orphan Fund; Annual Festival Dinner at the Hotel Cecil, to be presided over by Sir Jeremiah Colman, Bart.
FRIDAY, May 20.—Special Bulb Show at Haarlem; three days.
TUESDAY, May 24.—Royal Horticultural Society's Great Exhibition at the Inner Temple Gardens; three days.

CATALOGUES RECEIVED.

BENJAMIN R. CANT AND SONS, COLCHESTER.—An illustrated list of roses in pots for immediate planting, and of recently-introduced roses that will be ready for sale in June.

THE CRAVEN NURSERY, CLAPHAM, LANCASTER.—This is a very interesting, descriptive, and illustrated catalogue of hardy flowers, the alpines receiving a large amount of attention.

ANSWERS TO CORRESPONDENTS.

BLEACHED TOMATO LEAF.—E. P. C., Bristol: The small piece of leaf sent is not really sufficient for investigation. The specimen showed no trace of disease, but the lack of substance, and bleaching suggest rather too much heat and moisture have been provided, and that a burst of strong sunshine caught the tender foliage while it was glistening with moisture. Remove the damaged leaves, and maintain a drier atmosphere.

FUCHSIAS.—F. L., Ipswich: Shift the plants into pots a size larger than those they at present occupy, and add a sixth-part of dried sifted cow manure to the compost used. Ten days or so later pinch out the points of growth to further induce a bushy habit.

HERBACEOUS LOBELIAS.—M. E. M., Lyndhurst: There should be no danger in planting herbaceous lobelias of the L. cardinalis group out of doors now in your locality. The plants are almost hardy in the south, but it is always a good plan to lift and pot-up a stock each autumn, and part up or pot them in early spring.

MUDDY WATER IN ARTIFICIAL LAKE.—G. L. C., Bracknell: The muddy water may be due to one or several causes. The supply itself may not be clean; the action of the water supply may be strong enough to disturb the puddled clay bed of the lake, and so make the water dirty; or the water may have become rather stagnant, and therefore muddy. You do not tell us what kind of a water supply you have, or how it enters the lake. If the foregoing suggestions do not lead to the cause of trouble, please send us further particulars that we may be able to help you.

APPLE SUCKER.—E. W. J., Carlisle: The pest is the Apple Sucker (Psylla mali), one of the most destructive of the many pests that attack apple trees. Early in September the females deposit their eggs chiefly on the branches upwards of a year old, and usually in furrows and crevices. Early in April the eggs hatch out, and the young apple suckers, which are wingless, immediately commence their attack upon the buds. They first gnaw the scales of the buds, and proceed to suck the juices of the tree. Where they are numerous they greatly impair by this means the health of the trees. The suckers undergo several stages of development, and are of a yellowish colour at first, and light green on attaining their full development. The best course to take in checkmating this pest is to prune the trees early in the winter and burn the prunings. We do not know how far your apple blossom has advanced, but it is an excellent plan to spray the trees one or two weeks before the blossoms are expanding with a decoction of tobacco, prepared at the rate of 24oz. of tobacco powder to five gallons of water. This is equivalent to 2 parts of tobacco to 100 parts of water.

CALORICULT.—A. H. E., Chichester: We have not seen the Caloricult structures in working order; indeed, they are quite new to this country. On the Continent, we believe, they are used with great advantage for early forcing, and a great point is the amount of produce obtainable from a comparatively small amount of room. You should apply for full particulars from Messrs. W. Duncan Tucker and Son, Lim., 27, Cannon Street, London, E.C. In regard to the other matter we shall be very glad if you will submit photographs for inspection.

DEFINITION OF AN AMATEUR.—W. [illegible], Falmouth: This old question keeps cropping up, and in all sorts of ways. If, as may happen occasionally, you have a few surplus plants of any kind, and sell them to friends, you cannot be regarded as a professional, but if you make a practice of producing more plants than you need, and advertise them, or otherwise make a practice of selling them then you can hardly be allowed to compete as an amateur. In many gardens the surplus plants, flowers, and fruits, are regularly sold by the gardener, but even this practice does not place the employer outside the position of an amateur at many of our most important exhibitions. For instance, some of the finest orchid collections in the country belong to gentlemen who derive their wealth from other than horticultural sources; as their collections increase, and not wishing to increase the glass accommodation in corresponding fashion, they now and again sell their surplus plants at auction, and derive a goodly sum from the sale, but we have never yet heard that such a procedure made them professionals or traders. Unless you make a practice of producing more plants than you require, and of selling the surplus, we do not think you should be disqualified. Of course, we do not know what your own society's definition of an amateur and a professional is; if there is a special definition in the rules you must abide by it; our answer is only on the general question as submitted.

SCALDED PEACHES.—W. C. F., Renfrew: The small fruits sent show evidences of scalding, due to moisture standing upon them during a period of sudden and bright sunshine, while there was practically no ventilation provided. The drops of moisture act as burning glasses under these conditions, and soon scald the tender young fruits. The remedy is obvious.

PEACH LEAVES DROPPING.—H. J. R., Essex: The tree is evidently in bad health, as evidenced by the small size of the leaves and the gumming of the stems. If you carefully examine the border you will probably find it badly drained, and the strong roots down in the wet lower soil. Crop very lightly, and give water with the utmost care. In the autumn lift the tree as soon as the leaves turn yellow, put the border in order, and replant, or introduce a new tree.

FINEST ODONTIODA.—J. E., Leicester: Tastes differ, and therefore considerable allowance must be made for them when expressing an opinion of this kind. In our estimation, the finest odontioda that has yet appeared is O. Bradshawiæ Cookson's var. It gained a first-class certificate from the Royal Horticultural Society on March 9, 1909, and was figured in our columns. It is also described and figured in the "Gardening Year Book for 1910," among the new orchids of the year 1909. This interesting and useful handbook is published at the Gardeners' Magazine office, 148, 149, Aldersgate Street, E.C., 1s. 2d. post free.

BACTERIAL DISEASE IN TOMATOES.—J. H. C., Duffield: The disease is a bacterial one, and is readily recognised by the brown discoloration of the woody part of the stem, this being found to be quite hollow when severed. The disease seems capable of propagation by means of any insects that puncture or eat the leaves and green parts of plants, and it may be present in soil in which infected plants have been grown. The potato, petunia, physalis, and egg-plant are all liable to this disease, hence the great need of extreme cleanliness in cultivation, the prevention of insect attacks, and rotation of crops. For the present all you can do is to vaporise regularly, and remove and burn all plants that show signs of infection.

NAMES OF PLANTS.

DUNELM, Durham.—A variety of Odontoglossum odoratum, and one of no special value. In growth and leafage this species is very much like O. crispum.

A. D., Bovey.—Apparently a rank-growing variety of the Watercress, possibly Nasturtium officinale var. siifolium. We shall be obliged by your sending a specimen when the plant flowers.

B. A., Glastonbury.—1, probably Begonia utiloba; 2 and 3 are plumose Nephrolepises, the first somewhat resembles N. todeaoides, and the second N. Piersoni, but neither are in true character, both fronds showing considerable reversion to the type.

WM. ARTINDALE & SON.

A NEW CHOICE AND RARE HARDY PLANT.

Nierembergia rivularis (White Cup), this variety is quite hardy and the handsomest of all Nierembergias. The stems and foliage trail along the ground, while the [illegible] poised above the foliage are open cup-like flowers of a creamy white, usually nearly 2 inches across. They are faintly tinged with rose and have yellow centres, flowering continuously during the summer and autumn. They have a pleasing effect in the distance and are quite as pretty when closely viewed. Extremely pretty plant.

4in. high, 9d. each; 7/6 doz.

Month of Flowering, July-October.

MONEY RETURNED IF NOT APPROVED.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

King Edward VII.

The recent sudden death of King Edward VII. has produced a profound impression, not only upon the various classes of people that belong to the British Empire, but upon other nationalities throughout the civilised world. Nations other than our own cannot feel in the same degree the sense of loss that is uppermost in the thoughts of those who have enjoyed the advantages of his short but highly beneficent reign; but they know that we have lost a Sovereign who used to the full his commanding influence in maintaining those peaceful relations between his own and other nations which are essential to the welfare of all countries and people. It is a matter of common knowledge that King Edward enjoyed to the full State ceremonial as a symbol of monarchy, and the pageantry associated therewith, but, strong as may have been his love for these, he had no liking for the glitter of the sword and the clash of arms, with their attendant horrors and hindrances to social progress. He therefore deserved, and fully obtained, the love of his subjects, and the gratitude of all who appreciated the blessings of peace. Again, while ever ready to maintain the dignity of his exalted position, and giving the closest attention to State affairs, King Edward entered heartily into the enjoyment of the several aspects of country life, and took an active interest in the various movements that have had for their object the advancement of the arts and sciences and the amelioration of the condition of the poor, and indeed of the industrial classes generally. It is pleasant in this hour of sorrow to call to mind the great zeal that King Edward displayed in the fulfilment of the duties of President of the British Commission of the Paris Exhibition of 1878, and how liberal was his contribution to the success associated with the display of the products of Great Britain and her Colonies and possessions. What was true of the exhibition of 1878 was equally true of that held twelve years later, and it may be mentioned as a matter of some moment that he used his powerful influence to ensure an adequate representation of British horticulture in Paris on both occasions, and especially the first, and with so much success that the commanding position occupied by British horticulture was amply vindicated. Exhibitions of the first importance at home also received his fullest support, and we could have no better proof of this than in the magnificent Colonial and Indian exhibitions that were held in the gardens of the Royal Horticultural Society at South Kensington. As a member of the executive King Edward took an active part in their management, and it was generally conceded that in carrying out the arrangements, his tactful resource, great breadth of view, and stimulating endeavour contributed in no small degree to the splendid success that was achieved. If we turn to another, and certainly a most beneficent aspect of the late King's activities, the foundation, on his initiative, of the great charitable institution now known as King Edward's Hospital Fund, and his presence on the Royal Commission for Housing the Working Classes at once come to mind as evidence of his generous nature and strong sympathy with the sick and suffering and the poor. To recall his successful endeavour in connection with these two great movements is to fill with gratitude the hearts of those—and happily they are many—who recognise the importance of well-equipped hospitals and of healthy homes for the industrial classes. Horticulturists have special cause for remembering with gratitude King Edward's achievements in the cause of charity, for he was a patron of the Gardeners' Royal Benevolent Institution from 1871 till 1890, and, on the death of the Duke of Westminster, who had long been president, he graciously consented to become president, a position he occupied until his accession in the following year, when King George, then Duke of York, consented to fill the office. These are but few of the many movements in which King Edward took a prominent part during the many years of his activities as Prince of Wales, and it should be mentioned that he had a strong sympathy with the efforts made to provide open spaces for town dwellers. That he should have consented to open public parks of large area and laid out at a considerable cost, was not perhaps especially remarkable, but it is a matter of considerable interest that one occupying so exalted a position should have been ever ready to show by his presence his sympathy with small endeavours. Appreciating to the full the importance of recreation grounds and gardens in and near towns, he did not appear to attach so much importance to their size as to their environment, and we have had the pleasure of being present at the opening by him in thickly populated districts of gardens of very modest proportions. It may, perhaps, be said that King Edward was less of a horticulturist than an agriculturist, but there can be no question that, from a very early period in life he fully appreciated the interest and the charms of well-planned and efficiently managed gardens. In proof of this, if proof were wanting, it would suffice to direct attention to the extensive and beautiful gardens at Sandringham which have been wholly constructed since it became a Royal residence. Beautiful as the gardens and grounds have been for a very long period, considerable alterations and improvements have been in progress during the past two years, and it was only within a few days of his lamented death that our late King went to Sandringham for the purpose of observing the progress that was being made and giving such further commands as he considered necessary. The gardens at Windsor and Frogmore, as so well known, have received a full share of attention, and within a comparatively short period of the accession of King Edward, the greater part of the glass structures have been rebuilt in accordance with more advanced ideas, and various other alterations made with a view to improve the usefulness and the interest of these great gardens. Indeed, he taught by example at Frogmore as at Sandringham the same lesson to owners of gardens as he taught landowners and farmers generally, namely, that to obtain the best possible results full advantage must be taken of the most modern appliances and the most improved methods of procedure. In other ways was sympathy shown with horticulture. During the earlier years of the Temple Shows, when help was needed by the Royal Horticultural Society to enable the Council to carry out their new and vigorous policy, King Edward was a frequent visitor, and thereby contributed in no small degree to the popularity which these great gatherings now so deservedly enjoy. Later, when the society had by indomitable perseverance and the generosity of many of its Fellows, provided itself with a hall that was so greatly needed for the proper conduct of its work, King Edward graciously consented to open the building, and those who had the good fortune to be present at the opening ceremony will not readily forget his words of appreciation and encouragement, or the geniality that was shown by him in the proceedings. And now our beloved King has passed from us full of years and honour, but, alas! all too soon. In the hearts and minds of his sorrowing subjects his memory will ever have a warm place, while history will always acclaim him as Edward the Peacemaker.

Water Gardening.—Considered as a generic term, water gardening means the cultivation of plants in and around water. In other words, it is the creation of beautiful scenes by means of pools or streams of water, and plants of various kinds. Water gardening has only been taken up earnestly during the last decade or so, and two things have contributed largely towards its wonderful development; these are the increasing love of hardy plants and an outdoor life, and the introduction of exquisite water lilies by M. Latour Marliac. Nature has always been painting pictures and singing songs of water gardening, but horticulture took very little heed of them. First of all the hardy flower border came by its own again; then the alpine and rock gardens developed in a marvellous manner, followed by a desire to improve the water scenery of the garden by planting beautiful flowers along its margins, and inducing beautiful blossoms to open on its bosom. In many gardens water was at hand, and Nature needed but little assistance, but in other gardens the coming of the nymphaeas brought the desire and need for water in which to grow them. Once the charm of water gardening took hold of the garden-loving public it became a fashion, and nurserymen and hybridists took any amount of pains to discover or create beautiful aquaties and moisture-loving subjects. Others, again, discovered that many well-known plants were often more suitable for positions near water than for the herbaceous border, and so the possibilities of the water garden were gradually opened up until now every garden of any pretensions contains a combination of water and flowers. We have continually drawn attention to the delights of water gardening, and we know that the illustrations of water gardens in Cornwall and Ireland, given in these pages two and three years ago, did a very great deal to advance natural water gardening, while our views of formal lily pools, such as those at Hillingdon Court, Downside, and elsewhere, served as examples that were followed in many parts of the country. In the present issue we give a few more illustrations of beautiful water gardens, as well as several articles dealing with various aspects of water gardening, by writers who have great practical experience in these matters.

Royal Horticultural Society's Meetings.—With reference to the meeting and exhibitions arranged for Tuesday and Thursday next, the Rev. W. Wilks writes: Owing to the lamented death of our late King and Emperor, Edward VII, of happy memory, the fortnightly meeting and exhibition of the Royal Horticultural Society, fixed for May 17, will not be held. The exhibition of the National Tulip Society for the same date is also abandoned, and the Perpetual Flowering Carnation Society's Show, arranged for May 19, at the R.H.S. Hall, is postponed until June 9. The Royal Horticultural Society's Great Spring Show, in the Inner Temple Gardens, Victoria Embankment, will be held as arranged and advertised. The show opens at noon on Tuesday, May 24; a private view for Fellows of the society only is given from 7 a.m. to noon on Wednesday, May 25—open to the public from 12 to 7 p.m.; and on Thursday, May 26, from 9 to 6.

Royal Gardeners' Orphan Fund.—In consequence of the death of King Edward VII. the annual festival dinner of this charity, arranged to be held at the Hotel Cecil on May 19, under the presidency of Sir Jeremiah Colman, Bart., has been postponed. Due notice of the altered date will be given at the earliest possible moment.

The Florists' Loss.—There is no doubt whatever that the death of King Edward will mean a great loss to London florists, especially those in the West-End, who look to do their chief business during May and June, when the society season is at its height. Now, unless there is a considerable departure from the usual rules governing national mourning, the loss to florists and to growers of flowers and plants for house and hotel decorations will suffer terribly.

The Weather.—British weather always provides material for a paragraph, but during the past week it has gone out of its way in the demand for attention. On Saturday last London was visited by thunder, lightning, snow, hail, and rain. Saturday night and Sunday morning were bitterly cold throughout the home counties, and early on Saturday morning seven degrees of frost were registered in many parts of the Thames Valley, followed by five degrees early on Tuesday morning. It is not possible to state at the time of writing how much damage has been done to fruit crops; fortunately pears and plums had already set fairly well, and their advancing leaves afforded some protection to the tiny fruits, but in many instances the early apples were in the first flush of their floral beauty, and a few more days will show what effect these cold snaps have produced. Flowering trees and shrubs have suffered, especially where exposed to the cold north and north-west winds prevailing, their floral beauty having been greatly diminished.

Garden Pictures do not form a very strong feature at the Royal Academy this year, for they are less numerous than usual, and include but few works of outstanding merit. The number is certainly less than one might reasonably expect, seeing that the great changes which have been effected in gardens within recent years have greatly enhanced their charms from the artistic standpoint. The creation of water gardens, the extension of the cultivation of climbing and rambling roses, and the development of hardy flower borders have provided much additional material for brush and pencil, and it is surprising so few artists of position should take advantage of it. There are a few fine pictures of gardens, and a considerable number of small paintings that are well executed and very pretty, but they cannot be said to adequately represent the artistic aspect of the garden at the present day. The most important of the works that have obtained their inspiration from the garden is Mr. Alfred Parson's "Fruit and Flowers," in which heavily laden picturesque pear trees and hardy border flowers, growing on the outskirts of a walled-in garden are admirably treated. To the right of the walk is a glorious border of hardy flowers, in which richly-coloured phloxes, and heleniums, stately single hollyhocks, and the bold-growing Senecio clivorum, with a host of other subjects that are in perfection in the later days of summer, are yielding liberally of their floral wealth. The composition, it need hardly be said, is remarkably good, and each plant is depicted with sufficient detail to admit of its being readily recognised. On the other side of the walk that skirts the border are several tall pear trees, carrying an abundance of ruddy fruits. "February Flowers," by the same artist, is a pleasing work, but does not make such strong claims for consideration as does the work first mentioned. "Monacute," by Mr. E. A. Rowe, is a charming garden scene, in which the wild clematis has been used with good effect in clothing the pillars of red brick that support the gates by which an entrance to the garden is obtained. Miss Mima Nixon's "Rose Garden, Middachten," must have somewhat heavily taxed the artist, for a geometric garden filled with dwarf roses does not readily lend itself to artistic treatment, but whatever difficulties there may have been they were surmounted. "In a London Garden," by Sir E. J. Poynter, has also roses for its subject, but, instead of beds of dwarfs a number of standards are grouped round a pretty summer-house, and produce a pleasing effect. In this connection it may be mentioned that there is on the walls a remarkably good portrait of Mr. William Kelway, who has done so much to increase the interest and beauty of gardens.

Wreath from the London Parks.—At its meeting, held on Tuesday, the London County Council resolved to send a wreath composed of flowers and foliage from the Council's parks for the funeral of King Edward, in token of the Council's profound grief at the loss of one who had always at heart the interests of London.

April in the North.—April, writes our Aberdeen correspondent, is in these northern regions often a month of the most varied character, showers of rain, hail, sleet, or even snow, alternating with days of the most brilliant sunshine. The one just closed afforded many examples of this. The rainfall for April this year slightly exceeded the average of that month for the last forty years, coming out at just a trifle over two inches. The largest amount recorded here was four and a-half inches in 1871, and the smallest about half an inch in 1891. The temperature during April this year has been almost constantly low, the air being cold, even when the sun shone out. March, in fact, was a better month. Frosty nights have been frequent, and, in the more inland and upland parts of the country there has been much snow. The average mean temperature of April, as deduced from observations of the thermometer in Aberdeen, is just about 44 deg. It is a month, too, when the chill easterly and north-westerly winds render the time very trying for invalids. During April the weather is often worse towards the end of the month than it is at the beginning. Thus, last year, the only snow we had was on the 30th of the month. The swallows generally begin to resume their visitation in the end of the month, and during the last week a few have been with us. As regards the land, April has, on the whole, been favourable for dealing with it, as the soil has seldom been too wet, hence the work of the husbandman is well forward. There has been very little growth, however, for the temperature has been too low, and frosty nights too frequent.

Bluebells at Kew.—At the time of writing a delicate flush of blue, a faint suggestion of the glories to come, extends over the bluebell strewn acres of the Queen's Cottage grounds, and other parts of the Royal Gardens, Kew. During the coming week the bluebells will be a lovely sight and worth going a long way to see.

Rainfall at Leonardslee. Mr. W. A. Cook informs us that the rainfall at Leonardslee, Horsham, during April, 1910, was 11.38 inches. Rain fell on eighteen days, and there was frost on ten nights. The lowest temperature was 25 deg. on April 3; the highest in the shade 64 deg. on April 22; and the highest sun temperature 115 deg. on April 29. The temperature in the sun rose above 100 deg. on ten occasions. In April, 1909, the total rainfall was 7.07 inches, and rain fell on fifteen days, while there was frost on nine nights; the temperature in the sun rose above 100 deg. on twenty-five occasions, and once rose to 70 deg. in the shade.

British Gardeners' Association.—The report of the Council of the B.G.A. for 1909-10, to be presented at the annual meeting at Carr's Restaurant, Strand, on May 25, is now issued. It appears that 274 new members have been elected during the year, and new branches were formed at Carlisle, Penrith, Leicester, and Caterham. Several legal cases have been dealt with satisfactorily by the association, and considerable attention has been given to the work of public bodies so far as this affects horticulture. The council nominates Mr. J. Weathers as general secretary, and Mr. C. P. Raffill as treasurer, and doubtless both these gentlemen will be re-elected. In accordance with rule certain members of council retire, and are not again eligible for election until 1911. Duly nominated members for the vacant seats are Messrs. C. Foster, A. G. Barnes, J. Collier, Thomas Winter, Thomas Bevan, James Lawson, George Figgis, E. F. Hawes, and W. H. Divers. The financial statement shows a balance of £290 14s. 1d. on the right side, as compared with a balance of £257 16s. 6d. brought forward from the previous year.

Recent Additions to the Kew Library.—In the form of an Appendix to the "Kew Bulletin," there has now been published a catalogue of the library additions received at Kew during 1909. This appendix extends to no fewer than 56 pages. A large number of the books added to the splendid national collection at Kew have been presented by the authors, others have been given by friends of the establishment, and the remainder, a considerable number, have been acquired by purchase.

The National Dahlia Society has just issued its schedule for 1910, together with the annual report for 1909, in which the history of the incorporation of the London Dahlia Union with the society is once more told. We have already pointed out that the first exhibition will be held at the Crystal Palace on September 8 and 9, and the second at the Royal Botanic Gardens, on September 20 and 21. With the schedule we have received a report of the proceedings of the Dahlia Conference held in London on March 4 last. The papers by Mr. G. Gordon, V.M.H., on "Dahlias for Garden Decoration"; Mr. James Stredwick, on "Growing Dahlias for Exhibition"; and Mr. J. B. Riding, on "Methods of Exhibiting Dahlias," are published in full. Bound up with this report is a list of dahlias introduced since the publication of the official catalogue in 1904, together with revised selections of varieties for special purposes. For the first time there are official lists of garden cactus, giant decorative, collarette, and pæony-flowered dahlias; from this it will be gathered that the society is now giving attention to other dahlias than those of the exhibition cactus and show varieties. We gather, too, that the society will hold a trial of single dahlias during the present year, in conjunction with Messrs. J. Cheal and Sons, Crawley.

Our Illustrations of Water Gardens.—The illustrations of lakes with water lilies at Easton Lodge and Gunnersbury House are from photographs by Mr. H. N. King, and those of the lily pools at Sandhurst Lodge and the bog garden at Dibden are from photographs by Mr. F. Mason Good.

Polyanthuses from Nuneaton.—From Mr. David Norris, the able gardener at Lindley Lodge, Nuneaton, comes a box of polyanthuses that represent an exceptionally fine strain, and make a brave display of colour upon our table, and fill the room with their delightful fragrance. In sending the flowers, Mr. Norris states that his object in doing so is to give us an opportunity of seeing how well the polyanthuses succeed with him, and of forming an opinion of their effectiveness when grown under the conditions favourable to their full development. Mr. Norris further states that he grows a large number every year, and that they are much admired by all who see them when in bloom. We are not surprised that they should be admired, for the flowers are of remarkably high quality, large in size, and produced in splendidly developed trusses, the latter containing from twenty to thirty fully-expanded flowers. The colours range from pure white to rich yellow and brilliant crimson. Some rose-purple shades are very attractive, as also are the laced flowers. A practice that gives such splendid results deserves to be widely known, and we should be much obliged by Mr. Norris sending us a few particulars of his method of procedure.

LEOPARD'S BANES.

Spring flowers are desirable in every garden, and those who like their homes to be brightened all the year round by the denizens of the garden cannot well be without the doronicums, or leopard's banes, so called because in olden times they were said to keep these beasts of prey away from the home of the cultivator. Nowadays, however, we prize them for their golden flowers, and for the air of gaiety and brightness they yield to the garden in their season.

Doronicum caucasicum.

The Caucasian leopard's bane is one of the most appreciated of all, as it is even more refined than D. austriacum, and is pretty, not only in its flowers, but also in its toothed foliage. It grows from six to eighteen inches high, according to the soil, and is among the early flowers of spring, giving plenty of its good yellow narrow-petalled flowers on stems which are long enough to make the flowers valued for cutting, as well as decorative in the garden. It is thoroughly hardy, and can be grown in practically any soil, while it does not despise shade, although doing best and flowering earlier in sun.

Doronicum austriacum.

The Austrian leopard's bane resembles considerably the Caucasian one, but is, on the whole, a little coarser, although one hesitates to make this remark regarding a flower which is devoid of real coarseness. It grows a little taller, and has less beautiful leaves, but is, withal, a plant to be grown by the many, while its very early spring flowering is a recommendation of some consequence. It thrives in the same positions as the preceding, and is equally easy to cultivate.

Doronicum Columnæ.

This is a near ally of one of the foregoing, and is probably only a variety of D. caucasicum. It was introduced from an Austrian botanic garden as dwarfer than either of the preceding, but, in the writer's experience and he had plants from the original stock in this country—in his garden, it gradually grew taller until it could hardly be distinguished from the taller one. It is worth procuring, however, by those not already possessed of D. caucasicum, and who may have an opportunity of obtaining Columna's leopard's bane.

Doronicum Pardalianches.

An old and well-known native plant in some neighbourhoods, this leopard's bane is not well introduced into other localities, and those who are possessed of a large garden, or who attempt wild gardening, might well consider its claim to a place in the domain. It is a tall-growing species, about three feet or more high, and having large yellow flowers in summer. It likes a strong and good soil, where its large and fine leaves and flowers will attain their full dimensions.

Doronicum plantagineum excelsum.

The tall plantain-leaved leopard's bane is, perhaps, the most valuable of all, inasmuch as it not only flowers in spring but also in autumn, and in some gardens, if the flowers are frequently cut, almost the summer through. Its height is, in some ways, a defect, but it is in other respects a gain, inasmuch as it cannot be used near the front of the border, but is well suited for a middle place. In poor and sandy soil this doronicum is not much of a success, but in rich borders, and in wild gardens, where the earth is good, it will delight everyone with its freedom and the quantity of golden flowers it will produce.

Cultivation.

These doronicums require but little special attention. All of them will grow and flower in partial, and even entire, shade, provided that they are not under the drip of trees, where, although they will grow and flower, they do not look happy. They like, however, some sun, and the early-flowering species, in particular, come much earlier when in a sunny place. They are not particular as to the nature of the soil, but like one which is fairly rich; and in a poor and dry one, especially in districts where the rainfall is slight, they will not give satisfaction to the same degree as when on a rich soil. They should be occasionally divided, lifting and replanting when they have passed out of flower, and in replanting using the outer parts of the clumps, which will supply more vigorous plants.

Propagation.

This is effected by division, which is best performed immediately after the plants have flowered, choosing, preferably, showery weather, and dividing the plants carefully, preserving for use the best of the outer growths. Each crown will form a plant if desired. Seeds can also be obtained from some seedsmen, and should be sown in the open in April, May, or June, sowing in little drills about a quarter of an inch deep, and covering slightly with fine sandy soil. When the seedlings have made a pair of their true leaves they should be thinned out, pricking off those removed about two inches apart, and transplanting in autumn to where they are to bloom. Seeds may be sown earlier in pots or boxes for making stronger plants, and they may be put in from February to April, sowing the seeds very thinly, covering slightly with fine soil, and, after watering, keeping the pots or boxes shaded until the seedlings appear, when they ought to be given both air and light, but the sun should not be allowed directly on the young seedlings. As soon as they have made a pair of their rough leaves they can be pricked out as recommended for seedlings in the open, gradually hardened off, and then planted in the border. Seedlings of spring will flower the following season.

S. Arnott.

"SHOWING NOT ALLOWED."

The above words appeared in an advertisement for a gardener which recently came before my notice, and they remind one that this is a condition under which a fair number of gardeners are engaged nowadays. "I'm not allowed to show," is an expression frequently heard, and the question that naturally suggests itself is, Why not? Gardeners, as a whole, have a liking for competition; it puts a bit of spirit into the thing, so to speak, and, apart from the possibility of a little prize money, which helps to eke out the gardener's income, that is none too big in most cases, there is the honour of winning, which always appeals to a man of ambition.

Why is it, then, that so many employers object to exhibiting? Perhaps, if you asked some they would not be able to give a reason other than prejudice, and others might urge that they have no wish to advertise themselves or their establishments in this way, but we know there are places where the gardeners used to exhibit, and their successors are not allowed to do so. Why this change?

Have gardeners themselves been responsible for the cessation of exhibiting? I am afraid it must be admitted that there are cases in which this is so, and more than one man has allowed his ambition in this direction to carry him too far, and the fact is very much to be regretted. If you get behind the scenes in some of the places where showing has been stopped you will learn that the gardener who was given an inch took an ell, and in his desire for honour in the show tent or his anxiety to win prize money, he centred his whole attention on the things he grew for exhibition and neglected his duty in other ways until at last his employer got tired of the whole thing and stopped his exhibiting altogether. It is no good trying to hoodwink the facts as stated above, and where showing has been stopped on account of the avarice of the gardener, I fail to see that the latter has any claim to sympathy. It is one of the things in which tact and moderation should be brought to bear, as it is often abuse of privileges which lead to their discontinuation. I am writing in this strain as a gardener, and I am quite sure that if I were fortunate enough to be an employer I should object to exhibiting if the rest of the garden suffered as a consequence of it.

But what shall be said of those employers who have no such reasons for objecting to exhibiting, and yet do object all the same, perhaps on the strength of what might happen, or from what they have heard has taken place elsewhere. One can have little sympathy with a person who objects to exhibiting because he does not want his gardener to get a little credit for himself and put a few shillings in his pocket, and one does not like to think that such a feeling exists, though there are instances in which appearances certainly point in this direction.

Let us put it in another way. Supposing, for the sake of argument that every employer in the country objected to exhibiting, what whould become of the shows and horticultural societies in general? There could only be one end: they would cease to exist. Perhaps it would not make much difference to such shows as the Temple and Holland House, which are confined almost entirely to the trade, and it must be remembered that the nurserymen who strive to exhibit their very best on these occasions are prompted to do so by the spirit of business. This spirit does not come in where the private gardener is concerned, but what would become of the Sweet Pea Society, the Rose Society, the Dahlia Society, the Chrysanthemum Society, the newly-formed Vegetable Society, and the rest of them, if employers as a whole followed the lead of those who object to exhibiting? Again, there are horticultural societies all over the country, some large and influential, and others small, where the competition is largely maintained by private gardeners, and what would be the fate of these if exhibiting from private establishments were stopped?

Happily, there is no likelihood of such a calamity happening; but would it be out of place to remind the owners of garden establishments who unreasonably object to showing that they owe a certain duty in this matter to the public? It is only when they visit flower shows that thousands of people are able to feast their eyes on beautiful flowers and see the results of the gardener's art, and I therefore say that it is the duty of people who have these things to share, to some extent, the privileges they enjoy with their less fortunate fellows. They can do this by merely allowing produce from their gardens to be exhibited, for they thus give opportunities for other people to see and enjoy them.

Let me state a case. Last year, at the ancient city of Gloucester, in connection with the Royal Agricultural Society's great annual event, there was the finest flower show ever seen in the West of England. Hundreds of people saw it, and opened their eyes in wonder and amazement, for their idea of a flower show was the exhibition they had seen in their own village, and it had never occurred to them that a show would be anything different. It was an education such as West Country folk had never had before, and the memory of it lives, and will always live in the minds of hundreds of simple folk who had never seen the like before, and probably never will again. More than once since I have heard ardent cottage garden sweet pea growers discuss "them there flowers as were showed at the Royal," and village vegetable champions who considered themselves to be perfect in this cult went back from "the Royal" wiser, if not sadder men, for they realised that they had a good deal more to learn.

It is true that many of the exhibits were staged by nursery firms, but many also came from private gardens, and if Lieut.-Colonel Holford, for instance, had objected to exhibiting, visitors to the show would not have seen the magnificent Westonbirt orchids, and would have missed a treat which everybody enjoyed.

Again, what a part shows have played in the development of flowers. Should we have had the roses, chrysanthemums, carnations, dahlias, and sweet peas which enrich our gardens to-day, if there had been no exhibitions at which raisers and growers could display the results of their skill as hybridists and cultivators? I say emphatically, no! and when we think of the beautiful productions exhibited by gardeners with the full permission of their employers, even the man in the street has reason to be thankful that there are a good many owners of private gardens who do not object to exhibiting. Would men like Messrs. Beckett, Gibson, and others have brought vegetable culture to such a pitch of perfection if they had not been privileged to show? and would the world have ever seen such fruit as is staged every year, say, at Shrewsbury by Mr. Goodacre and other doughty champions if they had been denied the privilege of exhibiting? I say no again, and thus it is that the world of horticulture owes much to the proprietors of gardens who support flower shows.

Perhaps the ideal of exhibiting comes in when the interest is of a dual character shared in the same spirit by the owner on the one hand and the gardener on the other; where both have the same object in producing the best, and the pleasure of winning in a keen competition is as great to the master as the man. It is a good sight at a big show to see a gardener when the awards are put up rush away to the telegraph office to notify his employer of his success, because in such cases one may fairly conclude that the interest is of a mutual and real character.

Everybody has, of course, a right to do as he likes with his own, and there are employers, no doubt, who have felt themselves compelled by certain circumstances to discontinue exhibiting, but it is not right to condemn a community because a few of its members have erred, and it would be an unfortunate thing for the horticulture of this country if the rule "No showing allowed" were enforced in private establishments as a whole.

H.

BUSH PEACH TREES.

The notes by your correspondent, "G. B.," page 324, recall to memory bush peach trees that were growing about forty years ago under the charge of Mr. Mill, at Rendlesham Hall, Woodbridge. At that distant period they were fairly old trees, yearly carrying good crops of fruit, and occupying, with the exception of the back wall, which was covered by fan-trained trees, a large lean-to house. They were planted, and established by the late Mr. Allan, father to the well-known chief of Gunton Park Gardens, who, if I have been rightly informed, previous to taking charge of Lord Rendlesham's gardens—a charge he held for many years, and until his death—gained a considerable amount of horticultural experience of a varied description in Italy, but whether or not he adopted this mode of peach culture from what he had seen on the Continent, I am not in a position to say.

Most of the readers of the Gardeners' Magazine are aware of how splendidly peaches, both under glass and upon outdoor walls, are grown at Eastnor Castle, and numbers of them have probably seen there a house occupied by standard peach trees. I well recollect being conducted over the gardens by the late Mr. Coleman, at a time when these trees were carrying full crops of good fruit, and also recollect that he spoke of their usefulness. I question, however, if Mr. Coleman preferred this description of tree to fan-trained ones placed upon trellises in a suitably-constructed house, and, without doubt, he grew his exhibition fruit upon trees of the latter kind. Judging from what I saw at Eastnor, and the experience gained in assisting in the management of the Rendlesham trees, I am satisfied that heavy crops of good fruit can be produced by bush and standard trees planted in borders, but question if crops of such uniform high quality as are usually grown upon fan-trained trees, placed near the glass, can be obtained from them. Your correspondent evidently made excellent use of the kind of house he had to deal with but he does not allude to the quality of the fruit, unless this was done in the leading sentence of his notes, when referring to the trees as "most satisfactory in every way."

The Hendre Gardens. T. Coomber.

Agricultural Education in South Africa.—The proposal to establish a National College of Agriculture at Pretoria has met with great success General Botha intends to set aside £100,000 as a first instalment towards the cost, and the Town Council of Pretoria has agreed to present the Government with a site for the college, at Groenkloof, consisting of 3,681 acres of arable, pasture, and forest land.

WATER LILIES.

Spring, with its bursting buds, refreshing sunshine, and prodigality of blossom, brings a plenitude of work in her train.

Multitudinous tasks are at this season heaped upon the garden worker. Flora's subjects call for care and attention on every hand, and among the many voices one hears is the persistent appeal of the water garden.

At the time of writing we are rapidly nearing the awakening of the water garden into full life and beauty. Calthas, in all their golden gaiety, have, conjointly with the starry snowflakes of ranunculus, ushered in the reign of beauty. Early primulas are astir with life, astilbes are lifting their ruddy bronze growths upward, irises and hemerocallis are putting vigour into new green growths, and a host of other subjects are keenly awake to the [illegible] of summer days, and bright [illegible], and amid all the wealth of water garden plants the queen of them all calls for immediate notice.

These nymphaeas, the floating glory of many a pond and lake, deserve a fuller tribute than I can pen. May is the month par excellence for planting, and with the ever-increasing hybrid varieties, one has indeed a glorious collection to select from. The comparative ease with which the majority of hardy water lilies can be managed, renders them a great asset in the hands of the garden maker. The [illegible] rich-toned leafage, a harmony of deep greens, bronzes, purples, etc., together with the charming range of form and colourings of the flowers, at once gives a special note to all water scenery.

There is an enthralling charm in these nymphs of the pools, with their starry forms uprising from their own "floating bed" of foliage. Pink and rose, ruby and scarlet, orange and pale yellow, cream and white, thus the colours run, with many an intermediate shading, and what is so striking in many forms, the golden anthered centre, amid the shell-like petals, enhances their delicacy or brilliancy.

The water gardener's debt to Mons. Latour Marliac is beyond computation, and the splendid varieties raised by the French florist will stand for generations as a memorial to his excellent work. The old saying, "By their fruits ye shall know them," needs but altering to, "By his flowers we shall know him," and assuredly all who are interested in water lilies will revere the name of Marliac.

Before referring to some of these varieties I will briefly consider the question of planting. Water lilies are not difficult of culture, though in some cases difficulties arrive through various faults of the planters. I have known nymphaeas of the less robust growing forms, including N. Ellisiana, planted in thick earthenware pans (watertight, as far as the bottoms and sides were concerned), and sunk into shallow pools. Surprise was evinced when the lilies did not grow, but the reader will understand that to plant nymphaeas in such a receptacle was really courting failure, for the whole contents of the pans were soon a mass of foul black mud. Where water can be run off from the pools, I am in favour of planting on the pool base, using fibrous turfy loam, with a little sharp sand, and decayed cow manure. Failing this, there is nothing quite like planting in open baskets, which can readily be sunk in the pools, and at the same time, allow the nymphaea roots free egress to the bed of the pool. In this case, providing suitable varieties are chosen, and the water is of sufficient depth, and partially sun-warmed, no great trouble should be experienced in getting young plants established.

Casual planting is often successful, but it is well to exercise both care and discretion in the task. Work well done goes far toward ensuring success.

And now to the varieties. Among white flowers the best are N. Gladstoniana, exceptionally vigorous, and free in growth, white as driven snow, and of large size. N. Marliacea albida, a very fine robust form. N. odorata maxima, the finest of the white forms of N. odorata, and N. Caroliniana nivea, a splendid floriferous gem, with a very fragrant perfume. In addition, there are N. odorata pumila, N. pygmæa alba, and N. odorata alba, which are valuable for small pools.

Of the pink and rose shades one may especially note N. colossea, a giant variety, with massive foliage and grand blooms, opening with a shade of cherry-pink, and gradually softening to white: it is of pleasing appearance, and its freedom and long season of blossom is also remarkable. N. Marliacea carnea and N. Marliacea rosea are both worthy of note, the former a pleasing flesh-pink, and the latter an exquisite soft rose, deepening at the interior of the blossom; both are superb growers. N. suavissima is very good, with massive rose-coloured flowers, pleasing and fragrant. N. caroliniana perfecta, exquisitely perfumed, grips the attention with its soft salmon-pink blossoms, while N. William Doogue, a fine vigorous flesh-pink, and the more

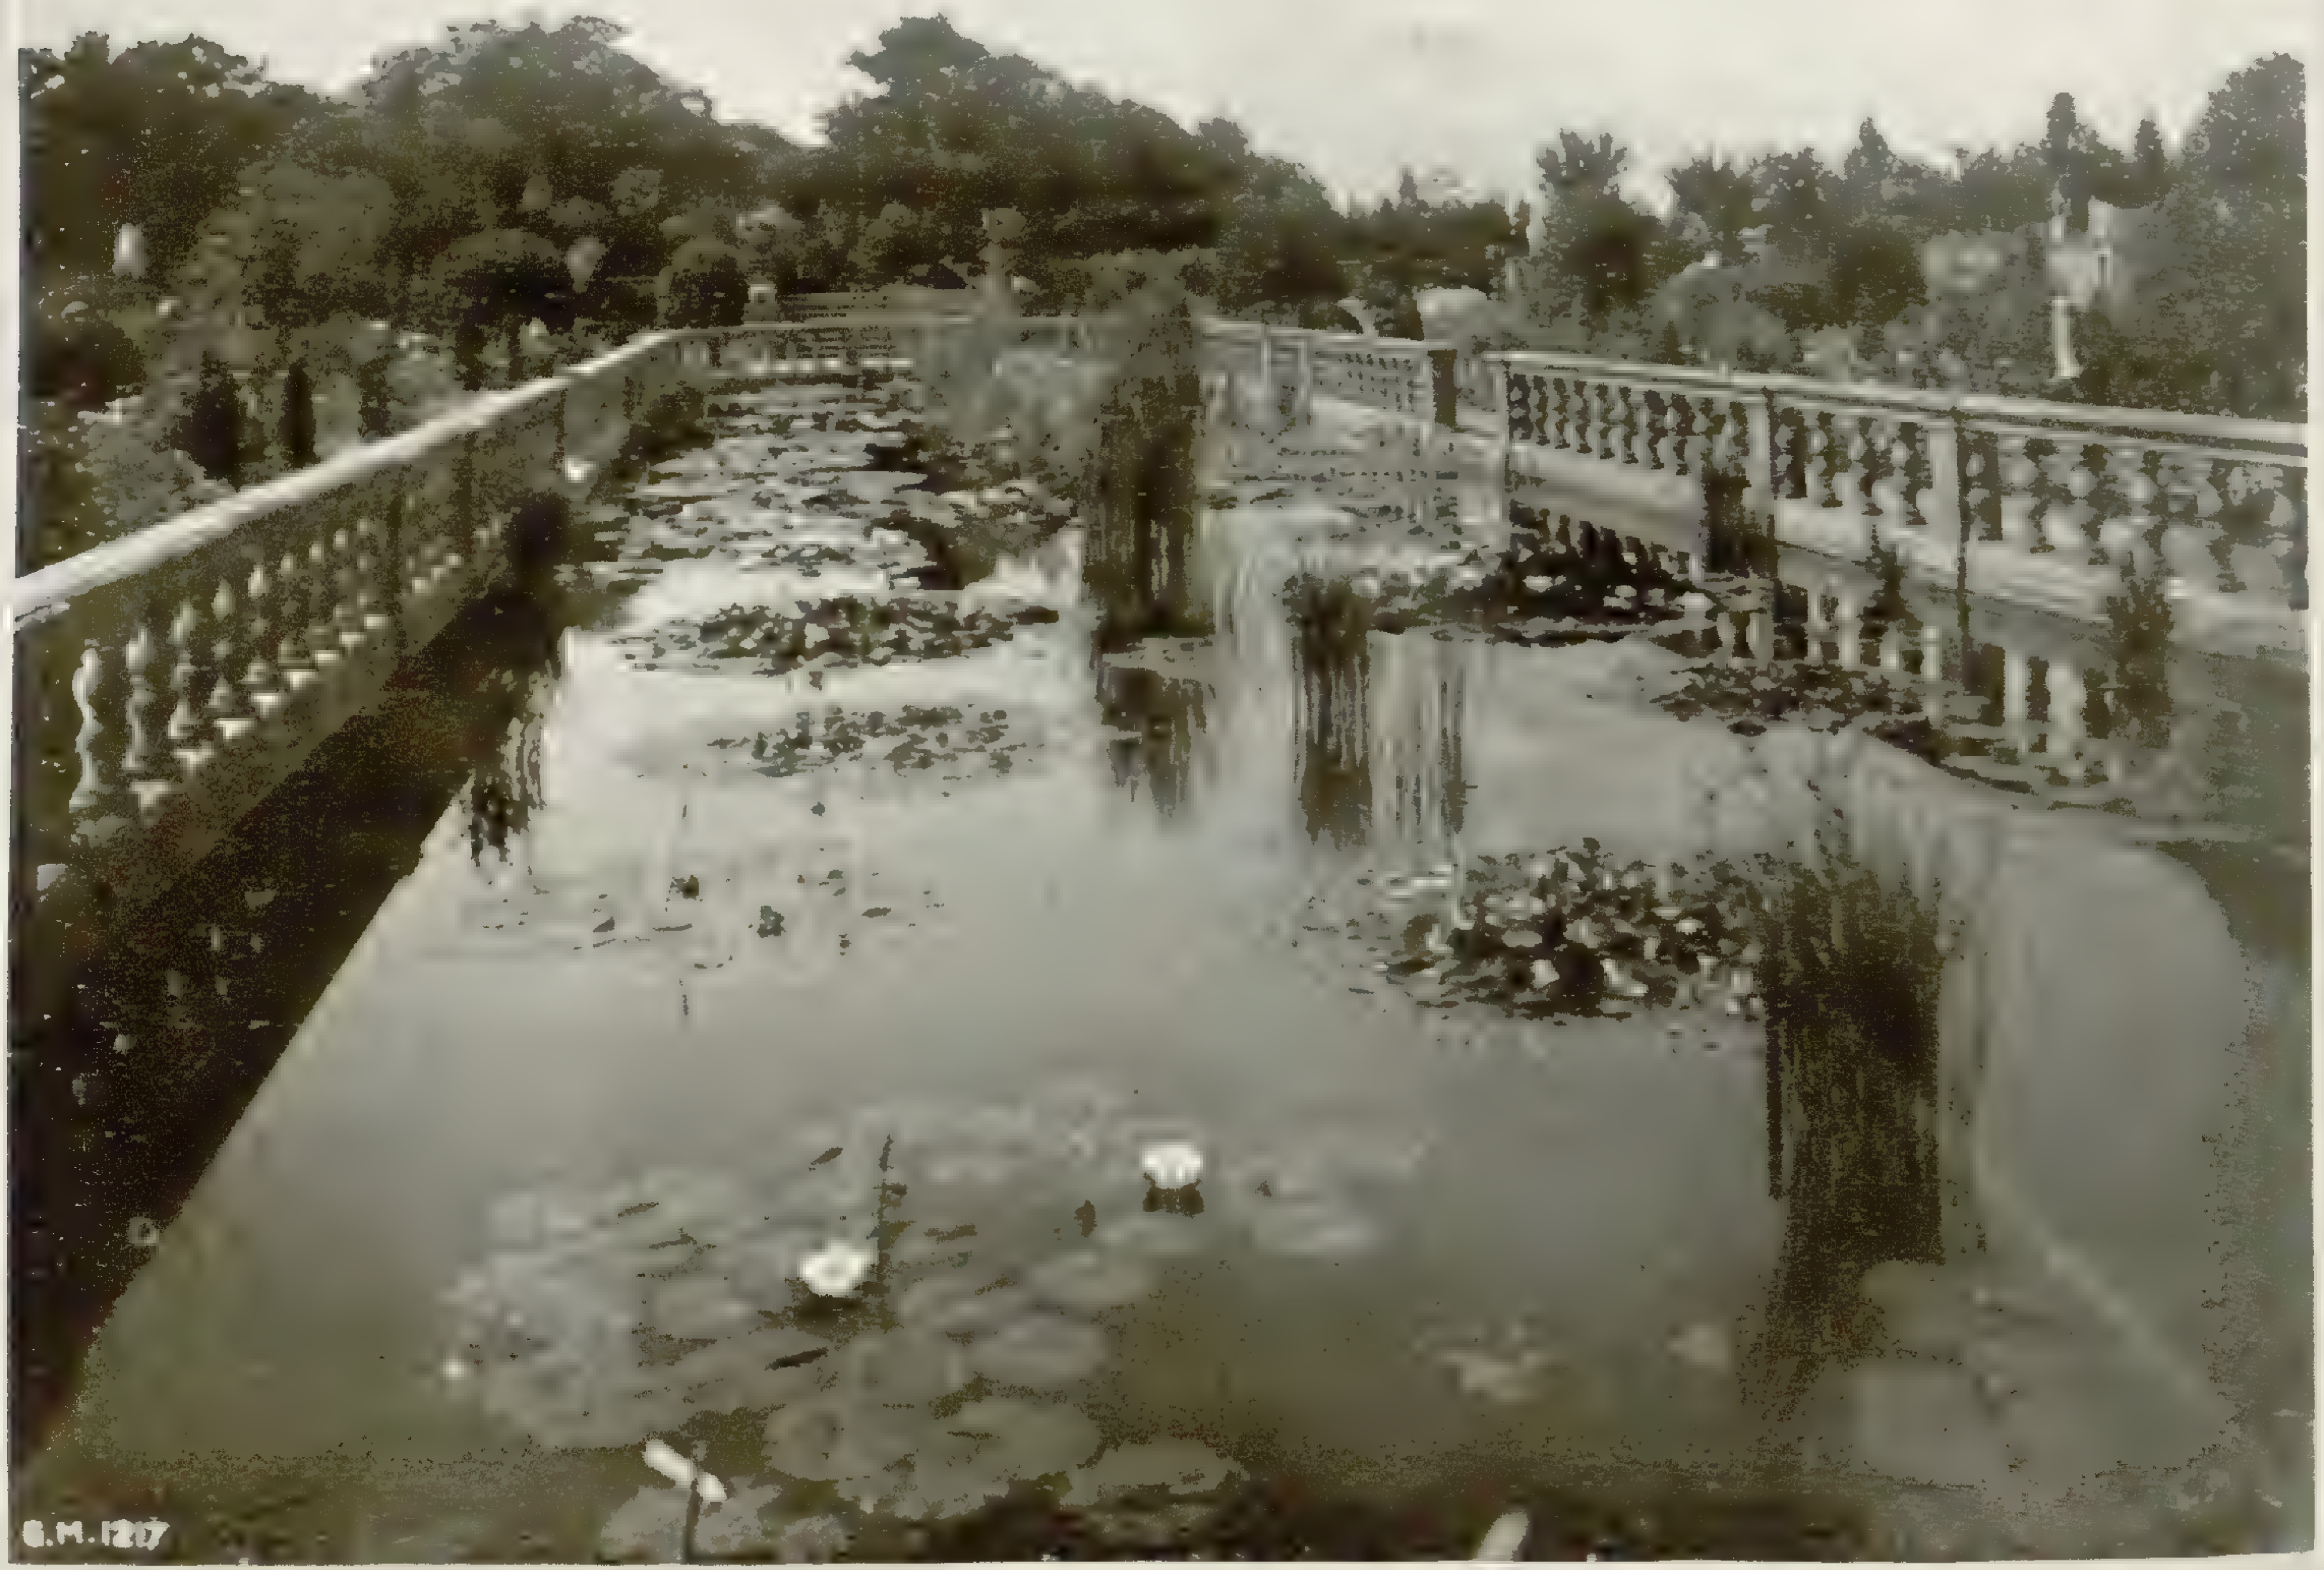
LAKE IN NATURAL STYLE WITH WATER LILIES

In the gardens of Gunnersbury House, the residence of Leopold de Rothschild, Esq. The collection of nymphaeas is comprehensive, and the conditions are highly favourable to a vigorous growth.

richly-hued N. Luciana, are both very worthy of note.

A selection of the bright-hued reds, crimsons, etc., would include the popular American variety, N. James Brydon, with its globular rich rosy-carmine blossoms. N. lucida is a magnificent rosy-vermilion, with grand foliage. N. Gloriosa has a superb sweet-scented blood-red flower, very double, and effective. N. Marliacea flammea, a very fine ruby-red, is spotted with white at the petal edges. N. Marliacea ignea is a flaming carmine of pronounced colour, and the ruby-crimson N. atropurpurea, with its luxuriant growth, is also good.

It is among the yellow, salmon, and orange shades that one meets exquisite colourings that are all too rarely seen in our water gardens. Take N. Aurora, for instance, with its changing colouring, first yellowish-rose, then orange-red, deepening with age into almost full red. Or N. Seignoureti, with its pleasing shades of pink and carmine upon a sulphur-yellow ground colour, and one has a vivid idea of the beauties of this group. N. Marliacea chromatella is a dainty canary-yellow, good at all points; N. Paul Hariot is a grand-flowered yellow, shaded with rose. N. fulva is pleasing, with its orange-red hues, and N. odorata sulphurea grandiflora is extremely valuable and free.



LAKE IN ITALIAN STYLE FOR WATER LILIES

At Easton Lodge, Dunmow, the Essex seat of the Earl and Countess of Warwick. The lake contains a fine collection of nymphæas, and, as so well shown, the arrangement is such as to prevent over-crowding.

Others there are like N. Graziella, N. Solfatare, N. flava, and N. chrysantha, very deserving of notice, to say nothing of the first-rate "novelties," which certainly deserve a notice to themselves. So far as garden varieties are concerned, the water-lily is a quite modern plant, and its creation, improvement, and extended cultivation form a wonderful page of floricultural history.

P. S. Hayward.

LILIUM TESTACEUM.

Like your correspondent "R. F." (page 334) I look upon this as one of the most beautiful of all hardy lilies, and one of the most distinct members of the genus.

The most complete account of the early history of this lily that has come under my notice is to be found in a publication entitled "Monographie Historique et Littéraire des Lis, par F. R. Cannart d'Hamale, President de la Fédération des Sociétés d'Horticulture de Belgique, etc."

Somewhat curtailed and freely translated the early history of Lilium testaceum is given as follows:

"There is also another lily with recurved petals, concerning the origin of which we have but a vague idea, but which, nevertheless, appears to be Japanese, viz., Lilium testaceum of Lindley (the Nankeen Lily). It was first discovered by M. Fr. Ad Haage, jun., of Erfurt, accidentally, in a large consignment of martagons he received from Holland in 1836, and with which it had been mixed. The plant was introduced into Belgium by M. L. Van Houtte, of Ghent, who received a case full of it from M. Von Weissenborn, of Erfurt, in exchange for some fuchsias. This exchange was made in 1840 or 1841, at which time there is no question that of this unknown lily three persons at Lille, in France, each possessed an offset. One only of these offsets flowered, and showed an umbel of pendant blossoms, with petals reflexed like the martagons, but larger, and of a beautiful nankeen colour, slightly tinged with rose, and dotted with a deeper tint at the base. The bright orange-coloured stamens served to add to the beauty of the flower. M. Van Houtte, who happened to be at Lille, was fortunate enough to see this splendid novelty. He eventually received from M. Von Weissenborn an order for fuchsias, with a postscript in the following terms: 'If by any chance you want the nankeen-coloured Lily I have a quantity at your service.'

"M. Van Houtte did not think twice about it, and seized with avidity the good fortune offered him. He accepted the exchange, and soon became the possessor of a case more than a yard square, full of Nankeen lilies of all sizes, the largest bulbs measuring more than a foot in circumference. This news soon spread to Lille, and caused much disappointment when the possessors of the three offsets were convinced that this lily of which M. Van Houtte had become the owner was the same as that which they had guarded so jealously. The nankeen lily passed from Belgium to England, where it flowered for the first time in 1842 with Messrs. Rollisson. It was figured and described in the 'Botanical Register' by Dr. Lindley in 1843, under the name of L. testaceum; Dr. Kruntze, of Halle, had described it as L. isabellinum, and it also bore the name of L. excelsum among gardeners. M. Rinz, sen., a nurseryman, of Frankfort, and another gardener at Leipzig, claimed to recognise in it an old friend which they had cultivated in their younger days. This was evidently a mistake, as no mention of this lily had been made in any work on botany or horticulture. We are more inclined to believe it is of recent introduction, and that the Dutch received it from Japan, with which country they were in constant communication. But is it really a true species? Or is it not rather the product of the white lily fertilised by one of the pomponium section? The general appearance of the plant would lead one to suppose so."

Forty years ago, when this book was written, it would have been far easier to obtain authentic information than it is now, and there is no doubt that the writer then took advantage of all available sources, without, however, learning the actual origin of this beautiful lily.

ORCHIDS AT ASHLANDS, NEWCHURCH.

There are few collections of orchids in the Manchester district that are better known than that of R. Ashworth, Esq., Ashlands, Newchurch, whose gardens I had the privilege to visit recently. Situated at a high elevation, the climb from Waterfoot Station is similar to that usually characteristic of the Lancashire moorsides, but when the ascent is made we leave the busy Rossendale, a thickly populated valley below, and looking out of the front windows, the wide expanse of open moorland is exposed to view towards the north and east. This is not an ideal aspect in which to look for a well-grown and practically up-to-date collection of orchids with the hope of finding the plants in the highest state of cultivation, but I was most agreeably surprised to find, in spite of the bleak position and the smoke and fumes from the thickly-studded chimney stacks in the valley below, one of the best-grown collections of plants to be found in the Manchester district.

LILY POND AND POOLS

At Sandhurst Lodge, the residence of Sir W. J. Farrer, where aquatics are grown extensively and with great success. The arrangement has much to recommend it for gardens where it is desired to group the nymphæas according to colour or growth, and plant them in separate pools.

Mr. Richard Ashworth does not confine his attention to a limited portion of the orchid family, but is a lover of the classes including those commonly known as botanical species. As space will not permit of my going fully into detail, I shall confine my remarks to some of the most prominent kinds in the collection. Odontoglossums have for many years been extensively grown—many noteworthy varieties are present, the plants generally in the cool divisions are in robust health, and, judging from the almost forest-like display of grand flower spikes, a good show of bloom may be anticipated in the near future. The following noteworthy subjects were showing for flower: Odontoglossum crispum Emperor of India, O. c. Robsoniæ, O. c. Mrs. Ruters, O. c. Lucianiæ, O. c. Black Prince, O. c. Coronation, O. c. Rossendale, O. c. Mdme. Linden, O. c. Virginale, O. c. Perfection, and numerous hybrids of recent introduction. In another house were numerous seedlings in various stages of growth, and these gave promise, judging from the recorded parentage, of including some very fine additions. One of the highest-coloured hybrids I have seen was here in flower, namely Odontoglossum Sirene (O. Vuylstekæ and O. c. Graireanum). The flowers were wholly red, suffused with purple, except the broad white margin at the outer edge of the segments. O. Lambeauianum var. Cinderella was of exceptional merit. Some good varieties of O. Waltonensis and O. percultum were also in flower.

Several masdevallias of the different sections were also included in this range, M. Veitchi grandiflora being the most attractive of the plants in flower.

The cattleya house contains many fine examples. My attention was particularly arrested by the numerous albino forms of C. Mossiæ, C. Trianæ, C. Gaskelliana, C. labiata, and the white-sepalled and petalled C. Warscewiczi Frau Melaine Beyrodt. These were represented by practically all the named varieties, and although the plants had been considerably cut up into divisions, they were in a most satisfactory condition of health. Among the large quantity of hybrids I noticed fine plants of Cattleya Armstrongiæ, C. Iris, C. Mantini, C. Fabia, Brasso-cattleya Queen Alexandra, and suspended from the roof were numerous primary and secondary hybrids of the Sophro-cattleya and Sophro-lælia sections.

As in most other gardens where orchids are cultivated in the Manchester district, cypripediums form a prominent feature, and conspicuous among the winter-flowering section were finely-grown plants of C. Germain Opoix, C. Gaston Bultel. Several forms of C. Thalia, C. Falshawiense, C. Bukmani, and C. insigne were represented by all the most prominent kinds, including the albino section. C. callosum Sanderi and C. Maudiæ were also to be seen. Suspended from the roof, grown in shallow pans, a C. bellatulum was especially noteworthy; such finely-cultivated plants are rarely seen. Another pleasant surprise was to find the numerous hybrids of C. bellatulum and C. niveum influence as one of the parents being so well and extensively grown. These included C. Boltoni, C. Venus, C. Daisy Barclay, C. Phœbe, C. Aphrodite, C. Mary Beatrice, etc. Associated with the cypripediums was a finely-grown batch of Miltonia vexillaria, which included many of the best-known forms; these are just producing their flower scapes, and give promise of a grand display. Several fine examples of the different varieties of M. Bleueana were also included.

The dendrobiums are grown suspended from the roof of the stove, and they include most of the best species and hybrids known to cultivation. The most prominent in flower at the time of my visit being D. Bryan, D. Sibyl, D. Ainsworthi intertextum, D. nobile virginale, and the curious D. n. R. Ashworth. The long sepals and petals are white; the elongated lip white with a bright rose disc. The stove included, among other notable subjects, a fine collection of codiums (crotons) remarkably well grown.

In the greenhouse several very fine plants of Lycaste Skinneri were in bloom. The cymbidiums also are most successfully grown, a point of interest as showing how well they may be adopted to the ordinary conservatory conditions of culture. Forced flowering shrubs are intermixed with telling effect among the soft-wooded plants and bulbs flowering at this season. The vines, rose house, tree carnations, and other departments of the garden also reflect credit on the gardener, Mr. W. Gilden. H. J. C.

THE MARGIN OF THE WATER GARDEN.

Water in some form adds greatly to the attractions of the garden, for, although perhaps few of us will echo Bernard Palissy's words, "It is impossible to have a spot proper for a garden unless there be some fountain or stream passing through it," all must recognise the infinite possibilities that the presence of water affords for enhancing the beauty and charm of our gardens. There are certainly many lovely domains where water is absent, but in visiting such there is a feeling that there is something lacking that prevents absolute perfection being attained. It is the absence of water that creates the impression, and one realises how much the prospect would gain were it possible for the grounds to contain a placid lakelet on whose surface blossoming water lilies floated, or a streamlet, now sonorous as it murmurs over its uneven bed, taking a deeper note when it plunges down a rocky fall, or silent as it glides into a shadowy pool, where the foam-flakes eddy beneath arching fronds of gracile lady fern or royal osmunda.

Water is of inestimable value in the garden, not only on account of the plants which may adorn its surface, such as the nymphæas, the yellow villarsia, and the white Cape Pondweed (Aponogeton distachyon) for still pools, and the Water Crowfoot (Ranunculus aquatilis) for slowly-flowing streams, but for the many delightful moisture-loving subjects that may be grouped at its marge.

Much depends on the surroundings of a lake, for it is on these that its effect upon the eye chiefly depends. If they are artistically disposed they heighten the charm of the water and often produce a picture of perfect loveliness, whereas, if the arrangement has not received careful consideration, the probability is that the scene will lack much of its possible beauty. It will be admitted by everyone that planting of some description is absolutely indispensable on the shores of a lake, for a bare sheet of water, with its banks destitute of every description of vegetation, misses one of the chief attractions of still water, that of reflection, since only the passing clouds can be mirrored on its surface. It being conceded that the margins of lakes should be planted, the next question to be considered is the manner of this planting, and the subjects to be employed.

Care should be taken not to overcrowd the margin. Water hemmed in by a barrier of tall and thick-growing subjects is worse than if its circumference were devoid of plants. Things should be naturally grouped, with open spaces here and there, so that the water may be approached from various points, and the effect studied without hindrance from intervening vegetation. A good lesson in grouping may be learned by studying the growth of our wild water plants. In June colonies of wild rhubarb may be seen growing on some half-submerged islet or sandspit, ever swaying with the rapid movement of the water that ridges itself into countless furrows as their strong leaf-stalks break its even flow. In still, shallow backwaters, where the foam-flakes swept by the eddies from the foot of the weir lazily circle, stand sheaves of tall young bullrushes, with yellow, broad-leaved water flags, "Flag leaves that let green water through," and above them, on the bank, the golden glory of the marsh marigolds, while in a shady reach the river's margin is clothed with the water forget-me-not's blue, a colour that seems to pale suddenly as a glint of more brilliant azure passes, and the kingfisher flashes adown the stream.

For noble beauty nothing is finer for the water's edge than the giant gunneras, G. manicata and G. scabra, of which the former is to be preferred, as its leaves are larger, often measuring as much as ten feet across. Polygonum cuspidatum and P. sachalinense, with arching, knotted stems, and heart-shaped leaves, make handsome isolated specimens, their land-grabbing nature, which renders them unfitted for the border, being here innocuous. The monkshoods are good waterside plants, the lately-introduced Aconitum Wilsoni, a beautiful plant with lavender-blue flowers, rejoicing in moist soil, and often attaining a height of seven feet or more. Some of the senecios are excellent for the neighbourhood of water, as they appreciate moisture at the root. Two of the best are of recent introduction. S. tanguticus has palmately-lobed leaves and large flower-heads composed of innumerable small yellow blossoms. In rich, damp soil it will reach a height of six feet, and is a very handsome object by the waterside. The other is S. clivorum, with large yellow flowers. The spiraea family, both shrubby and herbaceous varieties, delight in moisture, and are very pretty when in bloom. Among the best of the herbaceous section are the tall-growing S. gigantea, or camtschatica, the rose-pink S. palmata [illegible], the flesh-coloured S. venusta, and the white S. aruncus, and in the shrubby division S. Lindleyana, S. flagellata, S. japonica Anthony Waterer, and S. Thunbergi are good.

All of the primulas except two species, P. Palinuri and P. sinensis, appreciate moisture, and many succeed to perfection at the water's edge. The stately P. ja

A FINE GROUP OF SPIRÆA GIGANTEA ROSEA

Growing in the water garden in the nurseries of Messrs. R. Wallace and Co., Colchester. This is one of the best of the spiræas for planting in moist places.

nica, which, under favourable conditions, will attain a height of four feet, is a beautiful sight at Enys, in Cornwall, where it grows for a hundred yards along the side of a lake, under lime trees, and when the plants are in full flower the rosy glow reflected from their blossoms into the still lake is very beautiful. Many of these plants are growing with the water well above their crowns. P. sikkimensis is equally fond of the water, and there is no better position for it than by the side of a lake, as then its roots will be always moist, a condition indispensable to the successful cultivation of this primula. There are few more beautiful sights than a large colony of Primula sikkimensis growing by the waterside, with tall stems, two feet or more in height, set with clusters of as many as fifty pale yellow, drooping, fragrant blossoms in the early summer. P. rosea, the gem of the Indian primulas, is one of the most precious of its race. It requires porous soil and abundant moisture, and does best when planted close to the water, so that its roots may be always damp. In a certain garden half-a-dozen plants were procured some years ago, and these have spread to such an extent that there are now hundreds of self-sown seedlings, most of which are growing among the stones at the side of a stream, and are often overflowed.

For the shallow water at the margin of a lake or pond arum lilies (Richardia) form a most exquisite finish, but, although these are sometimes grown in the open as far north as Scotland, it is scarcely wise to recommend them except for the southwest, or Ireland. In a certain lake in Cornwall they grow in their thousands round the shore, and present a delightful picture in the early days of June when in full bloom. Rodgersia podophylla is a strikingly handsome foliage plant. Its large leaves, carried on tall stems, are deeply divided, and of a rich bronze-brown colour. The white flower spike, borne well above the foliage in June, is pretty, and it does best by the waterside. Two new species are R. pinnata and R. æsculifolia. The giant Saxifrage, S. peltata, is a native of California, but, as it dies down in the winter, is rarely injured by frost. In April it throws up a tall flower spike about three feet in height, bearing a large umbel of pale pink blossoms. The lobed leaves appear after the blooms are past, and are a foot in diameter, having a very handsome appearance.

Libertia formosa will do well by the water in the southern counties, and at Abbotsbury Castle is grown most successfully by the waterside. Other good plants for lake margins are globe flowers (trollius), the Summer Snowflake (Leucojum æstivum), yellow and purple Leosestrife (lysimachia and lythrum), Willow Herb (epilobium), Iris sibirica, Iris lævigata or Kæmpferi, Solomon's seal, Arundo donax, mimulus, and day lilies. Golden and cardinal willows should not be forgotten, as their bright colours are extremely valuable for winter effect, and the Royal Fern (Osmunda regalis) flourishes nowhere so well as by the waterside.

Wyndham Fitzherbert.

BOG GARDEN AT DIBDEN.

A charming scene in this Southampton garden obtained by the simple treatment of the water margin and the planting of choice subjects in the more open parts of the woodland.

HARDY ACQUATIC PLANTS.

In an even greater degree than is found to exist in other branches of gardening, the influence of water fascinates with an interest that is perennial. No other section of plants appeals with more irresistible charm than aquatics, and it is certain that much pleasure, combined with healthy stimulus and inspiration, is drawn from the beauty ever present in greater or less degree in every water garden. Our present purpose, however, rigidly discriminates between the water garden of Nature's forming and that designed by artifice; in the latter instance, it is of some importance that the conditions be favourable to the highest development of the plants, and also be present in such a form as to readily further the cultivator's aims, and be under direct control. It is of fairly frequent occurrence to find sumptuous water gardens in which choice subjects have been overrun by weeds or introduced plants of rank growth, owing to their not having been kept within bounds. When, through neglect, the places of choice subjects are thus usurped, what was intended to produce a delightful water scene in time comes to be regarded as a waste expanse and devoid of all beauty.

The question of restraint is of great importance with aquatic plants, for the simple reason that the greater part of their ramifications are concealed from view; indeed, so rapidly do some kinds increase, that everyone conversant with the care of water plants regards an annual thinning out in spring as the most essential part of their culture. Aquatics are not difficult to introduce into water areas, the best means is to plant in the ordinary way, using skeleton boxes or wicker baskets, and sink them to the desired depth. The plants soon root into the natural mud, after which they are capable of looking after themselves. Nearly all of them favour still water, and a layer of rich mud, and currents are best avoided, unless one can introduce some kind of breakwater, and thereby secure a sheltered cove, where several of the stronger kinds would invite success. There is also some advantage if the supply of water is somewhat limited, having regard to the area under water, or, where it can be controlled, as, in general, it is found that with a small supply the temperature of the water is higher and more uniform, therefore most conducive to the development of the better class of aquatics. The depth of water necessary may vary from a few inches up to three feet, in which the more vigorous growing nymphæas will find accommodation. In selecting positions for planting preference should be given the margins, and even the nymphæas should occasionally come close to the edge, so that the lustre and grace of the rounded or pointed petals and the central cluster of stamens may be enjoyed even to their minutest details.

Apart from the nymphæas there is a considerable number of aquatic plants conspicuous for their floral beauty, while in others interest centres in the leaves. To the former group belong Nuphar luteum, a rank growing native plant, with bold, deep-green rounded leaves, with deep lobes at their base. The flowers are ball-shaped and of a rich deep yellow. Like the leaves they stand clear of the water. It is easy to recognise, and increases by means of thick fleshy stems, which root into the mud and soon covers large areas when suitably planted in deep water.

A plant of large proportions, when seen under favourable conditions is the Giant Water Dock (Rumex hydrolopathum), the elongated, lance-shaped, pointed leaves stand clear above the water, and in autumn they become suffused with red which renders them very conspicuous. It succeeds in shallow water and is most suitable for large areas.

Brasenia peltata, commonly known as the Water Shield, is a subject having small rich bronze-coloured leaves floating upon the water, the flowers are purple, and are carried clear above the surface.

One of the most charming of water plants is the Cape Pond Weed (Aponogeton distachyon) also known as the Water Hawthorn, the leaves are long, narrow, and rounded at both ends, and rest upon the water. The flowers are large, furcate, and of a glistening white, except for the conspicuous jet black anthers; it grows under variable conditions—in water from one to two feet in depth, and in currents not too strong. It is one of the most desirable aquatics for small or large gardens, and once established it reproduces itself freely from seed.

Like the previous subject, Villarsia nymphæoides is most commendable. In habit of growth it resembles the nymphæas; the leaves are small, and the flowers are golden yellow, the petals being fringed. A colony of this plant in full flower is worthy of any water area, the flowers stand clear above the water, which renders them doubly conspicuous. This villarsia increases by means of a creeping root-stock, and requires to be carefully restricted, as it soon overgrows its allotted space. It succeeds in medium to deep water.

The Buck Bean (Menyanthes trifoliata) is most at home in shallow water. Its beauty one enjoys most when seen close at hand. The flowers are prettily frilled, and borne upon erect spikes, being most suggestive of a spray of horse-chestnut blossom. The leaves are deep green, and merely stand clear of the water.

The Water Violet (Hottonia palustris) is like the preceding, a native water plant of quaint interest. The leaves are deep cut into fine filaments, and are arranged in the form of a rosette, being slightly submerged. The flowers are white to mauve, and borne in whorls upon spikes which stand clear above the water. It succeeds in water up to two feet in depth.

Hydrocharis Morsus-ranæ is also most suitable for shallow water. The leaves are round to kidney shape, and the flowers are white.

A most distinct and handsome aquatic is the double Arrow-head, generally known as S. japonica plena. It is worthy a position if only for its noble sagittate leaves, but it is also one of the loveliest of hardy water plants, flowering freely and increasing rapidly. It succeeds best in rich mud, with twelve inches of water above the crowns, while the leaves and flowers project eighteen inches above the water level. The native species, S. sagittifolia, is of little importance as a garden plant, the flowers are too fugitive, and its whole energy is soon directed into seed production.

The American Pickerel Weed (Pontaderia cordata) forms fine masses of deep green arrow-shaped leaves. The flowers are in dense spikes of blue, and produced freely into late autumn.

Ranunculus lingua grandiflora is a noble plant, bearing immense buttercup yellow flowers upon leafy stems some four feet in height. It succeeds in deep water and increases rapidly.

Quite unlike any of the foregoing is Myriophyllum proserpinacoides, and esteemed for the great beauty of its finely-divided foliage arranged in whorls around the stems in the form of a cylinder. The stems rest lightly upon, and spread out in all directions upon, the surface of the water, while it develops threadlike fibres which root into the mud. It is not quite hardy, and is best wintered in some sheltered spot or taken indoors during winter.

After the nymphaeas the most effective water-plant is the Banded Rush (Scirpus Tabernæmontani zebrina), a subject having long cylindrical, erect, rushlike leaves, alternately banded pale green and white. This variegation is best developed when grown in shallow water, in a sunny position, and with a restricted root run. It is a most conspicuous object for some distance, and remains so until cut down by frost in autumn.

A distinct fine-coloured grass, requiring similar cultural conditions to the last-named is Glyceria spectabilis variegata. The leaves are ribbonlike, striped with white, red, and pale green, the colour coming best early in spring, and again in autumn.

Other good ornamental grasslike subjects are Cyperus longus and C. vegetus, closely resembling the Umbrella Grass so commonly grown in pots. Juncus spiralis, Scirpus lacustris, the true bullrush, and Typha angustifolia, are also worthy of inclusion when space admits.

I had overlooked the fine British plant Butomus umbellatus or Flowering Rush. It bears many umbels of bright lilac flowers, and blooms over a long season, reproducing itself freely from seed.

The above by no means exhaust the list of hardy aquatic plants, and must be accepted as indicating only the most showy or interesting for private collections. The enemies of water plants are rodents, water slugs, and water fowls, and no great measure of success will ever be attained when these are unmolested. Therefore, every means should be taken to suppress or destroy them as they make their appearance.

Thomas Smith.

Walmsgate Gardens, Louth.

ROSE NOTES.

I was much interested in the extract from the R.H.S. "Journal" relating to roses at Wisley, appearing in your issue for April 16. In every instance the varieties named have behaved in the same way here.

We have almost finished pruning, and must congratulate ourselves on the way our wood has come through the winter, as not a few of my correspondents express considerable disappointment at the condition of the wood of their roses. We were fortunate in our roses being dry when the most severe frosts were about, and I have little doubt this was the chief reason of our escape. Our worst look-out is among the buds upon standards, numbers of which appear to have been frozen, so that I am afraid we shall find many that will sleep long through the early summer, and fail to grow away healthily after being so frosted. On the other hand, several varieties that are by no means the hardiest are breaking well, and promising. In most cases the shoulders of the budded briers cut nice and sound, better than we expected, and the sap is rising rapidly

Brier stocks put in last season are looking better than I remember for many years. The wet settled the soil around them firmly and continued so long before we had any drying winds, that the stems have remained plump. Many of them are already breaking freely, and have just received their final treading up from wind waving. We have been fortunate in that respect, for the storms have been all around us without touching us to any appreciable extent.

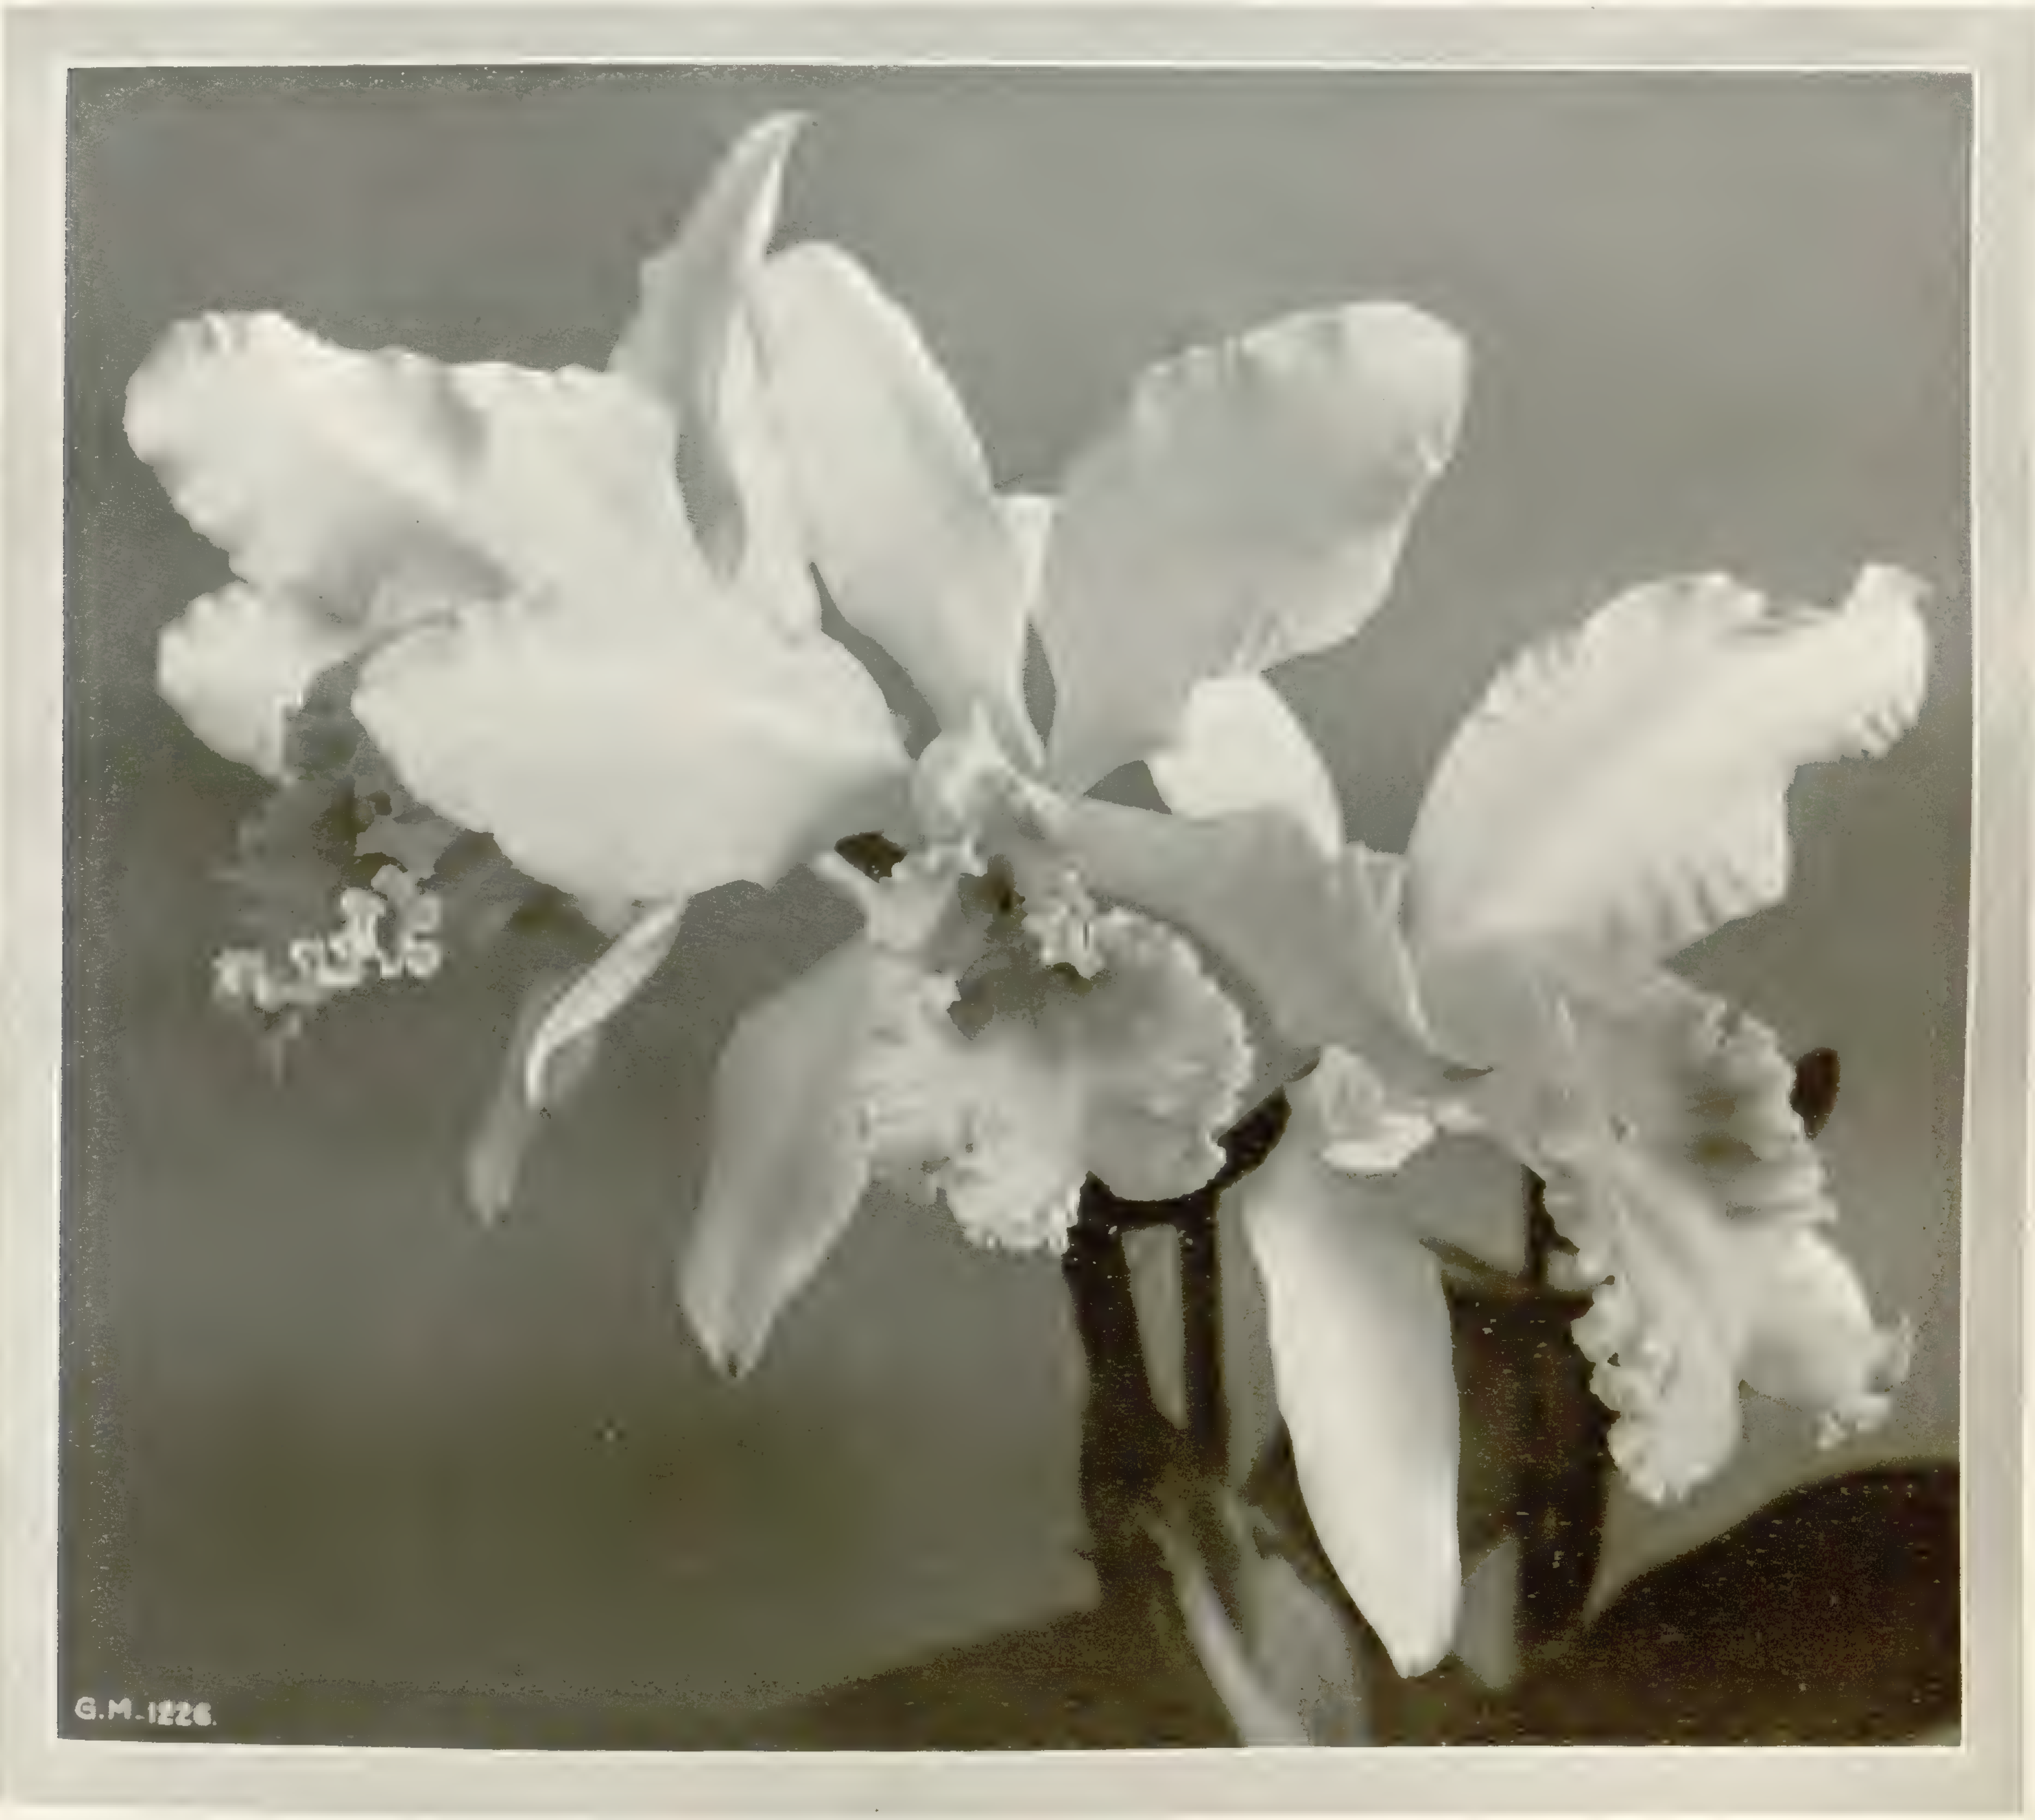
My Maryland is opening well under glass and is decidedly a grand rose. The bloom is carried boldly, and is most attractive in colour, lasts well, and is very sweet scented. I feel sure if your readers tried Gottfried Keller under glass they would continue to force this unique coloured rose. It makes a fine coat flower, the colour being intensified, and the blooms apparently coming a little more double than in the open.

A. P.

Lapagerias.—Lapagerias are unsurpassed among climbing plants for a cool, shady house, as in such a structure they grow freely and bloom profusely. Whether grown in pots or planted out they should have efficient drainage, and a compost consisting of turfy peat and fibrous peat in equal proportions and small quantities of sand and nodules of charcoal. The growth should be trained thinly near the glass, and be syringed freely until the flowers make their appearance. A plentiful supply of water is required during the spring and summer months, and weak liquid manure should be given about once a week during the season of growth. Increase of stock is effected by layering shoots in pots placed in convenient positions, or in the beds towards the end of the summer or in the autumn. The rose-coloured form can be readily raised from seed, but the white form does not always come true when raised in that way. Lapageria rosea and L. r. alba are equally desirable, and in purchasing the first-named it is desirable to obtain a good type, with [illegible] almost scarlet flowers.—P. P

NEW BEDDING OUT.

One of the most praiseworthy of all gardening arts is the effective use of plants that are of temporary beauty out of doors. unless they are so employed they remain little known because they require glass-houses for their culture. Some plants. notably the pelargonium and fuchsia. thrive well in windows. and the gardener should aim at introducing new varieties of these to notice: hardy annuals, whether sown or transplanted, are, of course, excellent for carpets and edges, and none should be allowed space that are not of finest quality.



CATTLEYA DUSSELDORFEI UNDINE WESTONBIRT VAR.

Flowers white, with yellowish throat. F.C.C., R.H.S., May 3. Lt.-Col. G. L. Holford (grower, Mr. H. Alexander), Westonbirt. Tetbury, Gloucester.

Each year the novel becomes more rare and more appreciated, not only in varieties but the method of their massing. One of the prettiest of beds can be carried out in single-plant rows of different named violas, a round shape looking west, and with either no centre height at all or this formed by a low stone urn also filled with violas. This means that named kinds of the plants must be bought, but they are singularly inexpensive. A fine stock can be worked up from them in one season without spoiling the floral display, and if neat labels are provided to tell the names, a great deal of interest will be aroused. When winter bedding follows, the gardener is sure to be requested to repeat this bed in Fancy or Show Pansies.

Roses for bedding out cannot be too highly recommended, especially dwarf polyanthas that are of such profuse and constant florescence. Nowadays, pot trees cost very little and are easily obtained, the bed gaining immediately in attractiveness when they are either sunk or carefully turned out in rows. masses, or, preferably, at wide intervals. I find that the direct planting method is the better, and if the roots are well soaked and spread out into some specially-prepared turf-loam, leaf-mould, and extra rotten manure, there will not be the slightest check experienced. A bed of the dwarf polyantha Mignonette, pale pink, set at twenty-inch intervals. on a carpet of pale blue violas, is certain to be successful. One of the white roses. Ma Paquerette, or White Pet, is even more striking, with a surrounding of pink violas. These roses can be kept low, and by cutting them back after one lot of bloom and giving liquid manure occasionally. they soon become full of blossom again.

Gerbera Jamesoni will be relied upon for a novel effect in countless gardens this year. When well forward pot plants are put out in June, in fairly rich light soil and full sunshine, the result is likely to be magnificent, so freely will the thin-petalled daisy blooms of cream, lemon. orange. scarlet. rose. apricot. crimson be yielded throughout summer and autumn. A bed should be given up to this newly-introduced plant, with, perhaps, some palms or Nicotiana affinis for centre height. and if an edging is needed, nothing will tone better with the colouring than the old-fashioned Echeveria secunda glauca. Another plan is to have groups of gerbera, and sow the rest of the soil with portulaca, double mixed, as this bright little half-hardy annual requires the same soil, warmth. etc.

Last year a bed of everlasting flowers proved a great interest in a villa garden. It was made up of Sea Lavenders or statices. helichrysums, or the familiar crimson. silver, gold, lemon. and dull mauve globe everlasting flowers. rose and white. yellow-centred acrocliniums. the large purple and double white xeranthemums. the Australian everlastings. Rhodanthe Manglesi, pink and gold, and R. maculata rosea and alba, with an edging of Edelweiss (Leontopodium alpinum). A centre mass of honesty had blossomed in spring, and the seed vessels had been allowed to form, so that silver money-sprays towered high during summer to add to the interest of this original bed.

A few rocks and lesser stones strewn about a lawn bed add to the delicate loveliness of tuberous begonias, double and single, and serve to protect them from winds that sweep level ground. To build up two or three high groups of rock, and plant the pockets thus gained, has a very charming effect. Verbenas, ivy-leaved pelargoniums, or Phlox Drummondi might occupy both bed and rock spaces, being graceful trailers. Another notion is to make a green grass mound in the centre of a bed, crowning the summit with flowers. The ivy-leaved pelargoniums can well be used, represented by one or more of its fine modern varieties of salmon, cerise, blood-crimson, or purple-maroon, and the full beauty of the plant will then be seen, both on the level, pegged down, and as a bank trailer.

Crossed arches over a bed mark it out from the others, and often provide welcome height in the garden landscape, and for climbers the azure-blue ivy-leaved half-hardy ipomæa may well be chosen, though the ordinary convolvuluses are, of course, lovely enough for any situation. It is necessary to grow a flower of contrasting colour beneath if the shape of the arches is to stand out clearly as seen from a slight distance. Beneath the pale blue ipomæa cream-coloured begonias would be handsome.

A tall pillar in a bed's centre, with cords or wires reaching almost from its summit and stretched out in tent style, to be pegged down at intervals along the edge, offers a noteworthy feature when climbed by Cobæa scandens, ipomæas, nasturtiums, or common canary creeper, even beneath a canopy of the last might be a bed of purple violas, and the mauve ten-week stocks or heliotrope.

Striking colour effects are possible. For example, an all dark bed could be made with Bidens atrosanguinea, maroon scabious, the Dianthus Mourning Cloak, maroon, edged with silver, and the black bedding pansies, such as The Sweep or King of Blacks. If foliage plants are desired in addition, beet and alternathera are suitable. M. H.

MOSCHOSMA RIPARIA.

This plant came under my notice last year, and favourably impressed me as a valuable one to grow for decorative purposes in a private establishment. The plumes of flowers are very attractive when arranged in groups in the conservatory, and they also lend themselves particularly well to association with Begonia Gloire de Lorraine. To most people the peculiar fragrance the plant gives off is agreeable, being much milder than, but similar to, that of Humea elegans. The cultural details appear simple. Cuttings put in during the spring readily strike root, and if grown in a warm greenhouse make handsome specimens by the autumn; or if the old plants are headed back they will break away into growth again; the roots can be shaken out and repotted in the way fuchsias are usually treated. After the plants have grown and matured their wood they will respond to light forcing, which means that they can be had in flower for three months of the year. A change is always welcome in floral arrangements, therefore I recommend those who have not given this plant their attention to do so.

C. Flack.

NEW PLANTS, ETC.

◆

ODONTIODA CHARLESWORTHI THEODORA.

For brilliance and intensity of colouring this must rank as the foremost of the odontiodas. It is a grand variety, raised at Rosefield, and its flowers are of good size and of a rich crimson-scarlet, the colour being full of life and sparkle under the influence of sunshine. F.C.C., R.H.S., May 3. De Barri Crawshay, Esq., Rosefield, Sevenoaks.

CATTLEYA DUSSELDORFEI UNDINE WESTONBIRT VAR.

A chastely beautiful cattleya producing large substantial blooms of creamy-whiteness. The large lip has a waved margin and a light lemon-yellow throat. The flowers of this variety are larger than those of any form of C. Dusseldorfei we have seen. F.C.C., R.H.S., May 3. Lieut.-Col. G. L. Holford, Westonbirt, Tetbury.

CATTLEYA MENDELI PEARL McBEAN

A beautiful cattleya, with light rose-purple sepals and petals, the colour showing quite a bluish tinge at the tips of the latter segments. The fine fringed lip has cream-coloured side lobes, with golden throat and deep purple apex. A.M., R.H.S., May 3. Messrs. J. and A. A. McBean, Cooksbridge.

ANEMONE NEMOROSA ALLENI.

A charming plant with rounded flowers that are of large size for the species, some being two inches across. The colour is a pretty shade of pink, approaching lavender. A.M., R.H.S., May 3. Mr. Amos Perry, Enfield.

MACLEANIA INSIGNIS.

The macleanias are closely allied to the thibaudias, and are natives of South America. They are evergreen and shrubby, and need greenhouse or stove culture. M. insignis has clusters of elongated, tubular, pendulous flowers of a bright orange colour. A feature of the plant is the bright bronzy-red colour of the young leaves. A.M., R.H.S., May 3. Messrs. James Veitch and Sons, Lim., Chelsea.

CARNATION MRS. C. F. RAPHAEL.

This splendid carnation has flowers as large as these of a Malmaison variety, but possesses the habit of a perpetual carnation. The flowers are of fine form, size, and substance, deliciously fragrant, and of a bright pleasing rosy-cerise colour. It will make a fine companion for Marmion, which is of similar size and habit. A.M., R.H.S., May 3. Mr. H. Burnett, Guernsey.

POLYANTHUS LADHAM'S BRILLIANT.

A beautiful and effective border polyanthus, bearing bold clusters of vivid crimson flowers, the rich colouring being thrown into strong relief by the golden eye of each bloom. A.M., R.H.S., May 3. Messrs. Ladham and Sons, Shirley, Southampton.

OSMUNDA PALUSTRIS CRISPATO-CONGESTA.

This is the pigmy of the Osmunda family, and one that ought to become very popular in connection with "Japanese" gardens. The whole plant is about six or eight inches high, the neat fronds having crisped pinnæ. The value of the plant is increased by the beautiful bronzy-red colour of the young fronds. A.M., R.H.S., May 4. Messrs. H. B. May and Sons, Edmonton.

VEITCH'S SCHIZANTHUS GRANDIFLORA HYBRIDS.

This is a very fine strain of the popular schizanthuses; the plants are about 2½ feet high, bushy, and free flowering. They are compact, and yet not sufficiently so to be formal or to lose in grace and beauty. The colours range from white to deep crimson and purple, those having bright markings on a light ground being especially attractive. A.M., R.H.S., May 4. Messrs. James Veitch and Sons, Lim, Chelsea.

NARCISSUS COOKSONIÆ.

This is a beautiful variety of the giant Leedsi type. The broad, overlapping perianth segments are cream-white, and the cup is of similar colour, but straighter and rather longer than in most of the Leedsi varieties. Madame de Graaff was one parent. A.M., R.H.S., May 3. Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

AURICULAS.

Canary Bird.—A strong growing, free flowering alpine variety, with bright yellow flowers and central ring of white paste. A.M., R.H.S., May 3. Mr. James Douglas. Great Bookham.

Dorothy Cutts.—Another beautiful alpine variety, golden-bronze, with white paste. A.M., R.H.S., May 3. Mr. James Douglas.

May.—A fine new seedling self auricula, its brilliant crimson body colour being heightened by the clear white paste. A.M., R.H.S., May 3. Mr. James Douglas.

HYDRANGEAS.

Hortensia var. Madame Emile Mouillère.—A very handsome hydrangea, with a great head of flower-like bracts, that are pure white, with crenulated margins, and between three and four inches across. The whole head measures fifteen or eighteen inches through. A.M., R.H.S., May 3. M. E. Mouillère, Vendom.

Hortensia var. Ornament.—This is much like the foregoing in size and style, but the splendid floral heads are blush coloured instead of white. A.M., R.H.S., May 3. Messrs. James Veitch and Sons, Lim., Chelsea.

TREE CARNATIONS FOR CUTTING PURPOSES.

The tree or perpetual carnations have now become firmly established in most gardens of any magnitude throughout the country, and during the last few years they have been grown with surprising success for embellishing the household. For several years the American carnations, as they were called after being sent out, did not very strongly impress gardeners or lead to their culture in anything like large quantities. This was due chiefly to the fact that they could not see sufficient return for the space the plants occupied, and did not care to devote a house specially to them. Except in very large gardens gardeners have to carefully consider what to grow to obtain the greatest amount of flowers from a given space. Thanks to the raisers we now have plants of great vigour, with better quality of bloom, while it is also possibly due to the fact that their culture is more perfectly understood by us. We now regard the tree carnation as a most valuable asset in the production of cut flowers throughout the winter and spring months of the year. And it is an open question whether, with the exception of the chrysanthemum, any plant serves us better from an economic standpoint, especially when we consider how continuously they bloom, the length of time the flowers retain their beauty, and the various uses they can be applied to for the house, while no flower is more appreciated for personal wear. If young gardeners are still in doubt about taking up the culture of perpetual carnations, let him dismiss the doubt, as satisfaction will follow if he proceeds on practical lines. C. Flack.

Cholmondeley Castle Gardens.

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the Gardening Year Book, by George Gordon, V.M.H., price 1s. net from booksellers, or by post 1s. 3d., from W. H. and L. Collingridge, 148, Aldersgate Street, London. The book is freely illustrated, and the cultural details thoroughly practical and up to date.

THE FORMATION OF LILY PONDS.

Few subjects are more attractive or call forth more general admiration during the summer and autumn months than a collection, large or small, of the improved nymphæas or water lilies. More especially are they attractive when the position selected is a suitable one, and naturally this is very important, as when the site selected is entirely out of harmony with the landscape generally, the effect is far from satisfactory. I can call to mind a few cases where pools that have been artificially made have, owing to unsuitability of sites, failed to prove satisfactory.

The Position.

Naturally, one must be governed, to a large extent, by the ground one has to treat, and though it is not at all necessary that the location is in a valley or low-lying ground, it is most essential that the pond should, where practicable, be placed in the lowest position, where it will have the appearance of being formed naturally. Very few places, even at high altitudes, fail to possess positions wherein the pools and ponds will suggest that they have been naturally formed. Equally suitable will be a regular or otherwise pond or pool, or an apparently winding stream. Although a few trees will do no harm when growing near water occupied by nymphæas, it should be borne in mind that the latter revel in sunshine, and especially so in the early part of the day.

Forming Pools and Ponds.

Having decided the position, the shape, and the size, the next important step one has to take is the excavation and depositing of the material. A practical man will generally be able to determine how to best use this in the immediate vicinity. Generally, he will, to a very large extent, utilise it in giving a more natural appearance to the pool when finished, as well as materially lessening the cost of making.

The deepest portion need not be greater than four feet, and the shallowest parts from eighteen inches to two feet. The stronger-growing plants I have found succeed best in from three to four feet of water, and the more miniature kinds from twelve to eighteen inches.

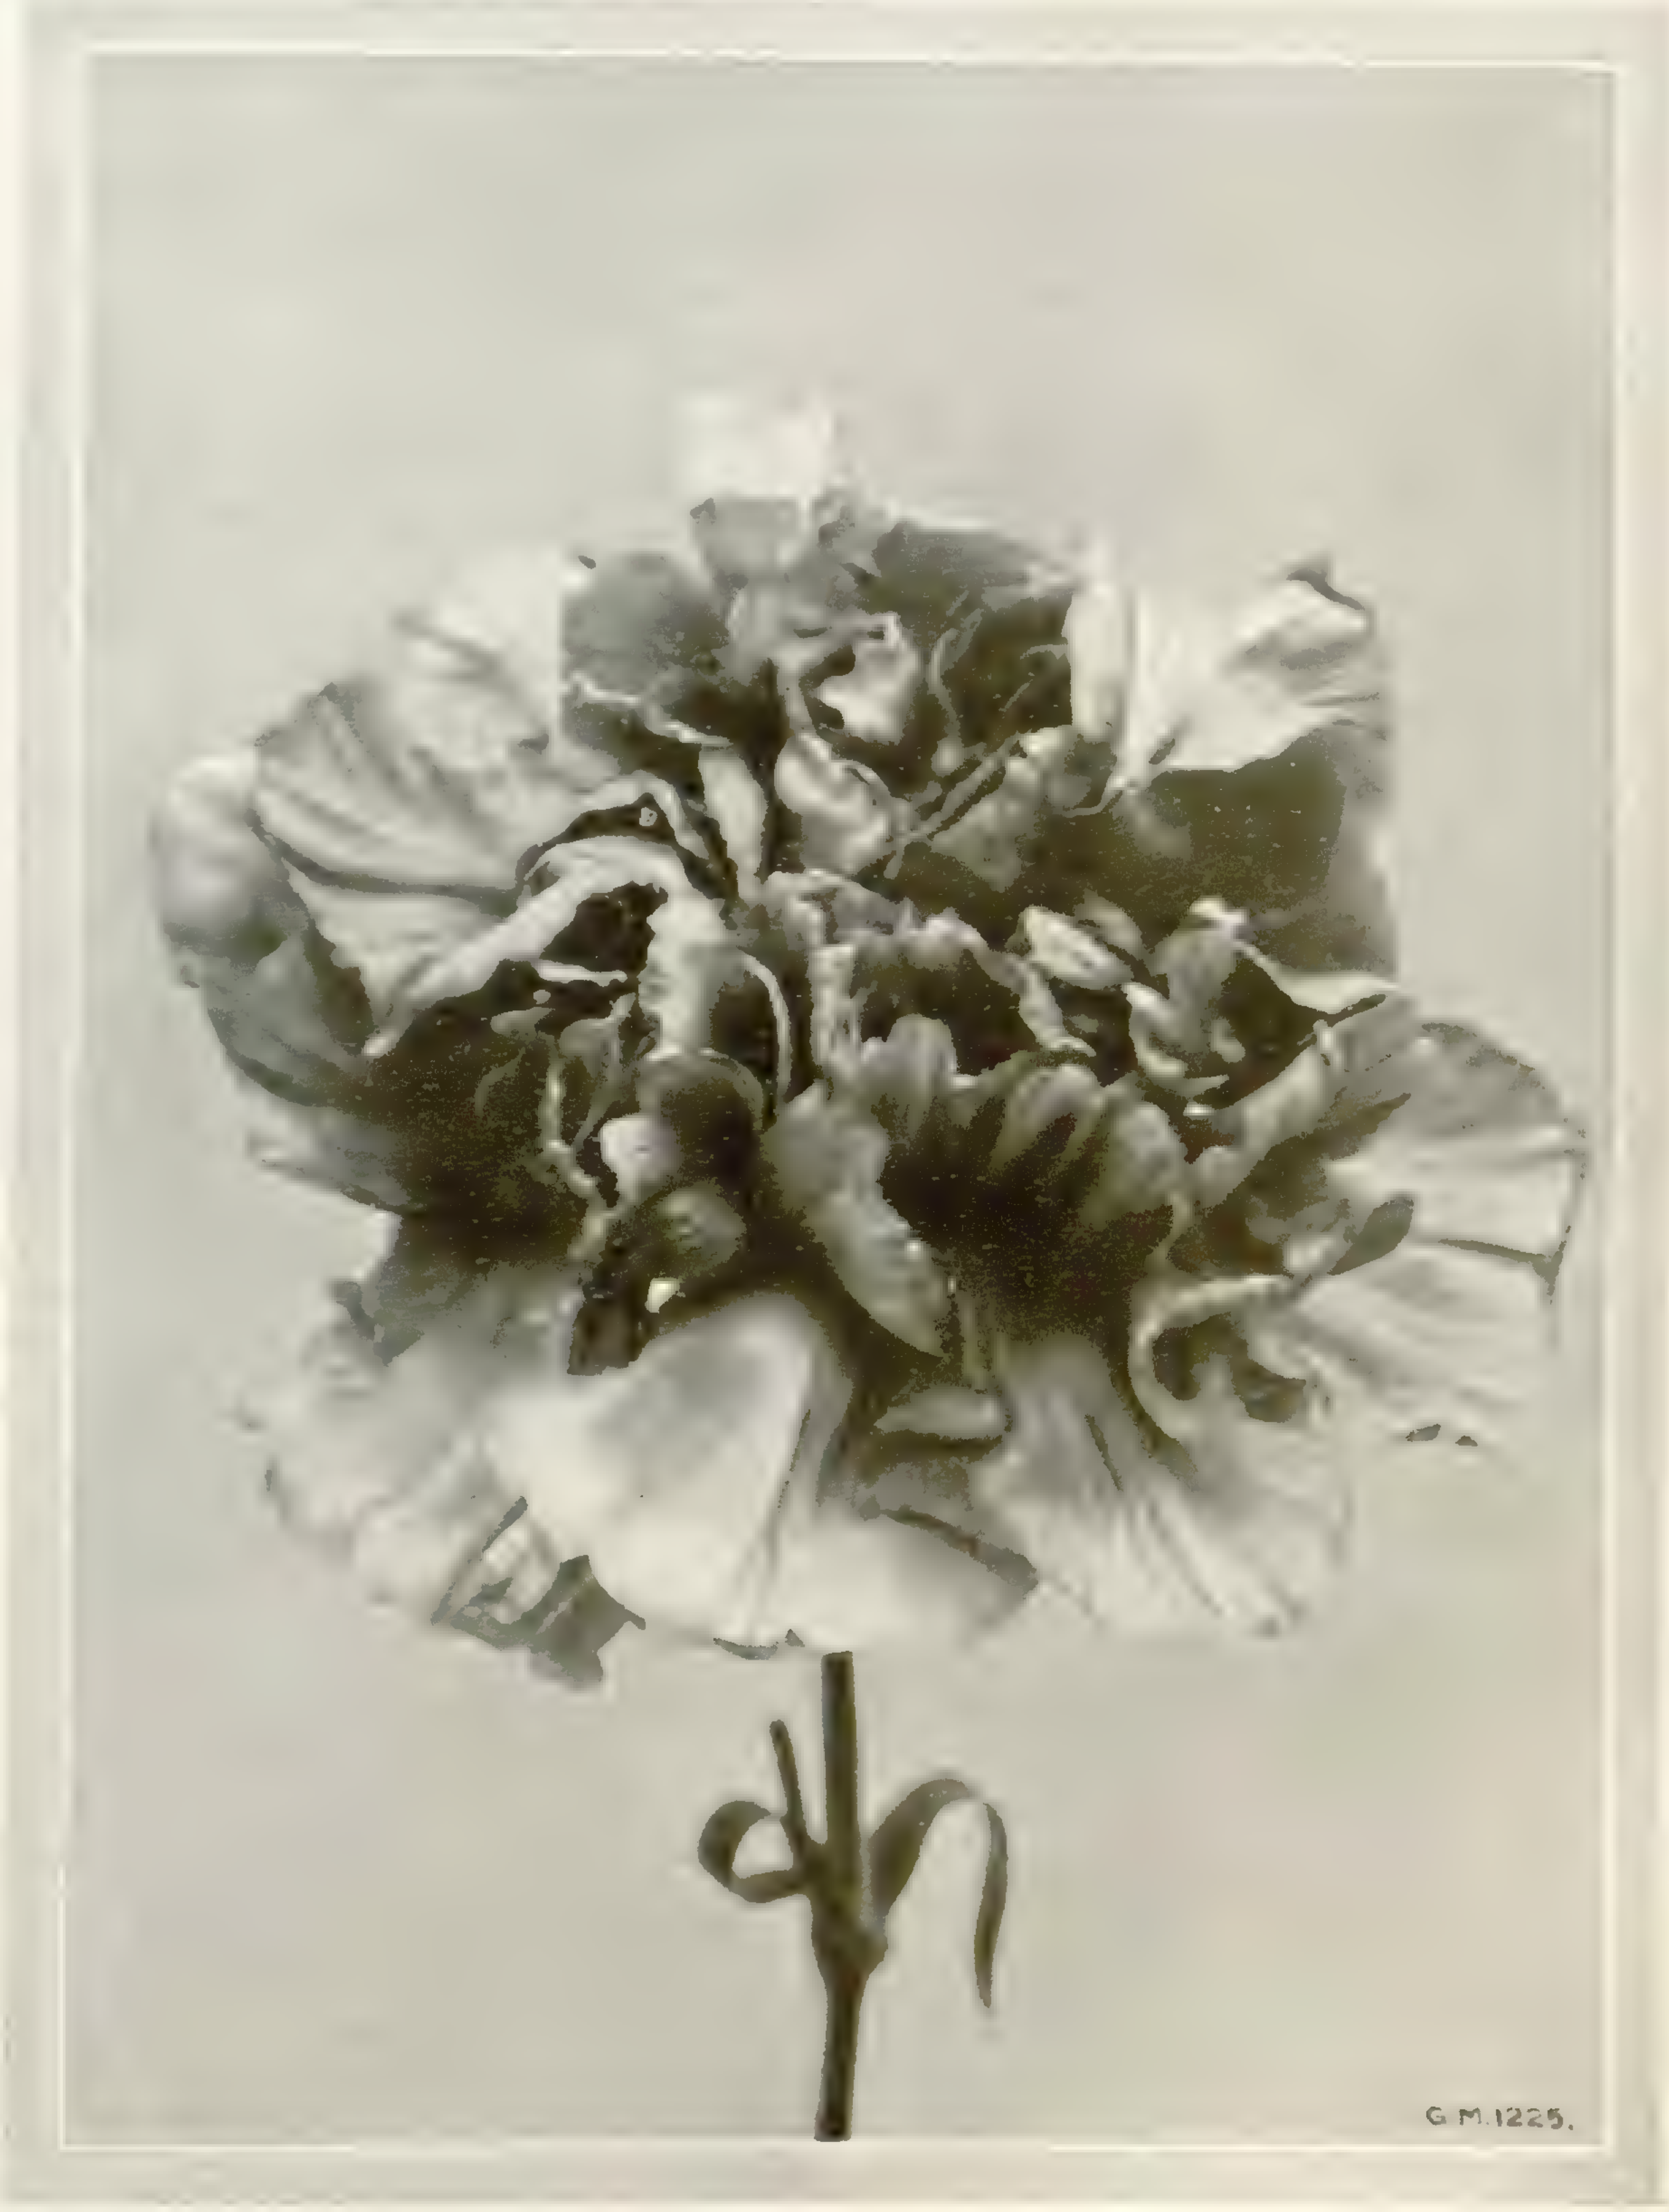
Making Watertight.

This may either be done by puddling or concrete. Where good clay is plentiful the first-named method is much the less costly, but even this requires to be carried out by someone experienced and well versed in the art of puddling. Especially is this so on a high elevation, and where the soil is of a porous character. It has been my fortune to have a great deal to do with this kind of work, and I have always found that unless it is expeditiously carried out the work is seldom a success. Immediately the material is worked up and used, it should be covered with water before it has time to shrink and crack, or in the winter before it has become frozen. The thickness of the puddle is really of very little moment. Three to four inches, if properly put together, is ample, but the most important of all is to make what is known as a puddle ditch around the whole piece of water. This is done by digging a trench, fifteen to eighteen inches wide, just below the level of the bottom of the pool, and two or three feet away from the edge of the bank. This should be thoroughly filled in with good puddle, and if this was more generally done one would hear fewer complaints of leakages in their ponds.

Concrete.

When the cost of construction is of little moment, I most certainly advise using concrete. It has so many advantages over the other method that it is well worth consideration. Among other good points, ponds with concrete bottoms can be easily cleaned out, the dreaded pond weeds can be readily excluded, and, in addition, the work of planting and rearranging the plants at any time is so much more simplified. Provision should always be made by fixing a valve at the lower end of the pool for either emptying it or lowering the water level when required. The concrete should be put together by skilled and practical men, and pockets at intervals should be built for holding the soil and plants. Old disused cattle ponds, etc., are frequently met with in a deplorable condition, even in places where many of the more beautiful water-loving plants, as well as the nymphæas, would find a most suitable home, and add considerably to the attractions and interest of the surroundings. I suggest that they be converted into pools for water lilies and other moisture-loving subjects. E. Beckett, V.M.H.

Aldenham Gardens, Elstree.



CARNATION MRS. C. F. RAPHAEL.

Flowers large, very bright, and deep rosy-pink. A.M., R.H.S., May 3. Mr. H. Burnett, Guernsey.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SHADING.—On the cool orchid houses the ordinary roof blinds will not now be sufficient during the hottest parts of the day to protect the plants from excessive bright light, and the permanent shading should be put on the south side of all span-roof structures containing odontoglossums, masdevallias, and allied genera. This not only protects the plants from excessive heat, but also permits of the roof blinds being drawn up earlier in the evening, the lighter shading being sufficient protection in the late afternoon. The warmer divisions may also be thinly covered at this season with permanent shading. This also greatly assists the plants and helps to maintain a desirable temperature, which it is impossible to obtain in bright weather, when the roof blinds are usually more than is necessary to protect the plants from disfigurement. It also permits the blinds being drawn from the roof earlier in the day, thus affording more light to the plants. Towards the end of the month the eastern sides of the roofs may also be permanently shaded, as this will afford the advantage of early morning light, and yet give sufficient protection to the plants.

SHADING MATERIAL.—We find that a little powdered whiting mixed in milk, with a little salt and linseed oil added, is as durable as anything we have used. Select a bright day, when there is ventilation on the houses, to apply permanent shading to the roofs, as then there is less moisture on the inside of the glass, and thus, to some extent, the streaky appearance caused by the moisture coming through the laps of the glass is almost prevented. A few minutes on a dry day is sufficient for this mixture to set. I must mention that in districts where there are considerable sooty settlements it is desirable that the glass should be clean before the whiting is applied.

DAMPING AND WATERING.—With the more favourable conditions prevailing outside more atmospheric moisture will be required inside. Provided the temperature of the houses is at the normal degree, it is desirable to damp the floors and stages, and syringe between the pots first thing in the morning. In the hottest hours of the day this may be done again, and later, when closing the houses in the afternoon; but, of course, due consideration must be given to the prevailing conditions. Dendrobiums, cattleyas, lælias, and East Indian plants should be examined daily to ascertain whether they require root moisture, and after this has been done the plants will be benefited by being syringed overhead, repeating this when moisture is rapidly absorbed by the atmosphere; but care should be observed that the moisture becomes evaporated from the foliage before the lower evening temperature is reached. Until the last week we have been experiencing excessively cold frosty nights, so much so that it has not been desirable to ventilate at night, but now that the weather promises improvement, the lower ventilators on the leeward side of the house should be brought into use. This will assist in keeping the air in circulation, and prevent any excessive moisture accumulating on the foliage of the plants.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

TREE CARNATIONS. — Young plants must not be allowed to suffer any check through having their roots potbound; they should therefore be transferred to larger pots as soon as they have occupied the soil with roots. Stopping the shoots is a debatable question; many recommend pinching out the points while the plants are in small pots. Other growers claim that plants which are not stopped until they are established in five-inch pots, and about eight to nine inches high, produce a greater number of strong flowering shoots than those that are stopped earlier. At whatever stage the pinching or stopping is done it must be after the plants have recovered from repotting.

CINERARIAS.—Seeds of the various types of cinerarias should now be sown in order to obtain plants for flowering early. The seed pans should be provided with plenty of rough material for drainage, filling the remainder with a mixture of loam, leaf-soil, and sand passed through a fine sieve. Make the surface soil smooth, and sow the seeds evenly and thinly, covering them with a very thin layer of soil. Cover the pan with a sheet of glass, and shade the surface from bright sunshine.

FREESIAS.—When these have finished flowering they should be allowed to complete their growth, and perfect their bulbs preparatory to ripening. They should be placed in a sunny situation, and where they have plenty of air; when the leaves begin to die down water should be withheld, and the pots laid on their sides until autumn, when the bulbs should be shaken out and repotted, selecting the largest for flowering.

LAPAGERIA ROSEA AND L. ALBA.—These climbers are now growing freely, and care should be taken that the shoots do not become entangled. If the plants are trained on a balloon-shaped trellis the young shoots should at first be trained to single strings tied out to stakes extending from the balloon, and after the shoots have become well ripened, and flower buds are appearing, the strings may be cut away, and the shoots trained evenly all over the trellis. Apply weak liquid manure to the roots at intervals, and syringe the plants each day. Lapagerias succeed well when planted out in a border and trained over the roof in the greenhouse, but when grown in a border slugs are troublesome, and protection must be given the young shoots.

NERINES.—When the foliage shows signs of turning yellow the supply of water at the roots should be gradually decreased until, when the leaves have quite died down, the roots may be kept dry. Nerines require a long season of rest, and during that period they should be fully exposed to sunshine in a cool house or frame.

STAKING.—Many plants now require some means of support, and it is bad management to withhold stakes in cases where they are required. At the same time it is a bad plan to use too many stakes. A stake should never be out of proportion to the size of the plant it supports. In the case of quick-growing plants under glass it is better to use a second stake in the course of a few weeks, rather than a large one to begin with. While the ties must be made sufficiently tight to keep the plant steady, it is obvious that allowance ought to be made for increase of size in the growing stems.—W. Staward, Belford Hall Gardens, Northumberland.

THE FLOWER GARDEN.

BEDDING OUT should not be too hastily commenced, and only those plants that will resist a few degrees of frost should be planted during the next week or two. A great deal, however, depends upon the position and surroundings of the garden. Where a mixed style of bedding is carried out, it is well to avoid undue formality in the arrangements. At the same time, the whole should harmonise with the surroundings. Standard plants, varying in height, colour, and habit, according to the character of the plants with which they are to be associated, might be used, disposing these in the general arrangement with a view to the harmonious blending of the whole. Standard fuchsias, pelargoniums, heliotropes, plumbagoes, etc., might be so used, and these, with an undergrowth of ivy-leaved pelargoniums, verbenas, Lady Plymouth pelargonium, dwarf ageratums, petunias, cupheas, etc., or a carpeting of coleus, iresine, mesembryanthemums, sedums, antennarias, echeverias, or other dwarf-growing foliage plants, produce a varied and pretty effect. We have frequently used these subjects in this way, and the beds are practically furnished from the first, without appearing to be overcrowded.

LATE-STRUCK PLANTS should be kept growing freely as long as possible, hardening them off for a few days before planting out. Annuals that have been sown in frames are now strong enough for planting out, and due advantage should be taken of warm showery weather to deal with them. Before planting out it is desirable, in most instances, to give the soil a good dusting of lime, or soot, and a rough raking over at the time of planting is all that is then needed.

SEDUM SPECTABILE is a very useful plant for the flower beds or borders, and it is a wonder that it is not more frequently used, for it is attractive alike in leaf and bloom. It is perfectly hardy, and towards the end of the summer and early autumn months each growth is terminated by a huge cluster of rosy-purple flowers, which usually remain in good condition for several weeks, or until damaged by heavy autumn rains. With the advent of winter the growths die down, and the roots lie dormant during the winter months. It is exceedingly effective in a mass, or as bold rows in borders, or shrubbery edgings, and is easily increased by division during early spring.

THE ROCK GARDEN AND HARDY FERNERY will now need attention. Remove all seed pods and decaying flowers from the earlier flowering subjects. Couch grass is often very troublesome at this season of the year, and should be relentlessly rooted out as soon as it makes its appearance, otherwise it will quickly overrun and destroy weak plants. The walks should be kept free from weeds, but not too rigidly smart and tidy; if moss-grown so much the better; indeed, in the rock garden or fernery this is quite admissable, and appropriate. Ferns from which the old fronds have not yet been removed should receive immediate attention, and additional soil should be given to all that need it, while, if the crowns are still dormant, transplanting may yet be done.

BULBS and other plants growing in the wild garden, should remain undisturbed for a while, and under no consideration should the foliage be cut down before the growth ceases and shows signs of ripening. — W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

MULCHING.—Towards the end of this month fruit trees in the open quarters should be mulched with farmyard manure, laying it on the surface as far as the roots extend. A little intelligence should govern the operation with regard to the quality of the manure used for each individual tree. It is unwise to mulch fruit trees—especially young ones—which make strong, healthy shoots, and bear little or no fruit, with a rich nitrogenous manure; trees of this description should receive a dressing of stable litter, whereas trees that have set good crops of fruit, and also those which are known to bear good crops annually, should be dressed with a richer and heavier manure. As a rule, all small bush fruits, when good crops are anticipated, should be mulched with decayed cow or pig manure. Where strawberry beds have not been mulched this work must not be delayed a day longer; it is wise at this season of the year to use clean stable litter or straw.

WALL TREES.—Protecting material on all peach and nectarine trees can be dispensed with; pear and cherry trees in flower will probably still require further attention, especially those grown on east and north walls. Cordon or horizontally trained pear trees should have their buds rubbed off a few inches below the leading, or extension shoot, to assist them to make vigorous growths, and these should be carefully tied to protect them from being broken off by the wind. Peaches have set their fruits well this season here, and a commencement should be made to remove the badly-placed ones, not thinning too much at this stage. The same method should be adopted when thinning the fruits of peaches and nectarines as that advised in the last calendar for disbudding, exercising patience and care when performing this operation. Proceed with the disbudding of all wall trees as they require it, and keep in check aphis, black-fly, etc., by frequent sprayings with some approved insecticide. Owing to the recent heavy rainfall fruit borders under walls are in a moist condition, and at present there is no necessity to water the trees. However, where liquid farmyard manure is procurable a good soaking should be given to trees that have set good crops. While the borders are in a moist condition this will materially help the trees to make strong healthy growths, and also tend to the production of fine-flavoured fruits.

GENERAL WORK. — Attend to trees that have been recently grafted. Give the grafts a light syringe with tepid water on bright, clear days; where trees have been grafted in exposed positions it is advisable to support the grafts with small, strong stakes, securely tied to both stock and scion; remove all growths that develop on the stocks below. On many kinds of fruit trees "suckers" will soon be making their appearance, and these should be removed as soon as possible. Filberts and cob nuts should also receive careful attention in the removal of all suckers, as these check fruitfulness.—Henry R. Farmer, Cardiff Castle Gardens.

ROYAL SHOW

LIVERPOOL,
June 21st to 25th, 1910.

71st ANNUAL EXHIBITION of Live Stock, Poultry and Farm Produce; Jumping, Horse-Shoeing and Butter-Making Competitions, Agricultural Education, Forestry and Horticulture.

HORTICULTURE
ENTRIES CLOSE ... JUNE 4.
Live Stock Entries close May 20;
Poultry Produce and Competitions,
May 31.

Prize-sheets and Entry Forms will be forwarded on application to
THOMAS McROW, Secretary.

Royal Agricultural Society of England,
16, Bedford Square, London, W.C.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Auricula Society (Midland Section).

MAY 4 and 5.

A record success was the eleventh annual exhibition of this section of the Auricula Society. The auricula has been designated by an ardent lover and prominent expert as "such a perfect little gentleman, such an aristocrat of the people, no orchid, no brilliant coloured amaryllis, nothing that the tropics can produce, has the intimate sentiment of this exquisite piece of floral jewellery." This meeting proved to be altogether a sound one for the society, albeit no great growers from the South came forward, and only three from the North essayed to enter the lists, one being Mr. J. C. Dryden, a grower from Northumberland, who forwarded his plants, as, owing to the miners' strike, he could not afford to attend personally, more's the pity, for such an enthusiast.

The exhibition was opened by Miss Violet Vanburgh (of the Prince of Wales Theatre), who referred to the beauteous spring flowers and elevating influence evoked by its culture. In memory of the auspicious ceremony Mr. Richard Holding (the erstwhile hon. secretary) named his premier alpine seedling Violet Vanburgh, in honour of the accomplished lady. There was a large attendance of visitors, many of whom also visited the alpine rock garden and other portions of the well-kept Botanical Gardens, [illegible] now teeming with floral beauty. The quality of the show auriculas was of such a high standard and the competition so keen, that the adjudication was by no means of a perfunctory nature. The first prizes in nearly all the classes were keenly contested. The leading class was for eight show auriculas, dissimilar, and here Mr. W. H. Parton, Hollywood, Birmingham, led with superb examples of Mrs. Henwood, George Lightbody, Favourite, Mikado, George Rudd, Richard Headley, Shirley Hibberd, and Harrison Weir; a close second was Mr. C. Winn, Selly Hill, Birmingham, whose gardener, Mr. J. T. Sheppard, staged [illegible], Mrs. Henwood, Lancashire Hero, [illegible], Mikado, Abbé Liszt, Eucharis, and Henry Wilson; third, Mr. Walter Shipman, Altrincham; and fourth, Messrs. Phillips and Taylor, Bracknell. For six varieties, Mr. Parton repeated his former success with Mrs. Henwood, Mikado, George Lightbody, Mrs. Potts, Shirley Hibberd, and Acme; second, Mr. Shipman, with Shirley Hibberd, Mrs. Henwood, George Lightbody, Mikado, Acme, and Harrison Weir; third, Mr. C. Winn; and fourth, Mr. W. C. G. Ludford. In the class for four plants Mr. Fred Simonite (the son of the deceased Sheffield veteran) won with a superb unnamed dark purple seedling, Shirley Hibberd, Molly Shipman, and George Lightbody; Mr. Francis Grazebrook second with Ruby, Mrs. Henwood, Vesta, and Olympus; Mr. R. Holding, Bournville, third; fourth, Mr. T. M. Eglington, Birchfields. For two varieties Mr. F. Simonite was again to the fore with Mrs. Henwood and Ruby; second, Mr. J. E. Dryden, who had Shirley Hibberd and an unnamed seedling; third, Mr. H. N. Miller, Perry Barr; and fourth, Mr. A. Lawton, Aston.

SINGLE PLANTS.

Green Edges.—Mr. F. Simonite came to the front, and his Henry Wilson was also accorded the premier prize; second, Mr. C. Winn with Mrs. Henwood, who also gained the third prize with Mrs. Henwood. Grey Edge.—Mr. C. Winn first with George Lightbody; second, Mr. Shipman with the same variety; third, Mr. Eglington with Marmion; and fourth, Mr. Shipman with George Lightbody. White Edge.—Mr. C. Winn first with Eucharis; second, Mr. Shipman with Conservative, and third with Acme; Mr. Parton fourth with Acme. Selfs.—Mr. C. Winn led with Harrison Weir; second, Mr. Shipman with Miss Violet; third, Mr. C. Winn with Mrs. Potts; fourth, Mr. R. Holding with Harrison Weir. Selfs: Primrose, Orange, Yellow, or Buff.—Mr. C. Winn led with an excellent Charles Winn (yellow), and was second with Daffodil; Mr. Grazebrook was third with Daffodil; and Mr. G. Danks, Handsworth, fourth with the same variety.

The class for maiden growers brought out four aspirants. For two show auriculas Mr. E. Sanders, Springfield Road, Sparkhill, led with Abbé Liszt and Mikado; second, Mr. C. Reeves, Handsworth, with Shirley Hibberd and Mrs. Henwood; third, Mr. Grazebrook; and fourth, Mr. Arthur Gilbert, Handsworth. For three varieties, dissimilar (local growers), Mr. W. C. Ladford led with Mrs. Henwood, Shirley Hibberd, and Mrs. Potts; second, Mr. Parton, with G. Lightbody, Mrs. Henwood, and Favourite; third, Mr. C. Winn. In the class for young amateurs only, for three show auriculas, Mr. C. Reeves led with William Brocklebank, Gladiator, and Mikado; second, Mr. G. Savory, with Mrs. Potts, George Rudd, and Mrs. Henwood; Messrs. W. H. Edmonds and J. Freeman brought up the rear.

ALPINES.

A resplendent scene was presented by this popular class of auriculas. The premier seedling alpine, Violet Vanburgh, exhibited by Mr. H. R. Holding, was largely noted as a gem of the first water. In the class for eight alpines Mr. C. Winn again distinguished himself with Mary Danks, J. F. Kew, Thetis, Miss Barker, Majestic, Unexpected, Dorothy Westmacott, and Golden Acme; second, Mr. W. Shipman, with Argus, Bluebell, Thetis, Duke of York, Mrs. R. C. Cartwright, Exquisite, Mrs. James Douglas, and Majestic; third, fourth, and fifth positions fell to Messrs. Phillips and Taylor, W. H. Parton, and Ludford, in the order named. For six varieties, Mr. R. Holding came to the fore with Unexpected, Mary, J. F. Kew, Duke of York, Miss Baker, and Majestic; second, Mr. C. Winn, with R. Dean, Mrs. Danks, Edith Winn (a seedling), Majestic, Miss Baker, and Thetis; third, Mr. Shipman; with Messrs. Parton and Eglington fourth and fifth. For four plants Mr. A. Lawton scored with Dean Hole, Argus, J. F. Kew, and Sappho; third, Mr. Wadley, with Thetis, Duke of York, Mrs. Gorton, and one unnamed; Messrs. W. G. Ellison, H. W. Miller, and Tom J. Stevens (the energetic secretary) followed. For two plants Mr. E. Danks led with Mrs. Danks and Modesty; second, Mr. Lawton, with J. F. Kew and Mrs. Martin Smith; Messrs. Grazebrook, Wadley, Dryden, and Ellison followed on.

SINGLE PLANTS.

Gold Centre.—Mr. R. Holding was placed first and second with Mary and Unexpected; third, Mr. C. Winn, with Chas. Winn; fourth, Mr. Parton, with Jack Parton; and fifth, Mr. Winn, with Mrs. Danks. Light Centre.—Mr. C. Winn first with Mrs. J. Douglas; second, Mr. Ludford, with Thetis; third and fourth, with Thetis and Hollywood, Mr. W. H. Parton; Messrs. Holding and Shipman fifth and sixth, each with Thetis.

For two plants in the Maiden growers' class Mr. G. Reeves scored with W. A. Albright and Exquisite; second, Mr. E. B. Conway, with Thetis and Argus; third, Mr. Tom Hughes; and fourth, the Rev. James Holroyde.

In the local growers' class for three varieties Mr. G. Savory led with Thetis, Argus, and Mrs. Danks; second, Mr. A. Gilbert, with Aglaia, Mrs. Gorton, and Thetis; third, Mr. J. Freeman; while Messrs. Tom Hughes, Ellison, and Sanders completed the winning positions.

The premier alpine auricula was Mrs. Marton Smith, from Mr. W. H. Parton.

SEEDLING SHOW AURICULAS.

Mr. E. Danks was first with two plants of 1907 and 1909; second, Mr. Ludford, with David Copperfield and an unnamed variety; third, Mr. C. Winn, with unnamed varieties. For a green edge variety Mr. Ludford was first and third, and Mr. Danks second, both having unnamed varieties. For one grey edge Mr. Danks led with Mr. W. Johnson (premier show); second, Mr. Ludford, with an unnamed variety; and third with Dr. Strong. In the class for four alpines Mr. Parton led with Mrs. Parton, and three unnamed; second, Mr. Winn, with Charles Winn and three unnamed; third and fourth, Mr. E. Sanders and Mr. E. Danks. For two seedlings Mr. H. Miller was first with R. Holding and an unnamed; second, Mr. Freeman; and third and fourth Messrs. E. Sanders and Mr. Tom J. Stevens. For one gold centre Mr. Ludford was first and Mr. Holding second. For one light centre Mr. Holding led with Dolly Sneed, and second with an unnamed variety; third, Mr. Eglington, with Sunrise; and fourth, Mr. Parton, with Mrs. Parton.

Polyanthuses were attractively staged. For six pots (six-inch) of fancy varieties Mr. F. Bostock, Northampton, was first; the Rev. J. Holroyde, Stapleford Vicarage, Notts, second; and Mr. W. G. Ludford, third.

HONORARY EXHIBITS.

These contributed much to the scenic effect of the auriculas and primroses.

Silver medals were awarded to Mr. W. A. Watts, St. Asaph, for a collection of polyanthuses and narcissi; to Mr. C. Winn, for a beautiful assortment of schizanthuses, to Mr. A. R. Brown, King's Norton, for a group of hybrid tea roses in pots, and some cup daffodils; to Mr. H. N. Ellison for a collection of ferns from West Bromwich.

A First Class Certificate was bestowed upon a yellow and a mauve coloured polyanthus from Mr. F. Bostock.

Highly commended was granted to auriculas from Mr. Ludford, Mr. Danks, Mr. R. Holding, and Mr. W. H. Parton.

Dutch Bulb Growers' Society.

At the recent meeting of the Narcissus and Tulip Committees the following awards were made at Haarlem:

Awards of Merit to Narcissus Glory of Wassenaar, a large-flowering yellow variety, with broad trumpet somewhat darker than the pale-coloured perianth; Narcissus Glory of Haarlem, a golden-yellow trumpet daffodil, trumpet of erect habit, with elegantly bended border, and broad, finely formed perianth; Narcissus Chantécler, a new variety, with large, clear citron-yellow coloured trumpet; Single early Tulip Orange Boven, a new dark orange-coloured variety, resembling the well-known variety Prins van Oostenrijk.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, May 3.

Present: Sir John T. D. Llewelyn, V.M.H. (in the chair); Dr. A. Henry, Messrs. A. Worsley, H. J. Elwes, V.M.H., L. Crawshay, J. T. Bennett-Poë, V.M.H., G. Gordon, V.M.H., J. Fraser, G. Massee, V.M.H., and F. J. Chittenden (hon. secretary).

THE LATE MR. G. S. SAUNDERS. — A letter was read from Miss Saunders thanking the committee for the vote of condolence passed by the committee at the last meeting.

SEEDLINGS OF SAXIFRAGA RHEI.—Mr. J. Fraser showed and commented upon a number of seedling forms of Saxifraga Rhei, raised by Mr. C. Read, of Ealing. He thought it likely that Saxifraga Rhei was a form derived from S. muscoides, and that it was in a state of mutation. It had given seedlings of a variety of forms which had received different names, including S. Guildford seedling, S. decipiens forms and so on. S. Rhei is found in a wild state in Transylvania, and many members of the committee considered it possible that the great extent of variation seen in the seedlings was due to segregation of hybrid characters.

POLYANTHUS, ETC.—The Rev. Roland Upcher showed some varieties of polyanthus which he had raised in his garden at Halesworth. They departed considerably from the florists' type of polyanthus, both in flower and leaf, but, in the opinion of most of the committee, they showed no evidence of crossing with other species of primula, pollen of which had been placed upon the stigmas of the parents. Mr. Upcher said no precautions had been taken to prevent the admission of foreign pollen.

Mr. Bartleet, of Shooter's Hill, sent a semi-double flower of a yellow auricula.

Mr. Jacob showed a series of coloured cowslip flowers.

MALFORMED ORCHID.—Mr. Crawshay showed an inflorescence of the natural hybrid Odontoglossum x Leeanum, every flower of which was malformed, all the petals, except the lip, being absent.

Bournemouth Gardeners' Association.

On Tuesday, May 3, a very interesting paper was read by Mr. P. Dowell, Astney Firs Gardens, Bournemouth, before the members of this association. The subject dealt with was "Begonia Gloire de Lorraine."

Mr. W. Reeves ably presided, and introduced the lecturer. It may be stated here that this type of begonia is extensively grown in the Bournemouth district, and that the cultural skill of many growers is apparent at the autumn shows held by the Bournemouth Horticultural Society. Mr. W. Shave, the assistant secretary of the Bournemouth Gardeners' Association, said he had noticed that a different cultivator had won the first prize, during a period of seven years, each year. This goes to prove the fact that there is a very healthy competition between the growers, and further proves that the general standard of excellence is high as regards the actual cultivation of the plants.

Mr. Dowell, having referred to the usefulness of the begonia as a decorative plant, went on to the subject of propagation, and to the general treatment of the plants for show purposes. He favoured propagation from leaves, asserting that the resultant plants were finer than those from stem cuttings. He preferred rather matured leaves taken off with a small heel attached; these, being duly trimmed with a very sharp knife, were inserted round the sides of pots filled with a light sandy compost to within about one inch of the top. The plan allowed of the leaves resting against the rims of the pots, and so preventing loss through damping, the stem of the leaf being very slightly inserted in the compost.

The lecturer recommended that two batches of cuttings be put in, the first in January and the second in March. He also preferred to place them in an open propagator rather than run the risk of damping by putting them in a closed frame. He further deprecated the practice of syringing the cuttings in an indiscriminate manner for the same reason, and advised that the soil be kept uniformly moist. The following are the principal points in the after treatment of the plants.

For the first potting equal parts of fibrous loam and leaf-soil and a small quantity of cow manure which had been previously dried and rubbed through a rather fine-meshed sieve was recommended. Subsequent repottings should be done in due season, the plants being put into five-inch, and then finally into 6¼-inch pots, the same kind of compost being made use of, with the addition of a small quantity of peat if the soil was of a heavy nature. In the growing season the temperature must never be allowed to go below 45 degrees, and some light shade was necessary in very bright, sunny weather. No pinching of the shoots was practised by the lecturer; the shoots were allowed to hang over the rims of the pots to form a base, and the central shoots were trained to form the pyramid.

Very little artificial manure was given, but weak doses of cow manure when the pots were well filled with roots. The shoots should be neatly staked and tied before the flowers formed, and while in bloom the plants must be subjected to a temperature of 55 degrees to 60 degrees. If required for any particular purpose on a given date all flower buds should be removed from the plants up to five weeks of that date.

As proving the general interest taken in the subject dealt with, nearly all the members present took part in the long discussion that followed. Some advocated shade, others not so much shade; a few preferred firm potting and light composts, while others liked a heavier compost and light potting. Altogether, the evening was a very enjoyable one, and was brought to a close by the tendering of hearty votes of thanks to the lecturer and chairman.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, S.W., on Monday, May 9. Mr. Thos. Winter presided. The Chairman made some very feeling remarks on the death of his Majesty, King Edward VII., and a vote of condolence to Queen Alexandra and all the Royal Family was passed. The Chairman also expressed the hope that a long and prosperous reign may be granted to his Majesty King George V. Seven new members were elected. The death certificates of three members were produced, and the following cheques were drawn in favour of their nominees, viz.: £72 19s. 7d., £44 14s. 11d., and 12s. 7d., being the sums standing to the members' credit in the ledger. Two members over 60 were granted their interest, as per Rule 18, and two members were granted 30s. each from the Convalescent Fund, in addition to their sick pay.

Dundee Horticultural Association.

The ordinary monthly meeting was held, under the presidency of Mr. Wm. Christison, in the Technical Institute, on the 3rd inst., when Mr. M. Chapman, Torbrey Nurseries, Stirling, gave an address on "The History and Introduction of Fruit Bearing Trees and Plants into Britain."

Mr. Chapman dealt in a racy and interesting manner with the grape vine, peach, nectarine, fig, orange, lemon, citron, banana, and the pineapple, nearly all of which he traced from their native habitat to the cultivated varieties now grown under glass in this country. In a wonderful way he described the beauties of the Rhine vineyards, the orange groves of Portugal, and the sunny valleys of the French Alps, and the peach orchards of Maryland and Virginia.

Professor Geddes, F.R.S.E., expressed his delight with the lecture, and could offer no adverse criticism. On the motion of Mr. James Bethel, Mr. Chapman was heartily thanked for his interesting lecture.

The exhibits consisted of a number of twigs of rare-flowering shrubs from Mr. Chapman's nursery; narcissi in new and choice varieties from Mr. David Halley, Roycroft; sweet peas from Mr. D. K. Meston; cinerarias and calceolarias from Messrs. Reed and Nicoll; and border auriculas from the Secretary.

Elstree and Boreham Wood Horticultural Society.

The lecture given on Tuesday, the 3rd inst., was entitled "Weeds and their Eradication," and the lecturer was Mr. J. G. Graham, of The Gardens, Colney Park, an old pupil of the late Mr. Pettigrew, of Cardiff Castle. He dealt with his subject in a lucid and interesting manner, and quoted the number of seeds a plant of many of the commonest weeds to be found in gardens is capable of producing, and the consequent necessity for their removal before the flowering stage is reached. To illustrate his remarks he exhibited a large and splendidly preserved collection of plants commonly regarded as weeds, and also fresh specimens neatly labelled of those now in season. Needless to say, these proved intensely interesting. A good discussion ensued, and the usual votes of thanks terminated a pleasant and well-attended meeting.

DESTRUCTIVE INSECTS.

By virtue of the powers vested in them under the Destructive Insects and Pests Acts of 1877 and 1907, the Board of Agriculture have made the following order, copies of which can be obtained on application to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W.:

Notification of Discovery of Insect or Pest.

1.—(1) The occupier of any premises on which an insect or pest mentioned in the schedule to this order exists, shall forthwith notify the fact, with particulars of the time and place of discovery to the officer appointed by the local authority to receive such notices, or, if no such officer has been appointed, to the Board; and, where practicable, a specimen of the insect or pest shall accompany the notice.

(2) An officer of a local authority who receives a notice under this article shall forthwith report the fact to the local authority.

(3) The local authority on receiving in any manner notice of the existence or apparent existence of an insect or pest mentioned in the schedule to this order shall forthwith transmit the information to the Board and take such steps as may be necessary to determine to what extent the insect or pest exists.

Powers of Entry.

2. An inspector or other officer appointed in that behalf by the local authority and any inspector of the Board may, upon production if so required of his appointment or authority, enter any premises on which he has reason to believe that an insect or pest mentioned in the schedule to this order exists or has recently existed, and examine any plant, fruit, crop, seeds, tubers, bulbs, layers or cuttings on such premises.

Action to be Taken by Local Authority.

3.—(1) An inspector or other officer of the local authority or of the Board, acting under their direction, may at any time and from time to time by a notice served on an occupier of premises on which an insect or pest mentioned in the schedule hereto exists or recently has existed, require him to adopt such measures for prevention of the spread of the insect or pest as are specified in the notice.

(2) Where a local authority have consented to pay compensation for such destruction,

the notice under this article may require the occupier of premises on which an insect or pest mentioned in the schedule hereto exists or recently has existed, to destroy by burning or other effective method all or any of the plants, fruits, or crops on the premises, and the local authority shall pay compensation for such destruction subject and according to the provisions in that behalf of the Destructive Insects and Pests Acts, 1877 and 1907.

(3) A notice under this article may prescribe the time within which the adoption of any measure thereby prescribed shall be completed.

(4) An occupier may appeal to the Board against a notice served on him under this article by an inspector or other officer of the local authority, and the Board may after consultation with the local authority, cancel the notice or modify its requirements in such manner as the Board think fit.

(5) For the purposes of this order a notice shall be deemed to be served on a person if it is delivered to him personally or left for him at his last known place of abode or business, or sent through the post in a letter addressed to him there, and a notice or other document purporting to be signed by an inspector or other officer of a local authority or of the Board shall be prima facie evidence that it was signed by him acting under the directions of the local authority or the Board as the case may be.

Penalty on Sale or Use for Planting of Diseased Seeds, etc.

4. Every person who shall knowingly use, or sell for use, for planting any plant, seed, tuber, bulb, layer, or cutting attacked by an insect or pest mentioned in the schedule to this order, or any seed, tuber, bulb, layer, or cutting which has been derived from a plant so attacked, and is capable of spreading the insect or pest, shall be liable on conviction to a penalty not exceeding £10.

Prohibition of Sale of Specimens.

5. It shall not be lawful, except with the written permission of the Board, to import, sell, or offer for sale a living specimen of any insect or pest mentioned in the schedule to this order.

Penalties.

6. Every person shall be liable on conviction to a penalty not exceeding £10, who—

(1) knowingly fails to give such notification as is required by Article 1 of this order; or

(2) fails to adopt such measures for prevention of the spread of the disease as are specified in a notice served on him under this order; or

(3) wilfully obstructs or impedes any inspector or other officer when acting under this order; or

(4) imports, sells, or offers for sale an insect or pest in contravention of this order.

Notification of Order.

7. This order shall be published by the local authority in accordance with any direction given by the Board.

Revocation of Order.

8. The Destructive Insects and Pests Order of 1908 is hereby revoked.

Execution of the Order.

9. Each local authority shall carry into effect this order within their district, and shall appoint such inspectors or other officers for that purpose as may be necessary.

Definitions.

10. In this order—

"The Board" means the Board of Agriculture and Fisheries.

"Local authority" means a local authority having power to execute and enforce the Diseases of Animals Act, 1894, and "district" means the area in which the local authority has such power to act.

Application of the Order.

11. This order shall apply to Great Britain.

Short Title.

12. This order may be cited as the Destructive Insects and Pests Order of 1910.

In witness thereof the Board of Agriculture and Fisheries have hereunto set their Official Seal this third day of May, nineteen hundred and ten.

T. H. Middleton, Assistant Secretary.

Schedule.

INSECTS AND PESTS TO WHICH THIS ORDER APPLIES.

The Vine Louse (Phylloxera vestatrix, Planchon).

The San José Scale (Aspidiotus perniciosus, Comstock).

The Mediterranean Fruit Fly (Ceratiti capitata, Wiedemann).

The Colorado Beetle (Doryphora decemlineata, Say).

The Large Larch Sawfly (Nematus erichsoni, Hartig).

The Potato Moth (Lita solanella, Boisduval).

The Gipsy Moth (Liparis (Oeneria) dispar, Linné).

The Brown Tail Moth (Euproctis chrysorrhœa, Linné).

The Nun Moth (Liparis monacha, Linné).

The Cherry Fly (Rhagoletis cerasi, Linné).

The Narcissus Fly (Merodon equestris, Fabricius).

Black Knot (Plowrightia morbosa, Saccardo).

Wart Disease or Black Scab of Potatoes (Synchitrium endobioticum, Percival).

Tomato Leaf Spot (Septoria lycopersici, Spegazzini).

Melon or Cucumber Canker (Mycosphœrella citrullina, Gressenbacher).

American Pear Blight (Micrococcus amylovorus, Burrell).

HIGHLAND COUNTY COUNCILS AND AFFORESTATION.

At the May meetings of the Highland County Councils now being held, the subject of the afforestation of this division of Scotland is receiving very earnest consideration. Time was when this subject played a very small part in Highland economics, but these days have gone, and leading Highland Chieftains, such as Lord Lovat, of Lochiel, Sir Hector Munro, Bart., of Foulis, and many others are bestirring themselves. These gentlemen know full well how very few industries there are in the Highlands, and the consequent dearth of employment. To obviate this state of matters, the following resolution has been most enthusiastically and with absolute unanimity adopted at several council meetings, including those at Inverness-shire and Ross-shire: "That, whereas schools for forest apprentices have been established in England and Ireland, and no such schools exist in Scotland, which has twice as much plantable land as the whole of the rest of the kingdom, this Council urges the need for the immediate establishment of a school for the training of foresters in a convenient woodland centre. This Council considers the present an opportune moment for bringing this matter to the notice of the Government, as the Development and Road Improvement Funds Act, 1909, provides funds inter alia for instruction in forestry and experiments in afforestation (Clause 1 (b), so that an opportunity is now given for remedying the injustice under which Scotland labours in this particular. That copies of this resolution be forwarded to the Secretary of State for Scotland, the Scotch Education Department, the Chancellor of the Exchequer, the President of the Board of Agriculture, and the Commissioners under the Development Act."

Some very interesting speeches were delivered at the meetings in support of the resolution, the majority pointing out that the soil in the Highlands was more suited for afforestation than the soil in any other part of the three kingdoms. It is also hoped that the adoption of the proposal will lead to a great increase of employment, and tend greatly to stem the stream of emigration which is now flowing so strongly from Scottish rural districts.

Be it noted, however, that the notion widely disseminated some time ago that afforestation would open a suitable field for that class known as the "unemployed," has now been pretty well exploded. Practical men know full well that forestry requires no such labour as may be obtained from the human drift of our large cities. What is required is the work of robust and more or less skilled woodmen—the class of men who are to be obtained alone in our rural districts, and who are best supplied by a fairly extensive system of crofts and small holdings. Herein lies one of the greatest recommendations of forestry as a source of useful rural employment. The work would supply labour and wages to the occupiers of the small holdings at the very season of the year when their labour is not required on their own holdings, and thus obviate the waste of time and energy on the part of these men, which is the bane of the crofting system pure and simple.

We have in the northern division of Scotland vast stretches of hill and moorland admirably adapted for the culture of timber, and forming an area the largest and most suitable for the purpose available in this country, and we have also a large rural population. Afforestation and agriculture, as those interested are well aware, go hand in hand, the planting of timber on a large scale being not only consistent with the maintenance of a considerable agricultural population, but really requiring it.

One pleasing feature in the forward movement in forestry is the evident fact that the public mind at large is at last really aroused to the importance and urgency of its development as a branch of rural industry in Scotland. It is well known that the large company of Scottish landowners interested in the afforestation movement, and who have a personal knowledge of the conditions existing, and prospects offered for it in different parts of the country, who recently paid a visit of observation and inquiry to the North-East of Scotland—duly chronicled in these columns at the time—have expressed themselves as specially pleased at some of the districts they visited, and are satisfied that on many parts of the north-east there are some of the finest and most promising fields open for the development of forestry as a great Scottish industry.

W. K.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Kingston Horticultural Society. — Wednesday, July 27, at the Town Cricket Club Ground.

Thunbergia laurifolia.—This is a stove climber not often met with, but yet where blue flowers are in favour it is a very desirable subject, and one there should be little difficulty in finding a suitable position for. There are frequently span pits with sufficient head room where this plant can be trained over the path, and such a place is a very suitable one. In such a position, and with a not too large root run, this climber will flower almost the year through, and it is a beautiful object. A peculiarity of Thunbergia laurifolia is the way in which fresh flower buds are formed behind the older blooms, and for this reason the flower stems should not be removed until they have completely withered. Mr. Emerson grows this climber remarkably well at Belton, Grantham, where it is only one of several beautiful climbers now so seldom seen.—T. H. Slade.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

DISEASED PLUM SHOOTS.—W. S., Kent: We are having the matter investigated. Grafted plums are not as a rule a great success. The growths were evidently very green and sappy, and suffered greatly during the winter.

SALSAFY.—J. P., Monmouth: The present is a good time to sow salsafy. Select a piece of ground that has been trenched or very deeply dug, but not recently manured—in fact, such a piece of ground as, earlier in the year, you would have selected for parsnips. Early sowing is a mistake, because the resulting plants will rush into bloom at the end of a hot season, and consequently the roots will be useless for food. Sow thinly in very shallow drills drawn one foot apart, and eventually thin the seedlings to eight inches apart. After thinning, the only attention necessary will be regular hoeing to keep down the weeds and encourage growth. Scorzonera may be treated in similar fashion.

SHADING DAFFODILS.—B. D. W., Orpington: When daffodils are grown for exhibition purposes it is quite necessary to provide some kind of shading for varieties having rich scarlet, orange, or crimson colouring in the cup or crown, because these colours bleach rapidly under the influence of bright sunshine. A movable framework of light wood covered with oiled calico forms a very handy and effective method of shading the flowers, and when the daffodils are always grown in beds of a given width the shading framework should be made to fit so that it may be used anywhere as circumstances demand. All the poeticus varieties are the better for a little shading when opening their flowers..

DISEASED TULIPS.—M. M., Dartmouth: The brown velvety markings are due to the presence of Tulip Mould (Sclerotinia parasitica), a fungus pest for which there does not appear to be a real cure. Carefully lift and burn all tulips that are affected, and if tulips are likely to be grown on the same site the soil should also be burned and new, clean soil be put in its place. This is necessary because the sclerotia stage of the fungus is often formed in the soil close to the affected bulbs, and may thus carry on the infection.

WINDSOR PEAR.—F. E. F., Coventry: This old pear is of moderate quality, and it is interesting because in many seasons it produces a second crop of blossom about midsummer, but the resulting fruits are rarely of any value. The variety was mentioned by Parkinson in 1629. Dr. Hogg considers "there can be no doubt that the Windsor pear is of foreign origin, and that it is the Bellisime and Suprême of the early French pomologists; but it must not be confounded with the Bellisime d'Eté of these later writers, and of Duhamel, who has made a sad mess of many synonymes, and on whose authority in these particulars there is no reliance to be placed. It seems at a very early period to have been distributed over Europe. It is mentioned by J. Baptista Porta, in 1592, as being cultivated about Naples, under the name of Pero due Volte l'Anno, and even in our own country we find it flourishing earlier than this, for Sir Hugh Plat, in giving the authority of "Master Hill" who lived about 1563, "Why trees transplanted doe alter," says, "Trees that bear early or often in the year, as pear trees upon Windsor Hill, which bear three times in a year; these, though they be removed to as rich, or richer soil, yet they do seldom bear so early, or so often, except the soil be of the same hot nature, and have the like advantages of situation and other circumstances with those of Windsor. And therefore, commonly, the second fruit of that pear tree being removed, doth seldom ripen in other places. This is the first notice we have of the Windsor pear in England; and it is, doubtless, from the circumstances of those growing on Windsor Hill, that the variety received its name. Early in the season, and before the earliest varieties of our gardens are nearly ripe, there are considerable quantities of the Windsor exposed for sale in the Covent Garden Market, which are imported from Portugal, and are said to be shipped at Oporto. We never could ascertain the name under which they were imported, but have not the slightest doubt about the identity of the variety." This was written in 1884, but we find no better history of this old pear anywhere.

HOLLYHOCK DISEASE.—C. P. L., Leamington: To prevent a recurrence of last year's attack you cannot do better than spray the young growths and leaves at once with weak Bordeaux mixture, following this with other sprayings at intervals of about a fortnight. If any plants appear to be badly diseased, and you will soon be able to determine this, root them up and burn them.

DAIRY COWS.—R. F. F., St. Alban's: Just the sort of book for your particular purpose is "Dairy Cows and The Dairy," by J. Walker, published by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C., and you can obtain it post free for 1s. 2d. It deals with cows and calves, rearing, feeding, diseases, etc., and tells all about milking, butter, and cream making, and describes the best style of building for a dairy and the necessary fixtures.

POLYANTHUSES AND PRIMROSES.—E. W. S., Doncaster: Primroses and polyanthuses are now so closely allied that the dividing line is hard to find. In garden strains of coloured primroses plants will now and again throw umbels of flowers showing how close is their relation to the polyanthuses or bunch primroses. We do not remember to have seen a blue primrose produce flowers polyanthus fashion before, but we feel bound to add that the blue colouring of the flowers sent is a long way behind the richness of colouring now to be found in true primroses.

SHOW DAHLIAS FOR THE GARDEN.—D. B. C., Sandbach: The National Dahlia Society's revised list of twelve show dahlias which make an especially effective display in the garden on account of their good habit and stiff flower stems is as follows: Crimson King, David Johnson, Gracchus, John Bennett, John Walker, Merlin, Mrs. G. R. Jeffard, Perfection, Queen of the Belgians, R. T. Rawlins, Spitfire, and Tom Jones.

NAMES OF PLANTS.

T. H. P., Sussex.—Eupatorium Weinmannianum.

H. W., Guildford.—A very poor flower; probably Le Rève.

E. J. B., Falmouth.—1, Ficus Parcelli; 2, Centranthus ruber; 3, Primula frondosa.

A. S., Derby.—Looks very much like a hemlock leaf; send flower head and stems later on.

J. B. W., Suffolk.—1, A very poor form of Cattleya Mossiæ; 2, Berberis stenophylla; 3, Cephælis Ipecacuanha.

R. T. S., Birmingham.—1, Acacia dealbata; 2, Dicksonia antarctica; 3, Trillium grandiflorum; 4, Chysis bractescens.

S. H. G., Woking.—1, Osteomeles anthyllidifolia; 2, Cydonia Maulei; 3, Odontoglossum crispum; 4, O. Hunnewellianum.

F. G. G., Oxon.—We are not able to identify the rose sent. Send blooms to the nurseryman from whom you purchased your roses.

CATALOGUES RECEIVED.

[illegible] LATOUR MARLIAC, TEMPLE-SUR-LOT, [illegible].—M. Marliac's new catalogue of nymphaeas, [illegible], and other aquatics comes opportunely, [illegible] this week devoting a great deal of attention to water gardening. In a four-page supplement to the catalogue M. Marliac describes twenty-five new [illegible] raised by him, their colours ranging from [illegible] through rose, red, and yellow, to brilliant [illegible] varieties.

G. COOLING AND SONS, BATH.—A useful pocket [illegible] of roses in pots, climbers, dahlias, and [illegible] plants.

[illegible] DUNCAN TUCKER AND SONS, 27, CAN- [illegible] E.C.—A handsomely illustrated and [illegible] catalogue of horticultural buildings of [illegible], ornamental and utilitarian. The [illegible] represent work of various kinds executed by this firm in many parts of the United Kingdom, [illegible] from simple frames for "French" gardening up to large and ornate conservatories and water gardens.

[illegible] AND LILLEY, LIM., ERLEIGH ROAD, [illegible].—A descriptive and illustrated catalogue of [illegible], conservatories, frames, and heating [illegible], as well as of portable kennels, poultry [illegible] sheds, stables, sports pavilions, etc., etc.

FORTHCOMING ENGAGEMENTS.

[illegible], May 20.—Special Bulb Show at Haarlem; [illegible].

[illegible], May 24.—Royal Horticultural Society's [illegible] Exhibition at the Inner Temple Gardens; three days.

[illegible] Society Meeting.

[illegible] and West and Southern Counties Show, at [illegible] two days.

A NEW CHOICE AND RARE HARDY PLANT.

Tunica Rosea fl./pl.—Without doubt one of the most beautiful plants of recent introduction, sure to find its way into every collection. Adapted for varied purposes. It belongs to the mossy section, foliage beautiful bright green, flowers double pink; appear about May and continue until autumn. A valuable subject for the rookery, for level ground, under rose trees, for covering graves, and makes a beautiful pot plant. Will grow in shade or full sun, in any soil, but does not like stagnant moisture; in any other condition stands the winter well. The Royal Dutch Hort. Soc. Awarded F.C.C., 1907. The Royal Hort. Soc., A.M., 1908.

4 to 6 inches. **1/6** each; **15/-** doz. May-Sept.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Sap.

Sap, which is practically the life-blood of plants, differs, however, very materially from the life-blood of animals in its nature, though it performs similar offices as the conveyor of nutriment to the various parts of the organism concerned. In the animal the blood is supplied by the conversion of nutriment taken into the digestive organs. and consists of a somewhat viscous liquid in which float an inconceivable number of corpuscules, which traverse the veins and arteries, and by their means pervade the entire system. taking up in their course the debris of matter which has been used up in the various vital processes and carrying this to the lungs, where it is practically burnt up by means of the oxygen there supplied by the breathing process, and so forming carbonic acid gas, which is then exhaled. The oxydized blood is then returned to the system through the arteries, and replenished by fresh supplies from the digestive system, passes on its round again, and so maintains the vital vigour. These corpuscules, too, consist of two kinds, most of them are mere inanimate discs, but a large number are actual living organisms, amoba-like in character, which are capable of attacking and devouring any inimical germs which have found their way into the circulatory system. This circulation, too, is effected by means of a powerful pump, the heart, which impels the arterial, or revitalised, blood in one direction, and by a sort of reflex action, draws into it the venous, or deteriorated, blood from the veins as a source of supply, the lungs, as we have said, acting as revivifiers. Sap, on the other hand, is supplied primarily from the soil by means of a more or less extensive root system in the soil, this system consisting of an immense number of absorbent points, or feeders, which not merely take up the moisture they meet with, but also such earthy salts in solution as are necessary for the plant concerned, and these points, or feeders, have undoubtedly the power of attacking, to a certain extent, the minerals with which they come into contact, and dissolving them so as to enrich the collected sap very materially. This sap is then conveyed upwards into the body of the plant through the stem or trunk, and through all its ramifications, until it reaches the leaves, which are practically the lungs of the plant. Here, under the vitalising action of light, the materials it has brought with it are combined with the carbonic acid gas which the foliage has the power of absorbing from the air, and by some exceedingly subtle chemical action these combined materials are broken up and recombined to constitute another class of sap entirely, capable not merely of contributing to swell the general structure of the plant, but of forming an infinite number of products, such as starch and sugar, innumerable essential oils, which give their characteristic odours and flavours to the plants concerned, but also boons and banes of innumerable kinds, and of infinite commercial value. This sap, thus altered in character and composition, is then returned to pervade the plant system, and perform varied service in building up the woody structure, forming the flowers, and last, but by no means least, shaping and perfecting the fruit and seed essential for plant reproduction. In this case we find nothing at all akin to a heart or force pump, the circulation here is induced by the transpiration of superfluous water from the foliar surfaces, and the consequent absorption by the cells of fresh supplies from the veins which pervade the leaves, this absorption being transmitted from point to point downwards to the root points aforesaid through the minute, but numberless, channels formed to that end. One great difference between the plant and the animal is that the food of the latter contains a large percentage of useless material which is rejected by the digestive system, while the plant roots only collect what is essential. and practically use it all. Commercially, it is the innumerable vegetable products which the foliage fashions from the sap, foods, fibres, timber, and chemical combinations which interest us mainly, but in recent times the very sap itself, in the shape of rubber and gutta percha, to say nothing of other gums or solidified saps, copal, and so on, has asserted its immense importance. Here the tree is robbed of its very life blood by wounding the bark and collecting the exudation which follows, and it is a very open question how far Nature will resent this, and how long she will refrain from some drastic protest in the shape of blights and diseases, due to the enervation and weakening of constitution inevitably involved. We may well bear in mind Gil Blas' account of Dr. Sangrado's method of treatment, under which all his patients died before they had time to get cured. Verbum sap sat.

MR. R. FOLEY HOBBS.

Mr. R. Foley Hobbs, of Thorneloe, Worcester, is one of the stalwarts in rose-growing circles. He has long been a member of the council of the National Rose Society, and for many years he has been one of the most successful competitors at leading rose shows. His first attempt as a competitor was at Gloucester, in 1895, on the occasion of the N.R.S. provincial show, when he was surprised and encouraged by winning a second and a third prize. At subsequent exhibitions Mr. Foley Hobbs won numerous prizes in the small growers' sections, and he has always endeavoured to stage blooms at the exhibitions of the parent society, but during recent years the Metropolitan Show has been held early, and his garden is a late one, so he has not been able to come forward at the great display. In 1901 Mr. Hobbs had a silver medal bloom of Her Majesty at the Inner Temple Gardens. and at the same place he won first prize for new roses in 1904, coming second in the same class in 1905, but winning firsts, also for new roses, at Gloucester in 1905, and at Edinburgh in 1906. In 1908 he won outright (three times in all) the silver challenge cup offered at Chipping Norton by Lady Algernon Gordon Lennox, turning the tables on Mr. Conway Jones, who held the cup the first year it was offered. In 1909 Mr. Hobbs secured the Ulverston challenge cup for the third time, and so won it outright, beating Rev. J. H. Pemberton and Mr. Park, of Bedale. Mr. Hobbs has won many other leading prizes for roses, and holds no fewer than twenty-five silver medals for "best blooms." In 1898 he became hon. local secretary to the N.R.S., at Worcester, and the efficient services he rendered and his enthusiasm as a grower and competitor secured for him a seat on the council in the following year, a position he fills most admirably.

Floral Tributes to the Late King's Memory.—The great love and esteem in which King Edward VII. was held by his people the world over has found expression in various ways during the past week, and one beautiful method of paying a last tribute to his many admirable qualities found its expression in flowers. Enormous numbers of wreaths and other floral designs, from all grades of society and from all parts of the Empire have been sent to Buckingham Palace and to Windsor Castle, and every tribute, no matter how simple and homely, has been recorded. White flowers have been the most largely used, liliums, arums, carnations, lily of the valley, eucharis, gardenias, and odontoglossums contributing the major portion, but coloured flowers have entered more extensively than usual into the floral tributes, and purple cattleyas and dendrobiums have supplied much of the colour, while scarlet pelargoniums, roses of various hues, carnations, and even yellow orchids have been largely utilised. Florists have excelled themselves in the design and execution of many of the more expensive and elaborate tributes, and it is not too much to say that nowhere and nowhen have flowers so beautifully expressed the deep sentiments of the senders as on this occasion. The Army has sent magnificent floral tributes to its late chief, those from the Royal Artillery and Royal Horse Guards being unusually handsome. It is impossible to detail the gifts or the givers but, large or small, lowly or costly, all were expressions of love for the departed and sympathy with the Royal mourners, and we know of no more beautiful way of expressing that love and sympathy than in flowers

National Rose Society.—At the meeting of the Council of the National Rose Society, held on Tuesday last, it was unanimously resolved to present an address of condolence to Queen Alexandra, who for many years has been the Royal Patroness of the Society.

Japan-British Exhibition.

Owing to the death of King Edward, this exhibition was opened on Saturday, the 14th inst., without ceremony of any kind, and the attendance of visitors on that day and the following Monday was such as to indicate wide-spread interest in the undertaking. The more important features, from the horticultural point of view, are the two Japanese gardens, which have been formed under the direction of a Japanese gardener possessing much constructive ability. Both are of interest, but the most attractive is that known as the Garden of Silence, and this is, in a measure, due to its higher finish and to its having been enclosed by scenic representations of mountains and forests of coniferous and other trees. These are well done, and, while adding to the effect as a whole, they prevent tall buildings in the neighbourhood obtruding on the scene. The other garden, which has received the designation of the Garden of Floating Islands, is of large extent, well designed,and eminently attractive, though a few finishing touches are necessary, especially in the case of the paths, and it requires rather more seclusion than has been found possible to give it to admit of its distinctive charms being seen to the best advantage. The flower beds in the central gardens are filled with summer flowers, the dominant colour being scarlet. In the Elite gardens Messrs. William Paul and Son, of Waltham Cross, and Messrs. Paul and Son, of Cheshunt, have rose gardens that should be immensely attractive in due course, and Messrs. Kelway and Son, of Langport, have arranged for a large display of their pyrethrums in the Colonial garden.

The Temple Show.—The exhibition which will be held by the Royal Horticultural Society in the gardens of the Inner Temple on Tuesday, Wednesday, and Thursday next, has the promise of being fully equal to the high average of recent years. The number of entries are larger than was the case last year, and a greater area of space has been applied for, but as an extension of the latter is impossible exhibitors will, as for some years past, have to be satisfied with an area considerably below their requirements. We shall give a full report, with numerous illustrations, of this great gathering in our next issue.

The Botanical Magazine for May contains a very fine double-page illustration of Cymbidium insigne, an exquisitely beautiful species from Annam; it was distributed under the name of C. Sanderi when imported by Messrs. Sander and Sons, but C. insigne is the correct name. We have frequently described this beautiful orchid. Other plants illustrated in this issue are Primula Forresti, a yellow-flowered species collected in Western China by Mr. Forrest; Nothofagus antarctica uliginosa, a South American beech that is hardy in most parts of England and Wales; Cornus florida rubra, a beautiful shrub with large rose-red petaloid bracts that expand in May, but, alas, it is not hardy except in highly favoured districts; and Acanthopanax Henryi, an interesting hardy shrub, five feet high, with five-lobed leaves, and small flowers, followed in autumn by rounded heads of black fruits.

Wild Flowers are somewhat sparingly represented at the Royal Academy, and the works in which they are treated with more or less success are of interest as showing how delightful are the effects that may be produced with their aid when the brush is handled by the artist who recognises the importance of so painting flowers that there is no difficulty in recognising them. Of commanding importance among works in which wild flowers are prominent, is Mr. J. MacWhirter's "Meadows and Mountains: Tyrol," which has for a foreground a glorious expanse of native flowers in which the brilliant blue Gentiana verna, the deep blue G. acaulis, white marguerites, and various yellow flowers predominate. Beyond these flowery meads rise lofty mountains that, enveloped in the deep blue haze characteristic of the Tyrolese as of other alpine districts, form a delightful background: "There is a quiet spirit in these woods," by Mr. Yeend King, represents this well-known artist in one of his happiest moods. It depicts a woodland scene, with the sun gleaming through the tender leafage, and the ground carpeted with bluebells. "Bluebells at Drewsteignton" is another study of these delightful woodland flowers, and in this the artist, Miss Mary Harding, has achieved much success. Mr. J. W. Waterhouse's "Spring spreads one green lap of flowers" is a work of great merit, in which anemones are admirably treated. "Silver and Gold" is a pleasing study of furze and hawthorn by Mr. F. Walters, and the "Scottish Highlands," by Mr. J. MacWhirter, must have mention for the charm of the wide expanse of heather, both composition and technique affording object-lessons of much value to the younger artists who give their attention to moorland scenery.

The Gardens of Leonardslee will be opened to the public on Thursday, May 26, by kind permission of Sir Edmund Loder, for the benefit of the West Sussex Benefit Nursing Association. We have on many occasions referred to and illustrated these beautiful gardens, and we are glad to give this notification of an excellent opportunity for inspecting them. The rhododendrons, and the water and alpine gardens will be at their best on the date given above. Admission will be 1s. from 2 p.m. to 6 p.m., and 6d. from 6 p.m. until 8 p.m.; admission to the museum will be 6d. extra, and tea will be provided at a small charge. The nearest station is Horsham.

Whit Monday was a beautifully fine day, and until late in the evening the weather was delightfully warm, but after sunset the east wind asserted itself, and the temperature fell considerably. However, it was a glorious day for those who spent the holiday out of doors, and, owing to the national mourning and the obsequies of the present week, fewer folk left the Metropolitan district, and therefore the open spaces in Greater London were all well filled. At Hampton Court the crowd was scarcely so large as usual; the Crystal Palace was well patronised, and 32,062 people visited the Zoological Gardens, an increase of 4,000 over the attendance on Whit Monday of 1909. There was a record attendance at the White City to see the new Japan-British Exhibition, and the Royal Gardens, Kew, were visited by no fewer than 152,000 people, or 50,000 more than on the previous similar holiday.

Progress of the East Anglian Horticultural Society.—The rise and progress of the East Anglian Horticultural Society, formerly known as the East Anglian Horticultural Club, is set out in figures in the neat little booklet containing the society's rules and arrangements for the current year. Twenty years ago the society concluded its first season with a membership of 89, total receipts £23 13s. 6d., balance 3s. 8½d. In 1900 there were 202 members, a total income of £62 5s. 8d., and a cash balance of £76 3s. 6d. At the conclusion of 1909 the membership stood at 337, the total receipts were £102 2s., and the cash balance £135 15s. 7d. In connection with its monthly meetings the society has given prizes ever since 1893, the sum amounting to £32 2s. last year, as compared with £2 10s. in 1893. In no year has there been a balance on the wrong side, and the fluctuations of the cash balance all through have been very small. It is worth noticing that the society has its own Benevolent Fund, from which it makes grants to members in distress.

Distribution of Oxalis cernua.

According to the Rev. Professor George Henslow, Oxalis cernua provides one of the most striking instances of plant dispersion. He stated recently before the Royal

Horticultural Society that this little plant, a native only of South Africa, has now spread to the Bermudas, to the Canary Islands, to Madeira, Malta, and the Mediterranean coast. At Malta the plant has become ubiquitous, taking possession of walls, roadsides, etc., and adapting itself generally to varying circumstances.

Finsbury Square Garden.—With reference to the conversion of this interesting garden into a public open space the "City Press" remarks: "At the end of May, or the beginning of June at latest, the pretty little garden which occupies the centre of Finsbury Square will pass from the possession of the owners and occupiers of that once delightful residential quarter. Thenceforward the garden will be free to the public, and the London County Council will be responsible for its upkeep. The changed character of the square, which is now almost entirely devoted to the offices of business firms, has rendered the change possible, and the Ecclesiastical Commissioners saw the opportunity of giving to London yet another open space in a crowded and busy district. It is perhaps unfortunate that the Commissioners do not know their London better. Did they know it the Corporation might have been asked to accept charge of the garden, and by that means no cost would have fallen upon the ratepayers. However, it matters little which body has charge so long as the public obtain the ground. It is interesting to note in passing that as far back as 1874 the Corporation passed a resolution declaring that every effort should be made to secure and preserve all open spaces in the City. The matter was referred to the Coal and Corn and Finance Committee, with a request to see whether public admission could be secured to the gardens of Trinity Square and Finsbury Circus, and the enclosed ground round St. Paul's. That was practically the beginning of a movement which has proved so beneficial to the workers of the City and its neighbourhood."

Kew Guild Annual Meeting.—We are requested to state that the annual general meeting of the Kew Guild will be held in the Gymnasium, near Kew Gardens Station, Kew, at 7.30 p.m. on Monday, May 23, and that a reunion will take place after the meeting in the large room at the Kew Gardens Hotel. It is hoped that there will be a large attendance of past and present Kewites.

Mr. F. V. Theobald, of the South-Eastern College, Wye, whose work in connection with economic entomology is well known, has been awarded the Grande Médaille de St. Hilaire by the Acclimatisation Society of France in recognition of the value of the service he has rendered by his investigations in connection with insects injurious to garden and farm crops.

The Gardeners' Company has presented a memorial to the Corporation of the City of London, asking them to recognise the company's ancient livery with an unlimited number in accordance with the powers conferred by the Constitution of [illegible], or alternatively to grant an increase of the livery. The company also ask for a grant of higher precedence than that at present conceded.

A New Possible Source of Rubber.—An inferior form of rubber has been produced for a long time past in Little Namaqualand, and it has now been determined that Euphorbia elastica is the plant from which it is gathered. As this plant is plentiful in the deserts, there is a possibility some brilliant financier may make money out of the barren areas of Namaqualand.

AMONG THE ALPINE FLOWERS.

> "And now the young and flowery-kirtled May,
> Decks the green hedge and dewy grass unshorn,
> With cowslips pale and many a whitening
> thorn."
>
> —Bamfylde.

A month of flowers indeed is May, and the lover of alpines culls many a pleasure from the endless array of blossoms which appear to his admiring eyes. Flowers in plenty, accompanied with foliage of the most beautiful hues, meet him at every turn. It is difficult to wander among the alpine flowers at this time without feeling that the riches are indeed embarrassing and cause one to doubt which to select for notice at the present time. One must, however, attempt the solution.

Anemone ranunculoides fl. pl.

Among the scarcer flowers of the time is the double variety of Anemone ranunculoides, an old plant which has recently become available to the lover of the anemone once more. It came into bloom in April, but has lingered in the lap of May, and as this is written is just passing off in the open, and in one of the places it loves—a shady one, where it is screened from the sun by a hedge, but receives plenty of air as well. Like the other forms of this windflower, it is also at home under trees. This double variety is an old plant better known in former times than for some time past. The flowers are of a good yellow, and are not full double, but are in reality semi-double. But this partial doubling gives the blooms not only a different appearance from its sisters, but also has the quality of rendering them more lasting, a merit of some importance with spring flowers. It is more desirable than the single typical form, although not better than the paler yellow variety, called A. ranunculoides pallida. It was with pleasure that I observed this double anemone offered for sale, and I lost no time in securing it for my garden, with the satisfaction of being pleased with it when it bloomed. Planted in September or October, about an inch deep, it flowers well the following season if good tubers are secured at the time of purchase.

Arabis Sturi.

The arabises or rock cresses are not so much valued as they would be were they less common, although few of them can rank among the élite of alpine flowers. In Arabis Sturi we have one of less effect than the more common A. albida or A. alpina, but it is less aggressive in its ways and forms a neat little carpet of foliage, which, in late April and early May, is almost covered with spikes of small white flowers. The whole height of the plant is only three or four inches, and nowhere does it look better than on a flat portion of the rock garden, a good bit below the level of the eye. To see it at its best it should, I think, be looked down upon, although on a slight slope a little higher it would probably be pleasing also. I grow it in a gritty soil, and it is thoroughly hardy and requires little or no attention beyond a slight top dressing among the foliage in spring and autumn.

I am glad to find that Mr. Reginald Farrer, with whom I am not always in agreement, likes this little rock cress. He remarks of it in his "Alpine and Bog Plants," that it "is an uninvited guest here, and is still welcome. He came in something else, and has now made himself quite at home, a neat-habited, rosetty thing, with heads of white blossom." It is said to be a garden plant, raised or introduced in 1897, but I can find little information about it anywhere. One would think that there is some of the blepharophylla "blood" in it, with some of that of A. lucida also; but this is mere conjecture.

Viola gracilis.

So much has been written about this pretty violet that there is but little to say regarding it which can be new. It is, however, mainly for the purpose of recommending it that it is mentioned now. It is in bloom in the open, and its pleasing, good-sized dark blue flowers are highly attractive, while the plant is such a good doer that it is likely to become highly popular. In old days it would have been highly valued as a bedding plant, and as a rock plant, or one for the herbaceous border, this little flower is extremely valuable. It forms a nice tuft of leaves with plenty of the dark blue flowers well raised above the foliage. This viola comes from Greece, and is thoroughly hardy with us. It is very easily cultivated in a loamy soil.

Viola Craven Gem.

The mention of V. gracilis reminds one of a new viola which has come under my notice, and is likely to become a most useful plant either on the rockery or in the border. It is a direct descendant of the wondrously free-blooming Viola papilio, one of the most valuable of the race we have had brought to our gardens for many years. V. Craven Gem originated in a garden in which V. papilio has shown a decided tendency to sport from seeds, and V. Craven Gem is one of the results of this departure from the parental characters. It has, however, larger flowers, which are more of an uniform bright blue than are those of the parent. They are also of better form, although preserving a good deal of the informality of papilio. V. Craven Gem shares, however, the floriferousness which is one of the distinguishing features of the papilio viola, and which makes it an almost perpetual bloomer. In warm gardens there are few months in the year in which it is impossible to see flowers of V. papilio.

Other Flowers.

There are now many other flowers on the slopes and overhanging stones of the rock garden, and one's tale would be long indeed were one but to attempt to specify them and their beauties. Aubrietias are aglow with colour. Alyssums give their gold-dust-like flowers or their small white blossoms, as the case may be. There are snow-white sheets of arabises, with rivalling iberises. There are wood anemones, in white, single, semi-double, and double. We have them in opal, pale blue, and deep blue. Primulas, with allied polyanthuses, auriculas, cowslips, oxlips, and forms of single and double primroses brighten many a corner. Saxifrages adorn many places, brightening them with sheets of white or pink, or sending up spikes of little lace-like blooms. Spring phloxes gladden our sight with their sheets of colour. Such early brooms as Cytisus Kewensis show their lovely flowers, and narcissi nod still from the rock gardens where they are grown. Muscaris and late scillas are gay with their intense colouring, and everywhere we look there are little patches or big masses of the various colours of the floral gamut. Truly the rock garden is beautiful just now, countless treasures appealing to us as we look them through. It is not easy to observe everything, and it is more difficult still to give a faint impression of the variety of the charms they afford us now.

S. Arnott.

FRAME CULTURE OF CUCUMBERS.

Most people who possess a cold frame have, I think, at some period or another attempted the cultivation of cucumbers, and it occurred to me that a few remarks and cultural details might not be out of place concerning the practice, for not only does the cottager (i.e., if he prefers his own produce) have to rely on this method of procedure, but it is also common practice in gardens of large dimensions to augment the supply of this popular vegetable through the warmer months of the year by growing some plants in frames or pots. With reasonable attention, a good crop of fine quality can be obtained.

Whether the frames are heated or not, it is essential that the growth of the plants receive additional impetus by the use of a hotbed of fermenting material. For early supplies a flow and return pipe in a pit does much to promote growth, and also protect the frames at night from late spring frosts; but it is not an absolute necessity if a good hotbed is formed. To ensure a free growth, and only by this can the fruits be expected to mature quickly, and possess those succulent qualities so highly esteemed, it is essential to form a hotbed of long strawy stable litter and leaves. This should be in the proportion of one of the former to three of the latter. The freshest leaves that can be obtained should be used, and for preference oak or beech. The material should be got together, mixed, and turned about several times before being put in position.

The size of the bed must depend upon the dimensions of the frame, allowing a margin of two to three feet all round. Build the hotbed firmly, or the frame will present a sad appearance in the course of a few weeks. Place the frame in position, but do not hurry to plant out until the bed has settled down and the heat is just on the decline. Avoid using too much soil at the time of planting as it is only liable to become sour, and by far the best practice is to add to the bed as required, which is when the tiny white roots appear on the surface seeking nourishment. Therefore, at the time of planting a small quantity of soil is required, just sufficient to cover the ball of roots. This must, of course, be placed in position prior to planting, so that it may become warmed to the same temperature as the frame. Many and various are the mixtures advocated and used for the growth of cucumbers, but I prefer a loam for the staple part, and leaf-mould, which must be mixed in proportion according to the nature of the loam, with a sprinkling of fine charcoal and a little sharp road grit.

The plants should be sturdy at the time of planting, and have been grown near to the glass, and require putting out when the pot has become filled with roots, and before a pot-bound stage is reached. If the plants are growing freely and are likely to become starved, it is far better to give them a shift than allow them to remain in that condition if it is not convenient to plant them out. Planting should be done as quickly as possible, and when the weather is warmest, having first thoroughly hardened off the plants. Two placed in each light will be ample to cover the space, if one is taken towards the top, and the other trained to cover the lower half. The soil should not be allowed to become dry, but caution is necessary against over-watering, and until growth is active promote a moist atmosphere by repeated syringings whenever the weather is bright. Air must be admitted early in the mornings, but cautiously if the weather be bright, as cold winds often then prevail. Close the frame early in the afternoon to take advantage of any sun heat that may follow.

The growths should be thinned and pegged down occasionally, always attending to these details towards the middle of the day or when the weather is warm. Apply top-dressings and keep the plants well watered when in full growth, both with clear and occasional doses of properly diluted liquid manure. Remove old foliage and any leaves that touch the glass. Keep the glass thoroughly clean both inside and out, and cover up each night with mats or other protecting material whenever the weather is cold. Never allow the fruit to remain on the plants after they are large enough to cut, nor overtax the plants with too many fruits.

There are many varieties eminently suitable, but I have found Ideal and Lockie's Perfection excellent for this purpose.

Aldenham Gardens. **E. Beckett,**

A PLEA FOR MALMAISON CARNATIONS.

The Malmaison carnation is indeed the flower of fashion, one which is never out of place or season, whose massive beauty and enchanting colours lend refinement and dignity to its surroundings.

During recent years, since the advent of the perpetual carnation, we have been repeatedly told that the death knell of the Malmaison has been sounded, and all that remained to us who admire the plant was to prepare for a decently respectable funeral. This, however, has not yet taken place, and while I admit that the perpetual is the greatest of all carnations, yet the Malmaison will always hold its position amongst people of good taste. Both classes of carnations can be beautiful, and should be admired for their respective charms, and the success of one should not be measured by the shortcomings of the other.

The fundamental principles of the cultivation of the Malmaison are in our day more fully understood, so that there never was a time when Malmaisons were brought to greater perfection or made to bloom over a longer period, and now that we understand the essentials in the culture of this plant, the thoughtful and intelligent gardener has little difficulty in achieving success.

The main points are undoubtedly the following: Good, clean, healthy stock to start with. The layers potted up in good time so as to receive their second potting and become well established before the winter months. During the dull season allow the plants to rest, cool, dry, airy conditions being the most favourable to the plant during this period, and undoubtedly it is the winter treatment wherein lies the secret of Malmaison culture. Many most excellent results are obtained from plants wintered in frames, with just sufficient heat to dry the air. This, with little water and much ventilating gives the necessary conditions. But what a contrast to the spring season, when the Malmaison rushes away into a vigorous, robust growth, and calls for much water and food. Then the air should also be charged with a certain amount of moisture. The Malmaison must be shaded from the strongest sun during late spring and early summer, or the blooms will suffer in size and colour; but let this be the golden rule in Malmaison growing—never have all the ventilators completely closed.

It will be seen from these few remarks how many more of our gardeners than those who do could grow Malmaisons, which are the most highly appreciated of flowers. In fact, many gardeners do succeed with only a frame, and a house to flower them in.

No special society fosters a love for this carnation, and few could even give a correct definition of what a Malmaison variety really is. The fact, however, that its season of flowering is during Society's height of activity, and that it is highly prized by them, is a great power in its favour. You may drag it, and indeed we know it too often is dragged, in the gutter, yet, even this has not made it common or lessened its dignity.

The main object which I have in view is to draw attention to many of the more recent varieties of Malmaisons, which undoubtedly are far superior to the old varieties, and which are not taken sufficient account of. This may be owing to the fact that in times past several very indifferent varieties have been put upon the market. This has led people to think nothing better than Princess of Wales, Old Blush, etc., could be expected, but if some of the newer kinds were taken up seriously, and the public saw more of them, their good qualities would become recognised.

Maggie Nettlefield is a most striking Malmaison, larger than Old Blush and of very similar habit of growth. The flowers are flesh-pink marbled or veined red; Lady Coventry has been well shown, and is undoubtedly an improvement on the older varieties of that peculiar shade of salmon-cerise colour; Irene is very similar to, and by many preferred to Princess of Wales. The Colonel is a gigantic cherry red, with a sound calyx and strong, erect stem, which has been described by one large private grower as "the perfect Malmaison." Since the dissemination of "Yaller Gal" and "The Queen," which were no doubt most excellent in their day, there has been great progress made; and compare these two varieties with C. P. Little and Lady Mary Hope, and the development of the Malmaison is most marked.

While the Malmaison varieties have a very bright future before them, Marmion has paved the way for better things, which are rapidly following, and shortly we may expect to see nearly every shade of colour represented in this new section of Malmaison perpetuals.

Montagu C. Allwood.

DEUTZIA GRACILIS.

Many inexperienced cultivators either throw away their forced plants directly the flowers on them have faded, or been used, or allow them to lie about in a neglected state until they are practically useless. About twenty years ago I saw some grand plants in a garden in Warwickshire. They were growing in deep loam in a sheltered spot, and looked like rows of gooseberry bushes from a distance; they were exceptionally healthy. I then took charge of some gardens in the south, and, as much forcing was done, I determined to take care of my deutzia plants, as flowering shrubs were much appreciated.

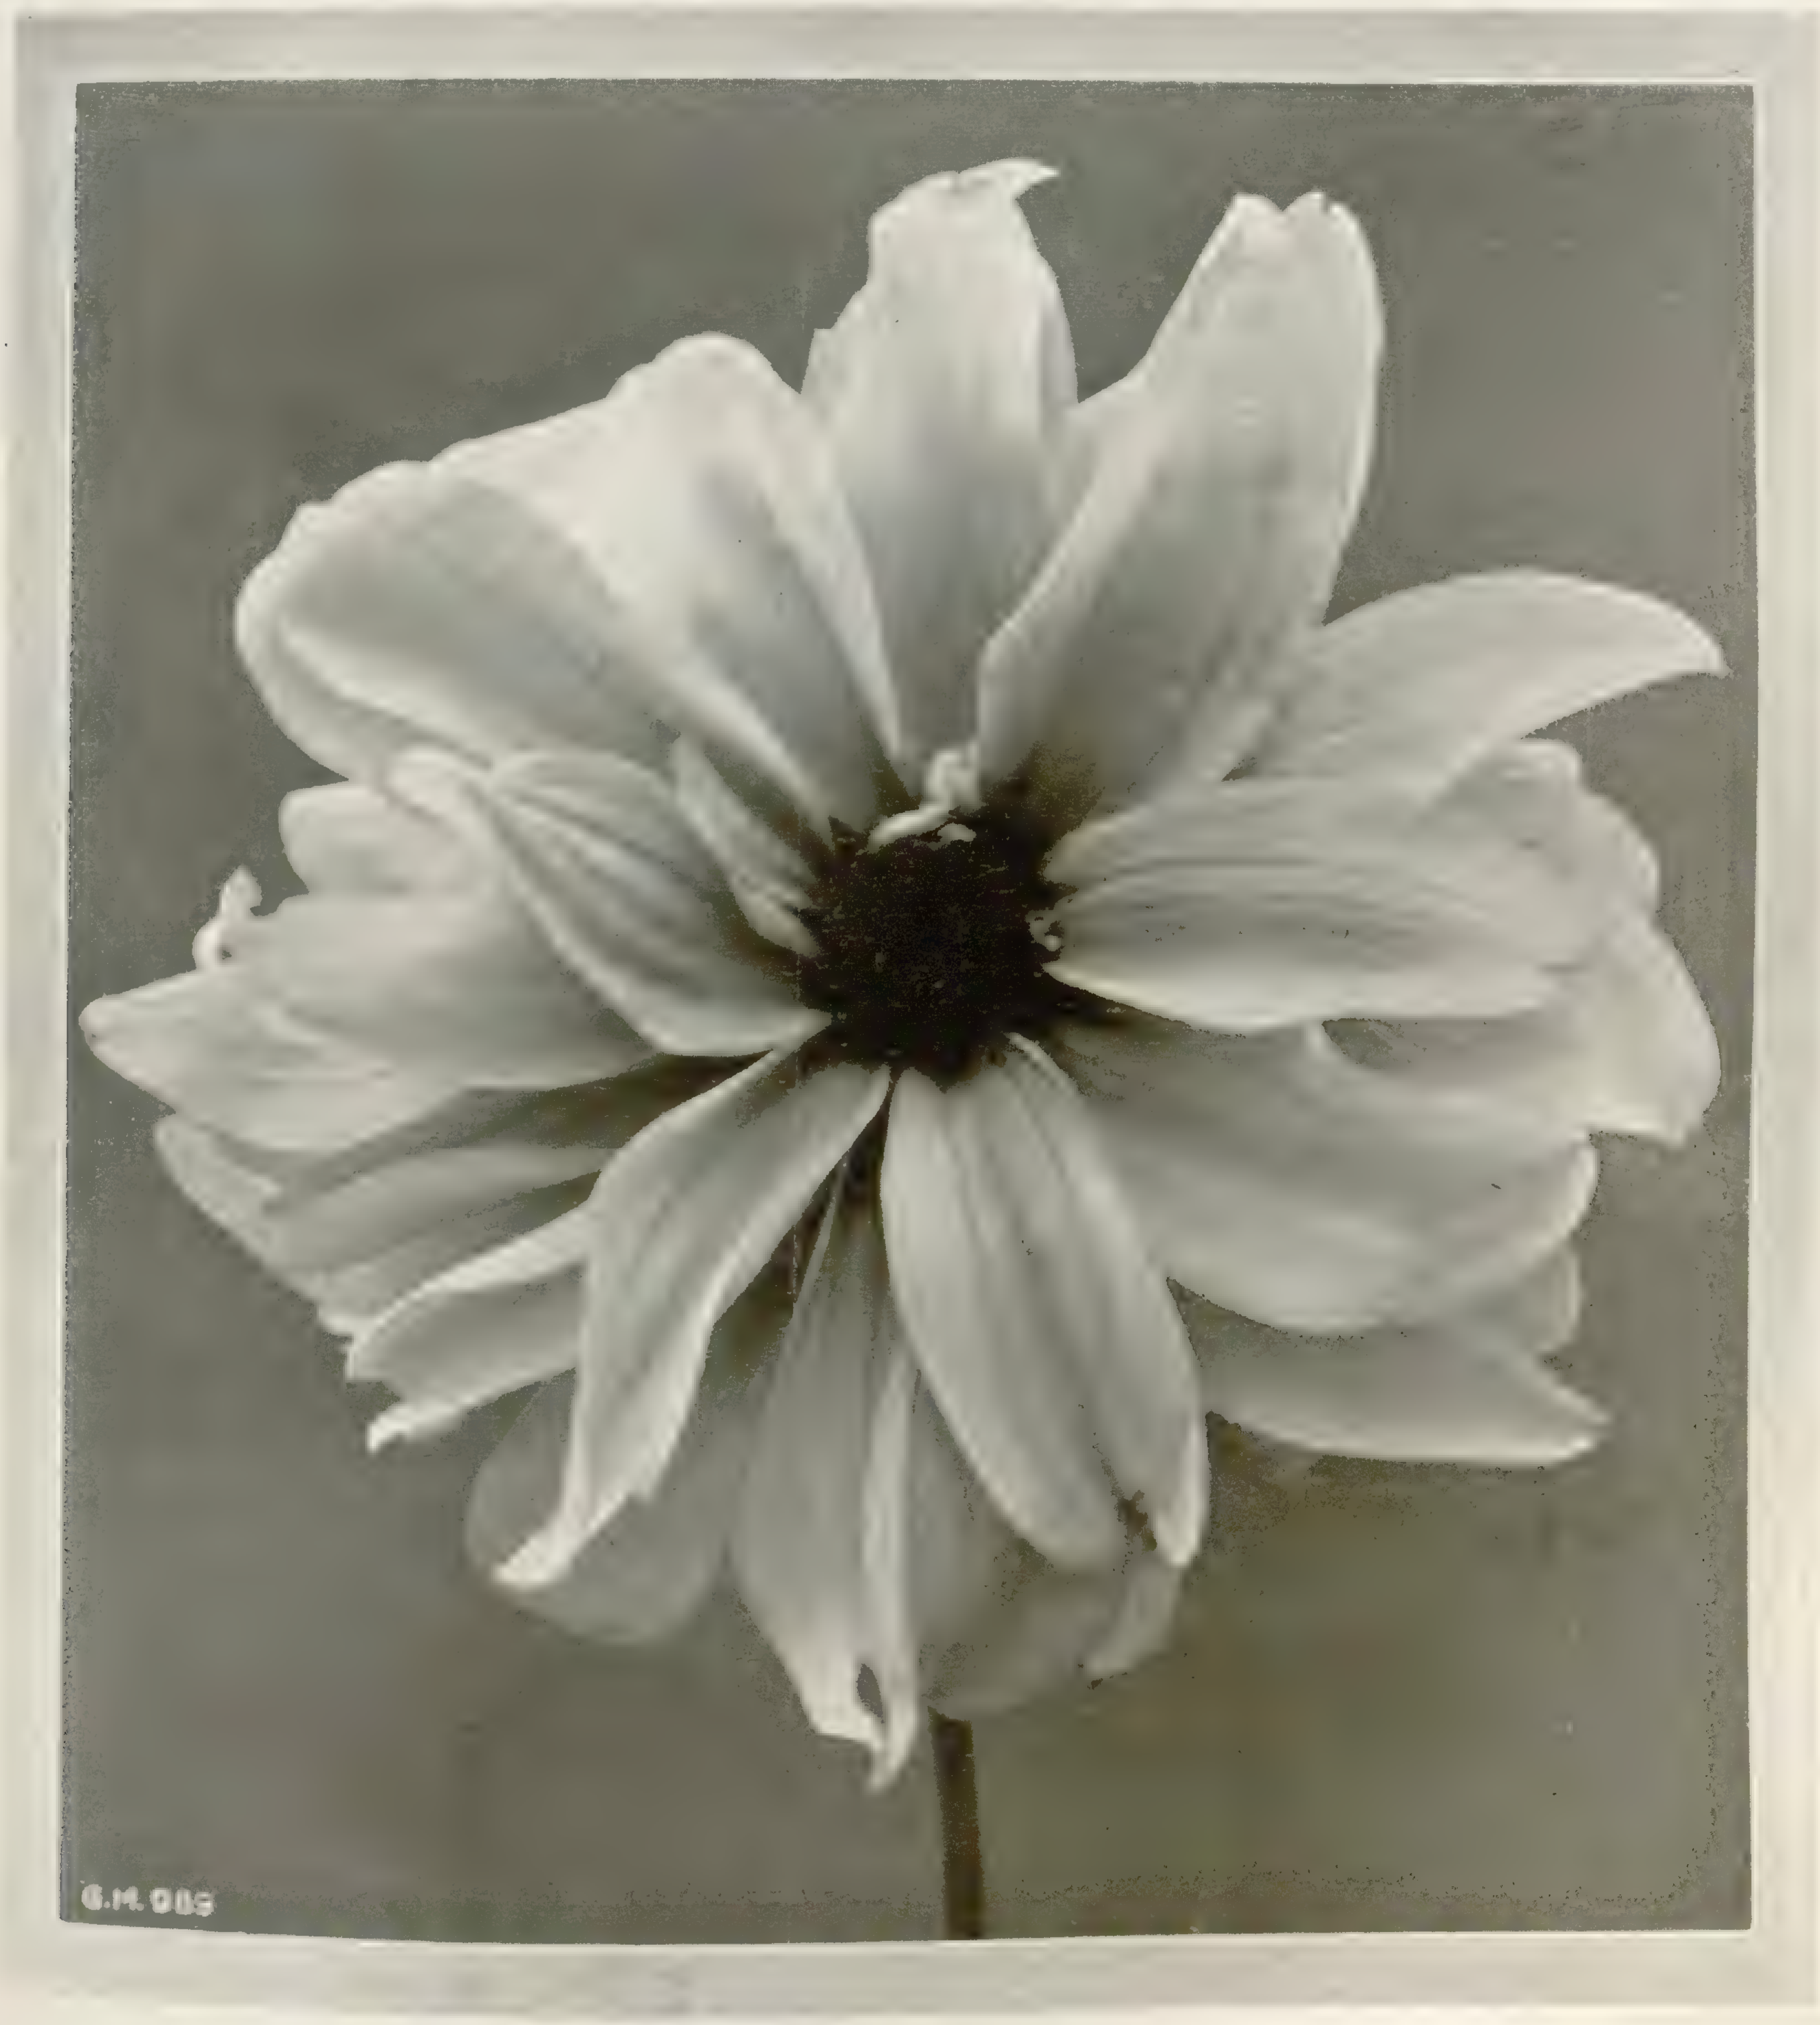
Directly the flowers on the forced plants were used, or had faded, I placed the latter in a frame and had them well cared for; they were duly watered and syringed; old wood being cut away. In the meantime a very warm position in the kitchen garden was selected, trenched, and manured, then they were put out a good distance apart, watered, and heavily mulched. Result: The young shoots made strong growth, which doses of liquid manure improved later in the summer. By the end of autumn finer plants were available than before forcing commenced, and at the end of two years they were fit for forcing again.

G. B.

NEW PÆONY-FLOWERED DAHLIAS.

Mr. J. T. West, of Brentwood, who for so many years has been a very successful grower and raiser of dahlias, and has given the horticultural world many fine cactus varieties, and a delightful series of the little pompon dahlias, would seem to about the last man to enter seriously the work of raising the giant-flowered informal pæony-flowered varieties. Neatness has always been a character developed Mr. West's flowers, and yet he has his attention to the new section, a tion that sets at nought the old florists' and regulations. But in this direction Mr. West has at once ed success, as he has in the cactus and groups. It occurred to him that Dutch friends had originated flowered dahlias, that was no good why the section should be left enly in their hands, and so, understandtendency toward and the need for, for garden decoration, he set about the business of raising new varieties with his usual energy and determination. His chief aim was to introduce new colours, and in this he has been particularly successful, and he has named several of those varieties he has selected for distribution after celebrated painters.

The new varieties that came under our notice last auutmn, and were well shown by Mr. J. T. West on several occasions, are: Burne Jones, with broad rosy-lilac petals and fine golden centre; Dormouse, rich velvety crimson; Lord Milner, yellow edged with white; Norah Lindsay, dove-colour, suffused with pink; Rubens, rose-pink, flushed with salmon; Liberty, brilliant scarlet; Ruskin, pink and crimson, very bright; Turner, rich pink (see illustration); and Titian, bright red. These are from four feet to five feet high, with Rubens somewhat taller than the rest.



G.M. 989

NEW PÆONY-FLOWERED DAHLIA TURNER.
Flowers rich pink; raised by Mr. J. T. West, Brentwood.

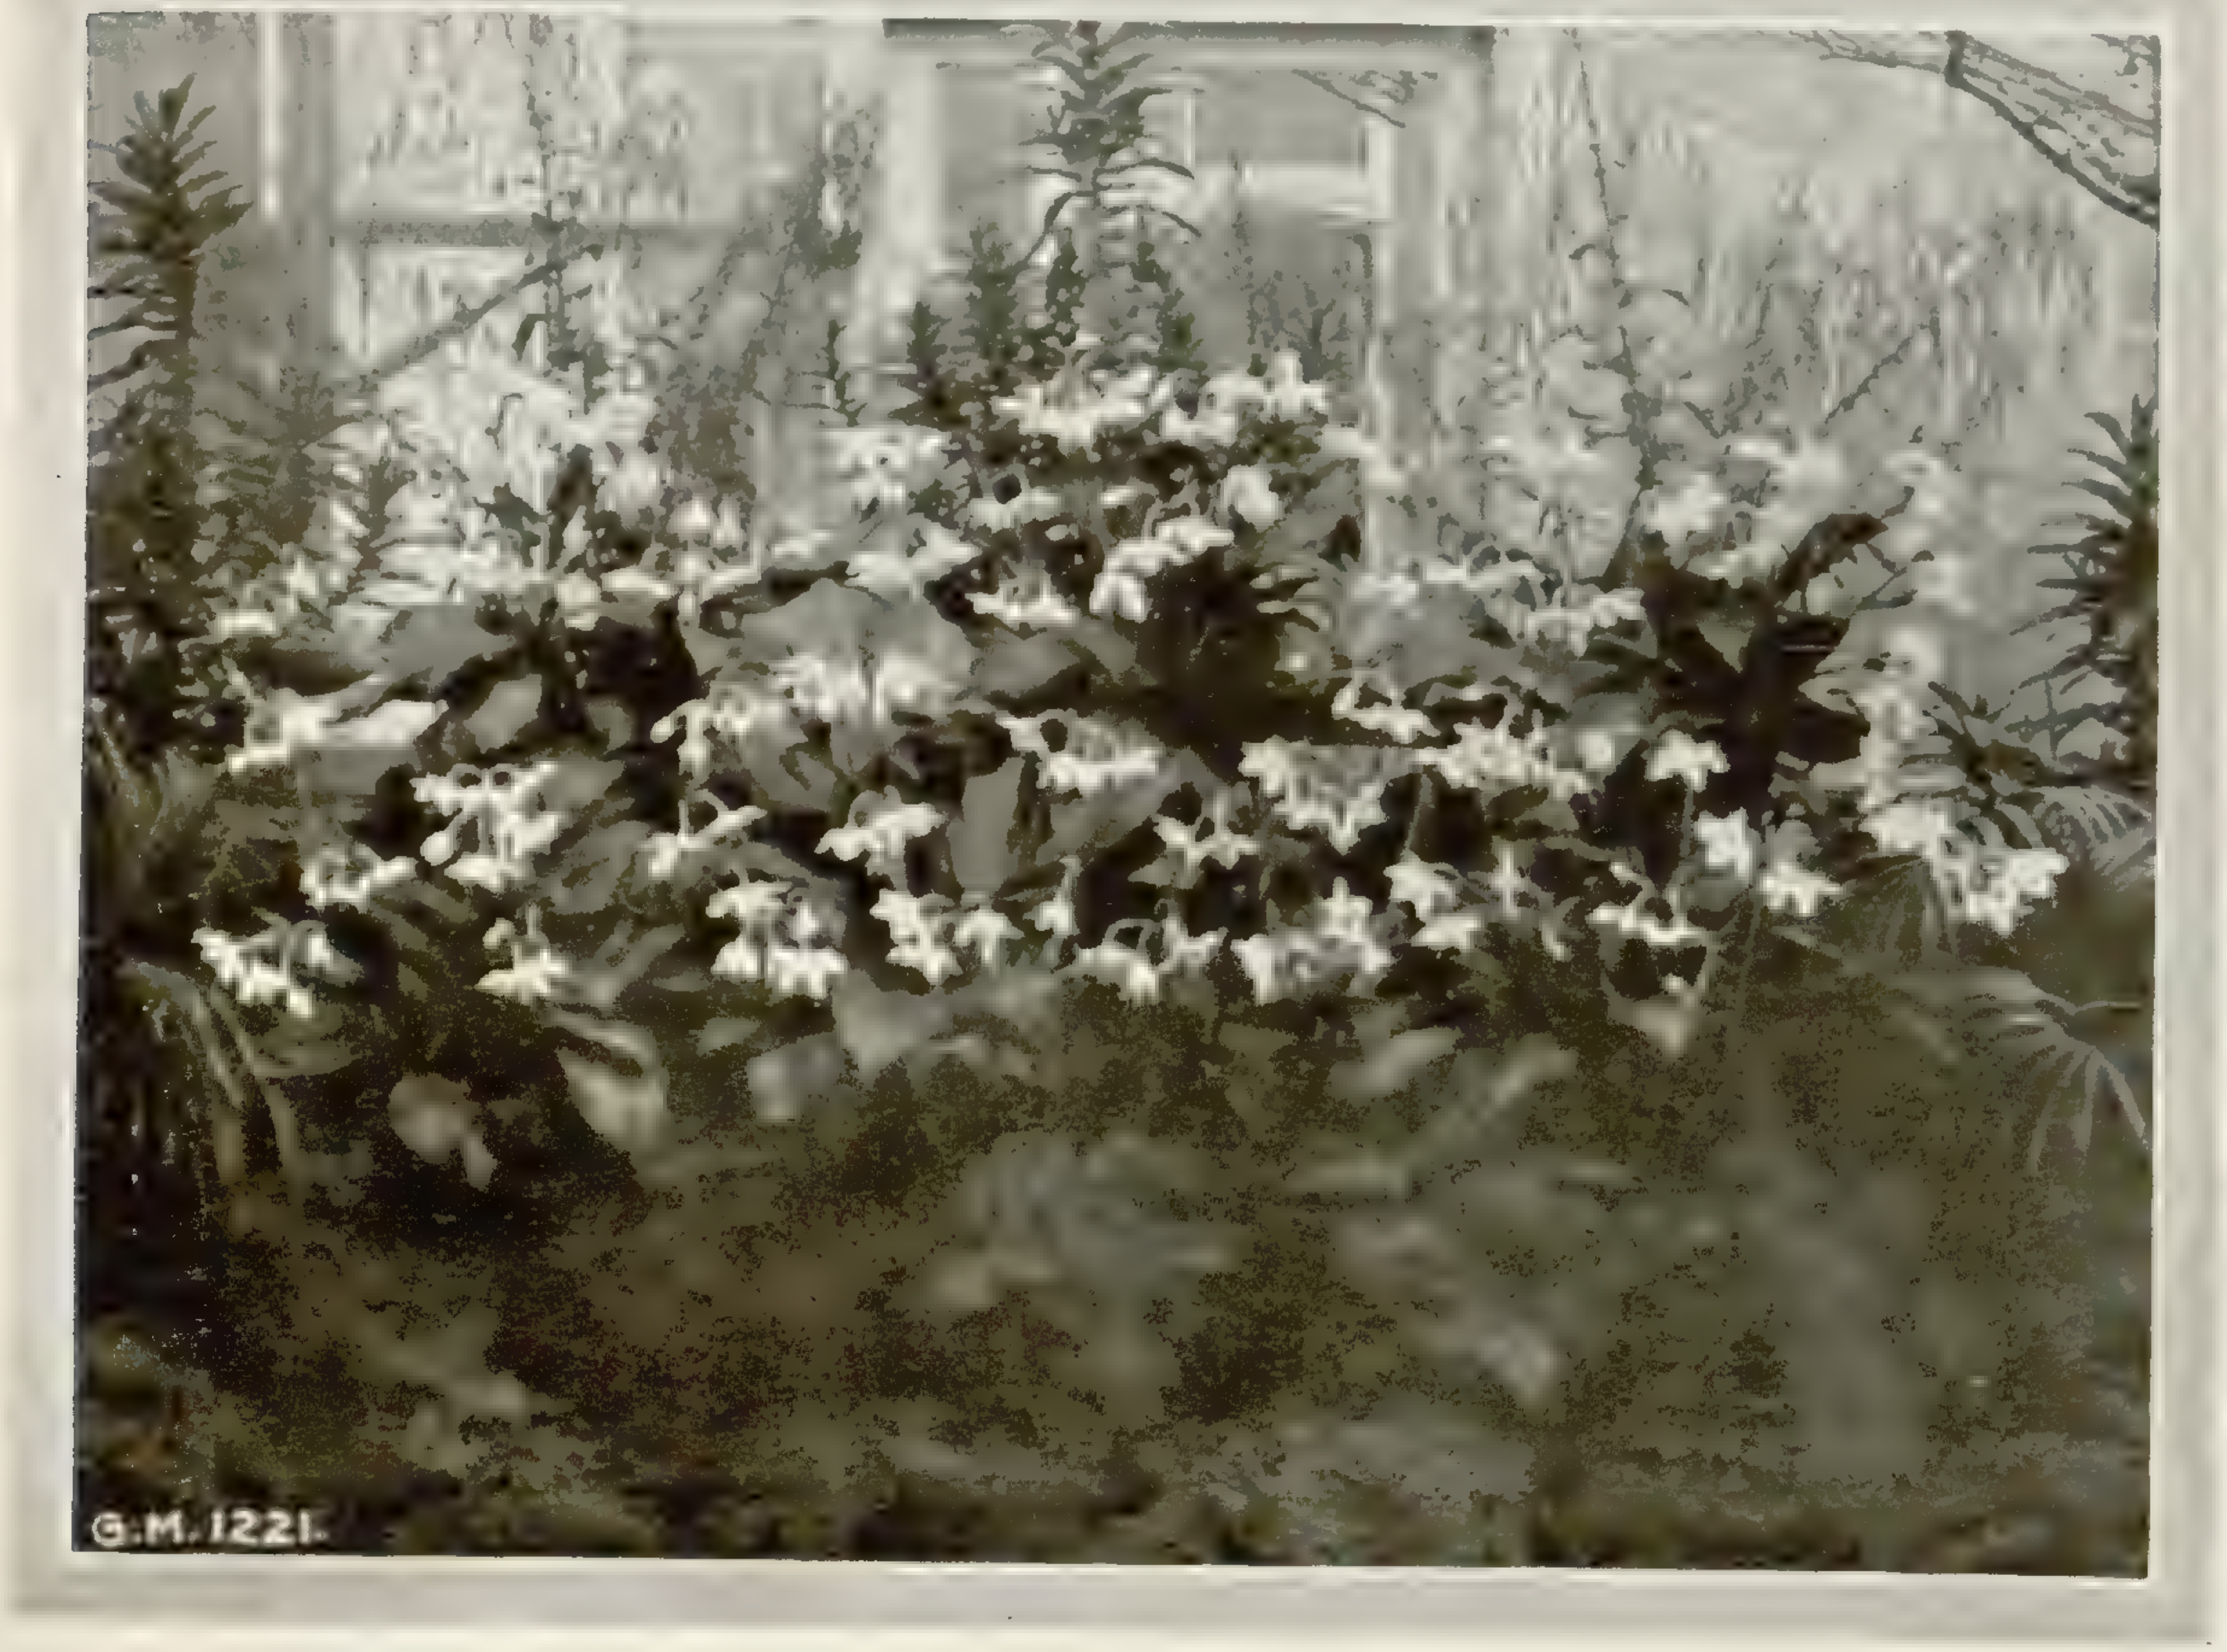
DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

ROSE NOTES.

For the last six years Blush Rambler has been one of the most showy and pleasing roses I have grown. In growth it somewhat resembles Crimson Rambler, but is stiffer and has more thorns. I have it on pillars, arches, and at intervals upon a pergola, and in either situation it is beautiful. The flowers last longer than those of most of the Ramblers, both upon the plant and when cut. The very large pyramidal trusses of blush pink strongly remind one of clear apple blossoms, but are much larger, and of course not so fugitive. The rose has a peculiar and pleasing perfume and is very hardy. I prefer it to the Penzance briars for a high and stiff hedge, and it lasts much longer in flower, while the foliage is clean and sound all through the season. It does not mildew with me, although frequently Crimson Rambler growing by its side has been severely attacked. I like to see the two together, the contrast being so marked. It is also a Gold Medal rose.

Electra is one of the very earliest flowering roses, and a good pillar variety. Somewhat like Aglaia in colour, it is deeper in the bud stage, when it is golden lemon shaded with orange. As the flower opens it passes from pale primrose to almost white. This variety flowers in clusters and lasts some time, and it does best when the flowered growths are cut out each season, and young rods encouraged. In this respect it differs entirely from Aglaia, a variety that is very impatient of the knife, and often condemned when the fault really lies in the pruning.

Florence Edith Coulthwaite and Mrs. David Jardine have been pleasing under glass this spring. Both have succeeded better in pots with me than in the open. The first-named is orange and peach, with peculiar stippling of clear rose on the inside of the petals, which renders it one of the most distinct roses grown. It is of good imbricated form and long lasting. Mrs. David Jardine was introduced during the same year, and is one of the best for forcing where a bright rosy pink flower is required. This rose scarcely produces a blind or flowerless shoot with me, and is very floriferous.



WELL-GROWN EUCHARIS AT BOTLEY HILL GARDENS, HANTS.

Grace Molyneux is another new rose that is forcing well. It blooms freely, and the buds are almost as long as those of Betty, with the same large petals, creamy-apricot with flesh centre, and very sweetly scented. It was also good outdoors last summer. Herman Cœnemann, a very large and pale pure pink, promises well for exhibition, and last year it was exceptionally showy in the open. Herzog Friedrich II. von Anhalt is a very peculiarly coloured rose; salmon, shaded with carmine, coppery-red and cinnamon in the centre. It is of good size and shape, and very fragrant.

Helen Good is a sport from Maman Cochet, a very delicate pink with deeper edges. This must not be confused with Helen Gould, which is a cross between Kaiserin Augusta Victoria and Caroline Testout. Helen Gould with us is too much like Baldwin to show any appreciable difference except in an occasional flower.

Friedrichsruhe (1908) is one of the best dark blood-red H. Tea varieties, and one that will certainly become popular, as it adds depth of colour to this class. It is of good habit, and we find it flowers very freely, not in a mass as in some roses, but continuously. Some growers catalogue this as a Tea, and it certainly favours that class more than many of the hybrids.

Jacques Vincent, a new H. Tea from Soupert and Notting last year, will probably be a good forcing rose, if one may judge of its behaviour this spring. It is unique in colour, coral-red, shaded with yellow, and with a rosy-salmon centre. The long, well-formed buds open into a very large and perfectly shaped flower. The combination of colours is very attractive, and it is one of the freest bloomers; has a vigorous upright habit of growth, and, as seen so far, is one of the most promising new Continental roses. A. Piper.

PLANTING OUT VIOLETS.

Violets intended for culture in frames next winter should be put out as soon as possible. They often do remarkably well in single rows right in the centre, or open part of the kitchen garden. The clumps should be planted quite 2ft. apart, and all runners that show during the summer months must be pinched directly they are large enough to handle, and red spider must not be allowed to infest the leaves. One clump so grown is worth half a dozen (for frame culture) of those grown in an over-crowded state on a hot south border.

I remember seeing some tiny plants on such a border last August; well! I had to look very closely to see them at all. It was pure waste of time and space to so treat the plants; they were nearly devoured by red spider. The soil in which good clumps are to be grown should be made firm while in a fit state before any planting is done. A compact clump will result, but the ground must not be unduly trampled upon afterwards. I believe I was one of the very few who, on its introduction, successfully cultivated that grand single violet Princess of Wales in this country. It is a splendid variety for growing near, and in, towns, as it resists fogs so well.

Geo. Garner.

EUCHARIS AMAZONICA.

The photograph I am sending you shows a group of seven specimens of the beautiful and useful Eucharis amazonica, as they were on January 22 last. The specimens carried from ten to thirteen spikes each, and yet it is more than ten years since either one of them was repotted. They flower three times every year, and my neighbours are good enough to say that such healthy and free-flowering examples have never been seen by them anywhere.

Weak liquid manure and soot water are given occasionally, and under no circumstances are the roots allowed to become dry. The stove or the cucumber-house provide the plants with a suitable position and temperature, and they are never placed in a cool house to rest. Beyond these points of culture, and scrupulous cleanliness, we do not follow any special system of management.

W. Davey,
Gardener to Lady Jenkyns.
Botley Hill Gardens.

CLEMATIS MONTANA RUBENS.

The old well-known Himalayan Clematis montana is one of the most effective plants imaginable when covered towards the end of May with its showy white flowers, and in many a garden it is found covering the fronts of houses, low walls, pergolas, and other supports, where it rarely fails to bear a profusion of blossoms. The variety under notice has, however, only been available for garden decoration during the last few years, for it was only introduced during the first year or two of the present century. It has, however, made rapid headway, and plants are found in many gardens, though really large examples are still scarce.

It was sent home from China to Messrs. Veitch by Mr. Wilson during the time of his earliest visit to China, and was one of the first shrubby plants of his collection to be put on the market. It has much in common with the type, being quite as good a grower and quite as free, but the leaves are very much darker in colour, the stems reddish, and the flowers deeply flushed with red. Two forms appear to be present, the flowers of one being much larger than those of the other. The blooms of the smallest one are similar in size to those of the type. It is a suitable plant either for growing against a wall, pergola, or group of rough stakes in the open ground. At Kew a fine example may be seen in the clematis collection, covering a support of rough branches. This has occupied its present position for the last four or five years, and has blossomed well each year. W. D.

Rose Climbing Devoniensis.—This old variety is not now much planted, and perhaps for this reason is more appreciated when seen in good condition. It has an uncontrollable habit of throwing up strong, stout growths from the base of the plants, consequently when selecting a position for planting it this should be taken into consideration. These vigorous growths quickly cover much space, and from the lateral growths good blooms may be cut. Probably the finest specimen of this rose is to be seen in the conservatory at Courtlands, where it was planted some eighteen years ago, and now covers a space of 44 feet by 12 feet. The fine flowers the plant produces might lead one to think it was a special variety of this rose, but its vigour is probably due to the roots having found something suitable to their requirements in the border.—T. H. Slade.

DUNDEE RAMBLER ROSE.

All the lists of roses are agreed on about four points concerning the popular rose named Dundee Rambler. First of all, the title is given, and then the section to which the variety belongs is invariably given as the Ayrshire. That it is a robust climber is generally stated, and also that the raiser or distributor was named Martin. Respecting the date of introduction, all the lists are silent; while concerning the colour of the flowers, descriptions vary from white to blush and pink. One would like to know something about the man who is credited with being the raiser of Dundee Rambler, while an approximate date of introduction would add to the interest. But this knowledge would not make the rose more beautiful or useful, nor would it help us to cultivate it better. Fortunately, it is one of those roses that asks for very little from the cultivator, and, notwithstanding that it has been long with us, it still holds its own among the hosts of rambling roses introduced during recent years. The annual removal of a certain amount of old wood that has ceased to be productive of flowers, or of stout growths that are crowded, is necessary, and of equal importance is an annual top-dressing of half-decayed manure. On several occasions attention has been drawn to the value of this grand old rose in these columns, and illustrations of its usefulness set forth. In the present issue a further illustration of Dundee Rambler is given, showing the rose filling an otherwise unsightly corner.

P. P.

TREE ROOTS.

At the back of my house, in the field beyond the end of a garden eighty feet long, and therefore fully ninety feet distant, there is a row of sturdy elm trees, and close to the house, and therefore fully eighty feet from the trees, elm suckers persistently assert themselves. The trees I estimate to be about 80 feet high, and are fairly fine specimens. The presence of these suckers is absolute evidence that the roots of those elms extend for 80 feet in the direction of the house, and, assuming a similar extension in all directions, we have a root system of no less than 160 feet in diameter, or about double the height of the trees! It is, of course, a practical impossibility for any tree of such dimensions to be so completely unearthed as to display its entire root system, but were this possible, it would certainly be a remarkable sight, since the underground ramifications are obviously immensely more extensive than the aerial branches, though doubtless of a very different character as regards distribution, an enormous tabular ramification of comparatively [illegible] depth presumably existing, as the elm is not reputed to be a deep rooter.

Although a mental image of such an immense root system fills us with surprise, when we consider the needs of an immense tree as regards water supply in hot, dry weather, it appears obvious that nothing less could cope with them. On such a tree there must be hundreds of thousands of leaves and buds, each and every one of which is greedily absorbing water from below and parting with most of it by transpiration through its myriad pores. Sever a twig bearing a few leaves and expose it to the same hot sunshine as pervades the tree, and in a few minutes the leaves flag and wilt, owing to the needful supply being cut off, a proof that the turgidity of the whole of the foliage is only maintained by a constant supply.

Turning now to the source of the supply, in most cases we might penetrate to the greatest depth the roots reach and only find aparently dry, or, at any rate, merely damp soil, so that it is abundantly clear that an infinite number of rootlets must be necessary in order to collect a sufficiency for that individual tree, to say nothing of the many other root systems which are competing in the same area. When, therefore, we consider a dense forest, and picture to ourselves what the conglomerated root systems are called upon to do, one would imagine that nothing less than an immense annual rainfall could suffice to keep the trees going, and yet we are told that less than 30 inches per annum, i.e., less than $2\frac{1}{2}$ inches per month is sufficient for abundant forestal growth over unlimited areas. To look at water of $2\frac{1}{2}$ inches depth one would imagine it to be scarcely adequate for a single hot day, and we have, nevertheless, to bear in mind that a good proportion of even such a rainfall finds it way to springs, and thence by brooks and rivers, goes back unused to the ocean. In any case, when we consider this vital need of vegetative growth, we the more clearly appreciate the immense benefits which must accrue in dry countries through systems of irrigation.

[Photo: F. Mason Good.

A FINE SPECIMEN OF DUNDEE RAMBLER ROSE.

There is no doubt that trees are developed precisely in proportion to the facilities for growth afforded by their environment; the large elms mentioned above would not be where they are had not the nature of the soil and the amount of rain been such as to permit the development and utilisation of the wide-spreading root system indicated by the far distant suckers. Given fruit trees of highly cultivated heavy cropping varieties, the strain upon these must be enormous in very dry seasons, in order not merely to produce a large quantity of juicy fruits, but also to maintain the foliage in active working condition for the maturation of the crop, for we must not forget that it is the leaves which do all the work.

Here, perhaps, we hear a critical remark anent root-pruning as controverting our arguments, but this is not the case; the root system owes its faculty of collection entirely to the myriads of small feeders, and the removal of old and effete root branches tends to the greater multiplication of these to the consequent benefit rather than detriment of the tree. Nature, too, has a knack, so far as fruit is concerned, of repairing damages by extra produce, and thus when a check is induced by pruning either of underground roots or aerial branches, she endeavours to make up for it by additional fruit buds, i.e., reproductive apparatus.

Chas. T. Druery, V.M.H., F.L.S.

SOIL BACTERIA.

The natural fertility of the soil depends to a very great extent upon bacterial activity. Bacteria are plants. Although they were formerly classed as animals, it is now generally conceded that they are plants. They are single-celled and of simple structure, being composed almost entirely of protoplasm; they differ from higher plants in that they contain no chlorophyl (green colouring matter), and they resemble more closely the yeasts and moulds. There are many distinct kinds of bacteria; about 1,200 different kinds have been isolated and studied, and new ones are being found almost every day.

Bacteria are very small, being invisible to the naked eye, and their food requirement varies according to the species. As a rule, bacteria, like other non-chlorophyllic plants, such as mushrooms, require organic food, although some soil bacteria apparently thrive best only on mineral foods. The food absorbed by the bacteria is used in part in the construction of new protoplasm, and in part to produce energy in the form of heat, motion, and possibly light.

Bacterial secretions or waste products vary with the food, environment, and the organism acting. The strong odours produced in putrefaction, as for example, in a dung clamp, are products of bacterial action. In general the toxin excretions of bacteria are injurious to their own bodies, just as the excrements of higher organisms are injurious to the bodies from which they spring. Thus, if the excretions are allowed to remain in contact with the organism they act as antiseptics. Here we have an example of the beneficial effects of a thorough cultivation of the soil, letting in air and light; of the value of a change of crop grown, and of the beneficial effect of an application of lime to sweeten the soil.

It is to their rapid reproduction that bacteria owe their wonderful influence in nature. They reproduce by simple division of the parent cell. The rate of multiplication depends on the food supply, environment, and species. Recent experiments in the Rothamsted Laboratory have shown that some of them, under favourable conditions, divide, thus doubling their number, in twenty minutes; others in three or four hours. Another method of reproduction or propagation is by spores. Spores may be likened to seeds of higher plants, although they are not identical. The spore is very resistant to external injurious influences. Disinfectants of sufficient strength to destroy bacteria are usually not destructive to spores, and spores require a much higher temperature for their destruction than do bacteria.

Bacteria are omnipresent. They are in the air we breathe, in the crust of the earth, on trees, grass, hay, flowers, fruits, vegetables; in lakes, pools, rivers, oceans, the water we drink, in our food—in fact, they are everywhere, except in the interior of the earth and the upper layers of the atmosphere. The necessary conditions for bacterial growth are moisture, temperature, and absence of bright sunlight. A certain amount of moisture is necessary for all life. Drying is resorted to in the preservation of vegetables, fruits, meat, and even dried eggs are now on sale for food. The seeds of nearly all plants are preserved because of the lack of moisture in sufficient quantity to support bacterial growth.

The temperature requirements of bacteria vary according to the species or variety. In general, disease-producing bacteria require the temperature of their host; fermentation bacteria, the ordinary summer temperature; while some soil bacteria thrive almost at the boiling-point of water. The temperature range is very wide, and consequently we find bacteria germs widely distributed in nature. By controlling the temperature of his glass-houses and frames, the gardener can, in many cases, govern bacterial growth.

Ordinary daylight is not, as a rule, very injurious to bacteria, but bright sunlight has a decidedly injurious effect. Bacteria also require certain mineral foods, such as lime, potash, and phosphates for their full and proper development. The general function of bacteria is the reduction of complex organic compounds to simple substances. Plant life is built up from the mineral substances in the soil and from the gases in the atmosphere.

When life ceases bacteria disintegrate the dead bodies, returning the composing elements to the soil or to the atmosphere, to be again used in the construction of new forms of plant life. Thus the life cycle continues. All that has lived must die, and all that is dead must be disintegrated—that is, the ingredients which are the substratum of life must enter into new cycles of life. The law of perpetuity of life thus depends upon the use of food elements over and over again.

Harpenden. J. J. Willis.

ODONTOGLOSSUM CRISPUM MAGNUM BONUM.

Flowers white, with red-brown spots. A.M., R.H.S., May 3. Lieut.-Colonel G. L. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

Aspleniums. — This large genus of elegant ferns contains many species that are suitable for a large variety of purposes in the garden. Many are elegant and useful for filling vases, and they stand dry and better than most ferns, especially when grown in cool greenhouses, and not allowed too much pot room. Equal parts of peat, leaf-soil, loam and sand constitutes a good compost for aspleniums. Water freely and shade from bright sun. Sow spores to increase stock. For greenhouse cultivation the most suitable kinds are A. bulbiferum, A. biforme, A. Fabianum, and A. Nidus-avis.—P. P.

SWEET WILLIAMS.

"Sweet William, with his homely cottage smell."
—Matthew Arnold.

The Sweet William (Dianthus barbatus) has been wonderfully improved during recent years, the heads of blossom being almost as large and handsome as those of the herbaceous phloxes, while the colours are in some cases, richer, if not so bright.

MILTONIA BLEUANA HESSLE VAR.
Flowers white, with crimson-purple disc. F.C.C., R.H.S., May 3. W. P. Burkinshaw, Esq. (gardener, Mr. J. Barker), West Hill, Hessle, Hull.

There is one strain called the auricula-flowered, the flowers of which have clear white eyes, with broad bands round them of various shades of crimson and maroon. Some strains of these have perfectly circular flowers, with no indentation where the petals meet. The true florist's flower has other characteristics, which we learn to look for. There are some very fine salmon-pink varieties, besides various other colours more or less familiar to lovers of these old-fashioned flowers. The normal varieties of a good strain grow about a foot and a-half in height, but there are dwarf forms which do not grow more than a foot. The double-flowered forms are of doubtful value, except perhaps the deep velvety-crimson variety, though the heads of blossom last in good condition longer than the single forms, not taking on that dull appearance which is an objection against the single flowers.

The best way to obtain a stock of these beautiful flowers is to buy a packet of mixed seed of the finest strain procurable from a good nurseryman, and this may be expected to yield a large proportion of flowers with good trusses of large round blooms, with smooth edges and well-defined markings. The seed should be sown in April or May in the open on a nursery bed in a sunny spot, which is better than raising them in pans, as the seedlings in such circumstances so easily become leggy and damp off. They should be pricked out six inches to a foot apart in a bed of good soil in an open position, and in the early autumn should be transplanted into their flowering quarters. The Sweet William is a near relative of the carnation, and, like it, does not succeed in damp or shady places. If the soil is heavy there is nothing better to mix with it than old mortar rubbish. In light soils, especially those rich in lime, the Sweet William may be considered a true perennial, but in soils inclining to dampness it is best treated as a biennial, old plants frequently rotting off in the winter.

It is worth while propagating any specially fine varieties, especially doubles, by taking cuttings early in the summer, the best material for the purpose being the short laterals, which are usually produced from the joints, and the shoots which sometimes come up in tufts from the roots of the parent plants.

Alger Petts.

THE ROYAL NURSERIES, EXETER.

Situated amid surroundings of historic interest the nurseries of Messrs. Robert Veitch and Son have long been famous throughout the horticultural world, and no lover of choice trees and plants who visits Exeter should miss the opportunity of making a tour of the three nurseries occupied by the firm. The "Royal Nursery" (headquarters) is situated in the New North Road, almost adjoining the South-Western Railway Station. Here, although hemmed in on all sides by buildings, flourishes a remarkable collection of choice and rare things, embracing stove and greenhouse plants, orchids, hardy perennials, and alpines, and a large collection of flowering and ornamental shrubs and climbers.

Messrs. Veitch have for many years devoted special attention to the choicer trees and shrubs that are capable of adorning British parks and gardens, and many hours might profitably be spent among the good things here to be seen. The collection of Japanese shrubs is particularly fine, and, in view of their increasing popularity, it is worthy of note that at Exeter all that is choicest and best in the way of Japanese plants is grown in quantity. The lovely Japanese cherry, Prunus (Cerasus) pseudocerasus James H. Veitch, claims special mention as a tree that is worthy a prominent place in every garden. Its double flowers are about two inches across, of a pleasing rose-pink, and very freely produced. Stuartia pseudo-camellia, Raphiolepis ovata, and Wistaria multijuga rosea are taken at random as being among the beautiful plants that have been introduced from Japan, to say nothing of the conifers, such as Podocarpus nageia, Sciadopitys verticillata, and hosts of others that are included in the Exeter collection. There is also a nice-looking lot of plants, on their own roots, of Viburnum Carlesi, hailing from Corea. This plant will take a high position among our flowering shrubs, not only on account of its hardiness, but for the delicious scent of its pretty pink blossoms.

Magnolia grandiflora Exmouth variety blooms here beside the claret-coloured M. Soulangeana nigra. Viburnum rhytidophyllum is a handsome shrub with beautiful dark-green corrugated leaves, having a soft felt-like reverse. It bears corymbs of creamy-coloured flowers, followed by red berries. Cydonia Sargenti, Ribes Gordoniana, Eueryphia pinnatifida, Notospartium Carmicheliæ all merit special notice, but thus one might continue indefinitely to name choice shrubs that the Royal Nursery contains. Under glass are to be seen some fine amaryllis, rhododendrons, boronias, perpetual carnations, that most interesting plant Feijoa Sellowiana, with its myrtle-like flowers, but crimson and white in colour; and, indeed, something of everything worth growing; and in the frame yard are batches of Rehmannia augulata Pink Perfection, Calceolaria Veitch's Golden Glory, Erica Veitchi, and other novelties of the firm's introduction were coming along to meet the season's trade.

At Exwick, where the Cleve Nursery is situated, one may be equally interested in the fine breadths of choice coniferæ, ornamental trees, roses, and fruits that grow with that robustness which bespeaks congenial surroundings and painstaking care. Almost as soon as the gate is entered some excellent young Cedrus atlantica glauca arrest attention, and a few yards further on Pyrus malus atrosanguinea blooms with the utmost freedom, and its richly-coloured flowers produce a fine effect. From a considerable distance one has the attention arrested by some fine specimens of Pinus ayacahuite, which is perfectly distinct from any other pine. It is clothed with fine thread-like needles of a glaucous green, and even on young trees, about 3ft. to 4ft. high, cones exceeding twelve inches in length are borne. Abies bracteata, and A. Brunoniana grow here in quantity, and there is also a good batch of Quercus suber and Lucombiana, the Cork oak. Eucalyptus of many kinds stand the winter unharmed at the Cleve Nurseries, as also does Yucca Whippeli, Abutilon vitifolium, and many another plant that more often than not one sees coddled under glass.

Messrs. Veitch have evidently mastered the propagation of such plants as Mutisia decurrens, M. clematis, Dendromecon rigidum, Embothrium coccineum, Guevina avellana, Dracæna indivisa vera, and Romneya Coulteri, for batches of strong young plants, as well as large-flowering specimens, are to be seen in plenty.

Beside the Cleve Nursery is the seed trial ground, where the extensive collections of flower and vegetable seeds handled at the firm's warehouse are tested under quite normal conditions. The evenness with which the rows of peas, onions, and other vegetables were coming along, and the uniformity to type and colour of the wallflowers, polyanthus, and forget-me-nots that were in bloom bore testimony to the quality of the seeds stocked.

The third nursery is called the "Retreat" Nursery, and is situated at Exminster. Here forest trees, rhododendrons, and hardy heaths form leading features, and right well are they grown. Among the many rhododendrons that have claims to notice the new variety, Dr. Stocker, must be specially mentioned. This is a truly handsome variety that will undoubtedly find its way into the best gardens throughout the land. It is best described as white, tinted lemon, and shaded on the outside with red. The nursery being about five miles from Exeter, and about five from the sea, we were not astonished to find here a large collection of Sikkim rhododendrons growing out of doors, large plants of R. Luscombianum, with its large rosy-pink flowers; R. Kewensis, large and almost white; R. Dr. Stocker, of which an illustration is given herewith; a fine specimen of R. Falconeri, and R. Hodgsoni, with their large, striking flowers, and a host of other beautiful species and hybrids. It is worthy of note that the overhanging branches of apple and other trees are a great protection to these shrubs, and it would be quite possible to grow this class of rhododendron in many parts of England, if they were grown in woods where the autumn and spring frosts are broken, and where they would get some shelter from winds.

Here are also to be found large masses of that glorious Calceolaria Veitch's Golden Glory, and it is quite at home; small plants, planted out in September, have each developed three or four large rosettes of leaves, and give great promise of magnificent blooms. There are large breadths also of Erica Veitchi, E. codonodes, and E. arborea, each showing their distinctive habit and period of flowering.

RHODODENDRON DR. STOCKER.

A handsome hybrid introduced by Messrs. Robert Veitch and Son, with large white flowers, faintly flushed with red.

RUBUS SPECTABILIS.

This is the earliest of the many species of rubus to blossom, and it frequently happens that flowers can be found before the middle of April, whilst it is in full blossom by the end of the month. It is a native of California, and belongs to the raspberry group of the genus. During winter it may be readily distinguished from other species by reason of its light brown stems, which are very conspicuous; in fact, where coloured stemmed plants are encouraged, it is well worth including [illegible] the sake of the bark alone. The flowers are rose-purple, and borne from the leaf axils of last year's shoots. They are not very large, being about three-quarters of an inch across. The fruits are orange-coloured, and ripen early in June, but are not of much value, being rather insipid. Planted in light loamy soil it suckers freely, and grows rapidly into a large mass. If the best winter effect is desired it is necessary to prune away the old shoots as soon as the flowers have fallen, in order that there may be nothing to hinder the full development of the young shoots, and detract from them after the fall of the leaves. A hybrid between this and the wild raspberry, R. idæus, has originated, but it cannot be said to be of any value, for it is less decorative than R. spectabilis, and the fruit is not palatable.

D.

NEW PLANTS, ETC.

MILTONIA BLEUANA HESSLE VAR.

This is a very beautiful variety, and its parentage is M. vexillaria Queen Alexandra and M. Roezli. It has very large flowers, the sepals, petals, and greater part of the [illegible] lip being pure white. There is a golden crest, and around this, at the base of the lip, a regular blotch of bright brownish-crimson. A very fine orchid. F.C.C., R.H.S., May 3. W. P. Burkinshaw, Esq., West Hill, Hessle.

ODONTOGLOSSUM CRISPUM MAGNUM BONUM.

A particularly pleasing variety, with large shapely flowers, posed with great regularity upon a long, arching spike. The flowers are white, with a small cluster of brown spots towards the centre of each petal, and a very bright golden crest on the lip. The finest blotched varieties cannot exceed the beauty of such a form as O. c. Magnum Bonum. A.M., R.H.S., May 3. Lieut.-Col. G. L. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

NARCISSUS COLLEEN.

This is a very pretty variety, with broad, slightly reflexed, pure white perianth segments, and a distinct yellowish-green cup. A.M., R.H.S., May 3. Messrs. R. Wallace and Co., Colchester.

REHMANNIA HENRYI.

This species was found by Dr. Henry near Ichang, and subsequently discovered by Mr. E. H. Wilson in the same district. It is a cool greenhouse plant, and may perhaps be hardy in the extreme South of England and Ireland. Both stems, leaves, and flowers are hairy, the latter are wide-mouthed, yellow, with the five lobes white on the upper half. The height of the plant is twelve to eighteen inches, and as the species is easily raised from seed, and seeds are freely produced under cultivation, it may become fairly popular. "Bot. Mag.," t. 8,302.

AQUILEGIA ALPINA.

A robust and somewhat variable species, but the variability refers chiefly to the spur, and therefore does not really affect the plant from a horticultural point of view. It is a perennial species, and one that makes a strong tap root. The flowers are from two to three inches across, and of a rich violet-blue colour, borne in twos or threes above deeply-incised foliage. "Bot. Mag.," t. 8,303.

RHODODENDRON MUCRONULATUM.

This was at one time regarded as a variety of R. dauricum. It is a deciduous species from Central and Eastern Asia, and forms a close-branching shrub that succeeds in sandy peat, and promises to be a good garden subject. The flowers are borne singly, not in trusses, but as the flower buds are in groups of from two to five at the ends of the twigs, there are plenty of flowers of a pale rosy-pink or very light purple shade, the individual blooms being about two inches across. "Bot. Mag.," t. 8,304.

PITTOSPORUM COLENSOI.

This is a handsome shrub for the winter garden, but, except in the Scilly and Channel Islands, it is not hardy in the United Kingdom. The species is closely allied to P. tenuifolium. The small red flowers are freely produced in the axils of the leaves towards the [illegible] the growths, and also terminally. "Bot. Mag.," t. 8,305.

NOTYLIA TRISEPALA.

A curious little Mexican orchid of dwarf, epiphytic growth. It is interesting by reason of its pendulous racemes of tiny pale green flowers. "Bot. Mag.," t. 8,306.

[illegible] AND HOW TO GROW THEM.—An illustrated [illegible] to propagation, culture, and management of [illegible] and in the open air. [illegible] F.R.H.S. Price 1s. net, by post 1s. 2d. [illegible], by post 1s. 8d., from W. H. and L. [illegible], 148 and 149 Aldersgate Street, London

CYTISUS.

These easily-grown, free-flowering plants are very useful for decorative purposes during the winter and spring months, and as they may be grown in pots of very limited dimensions, they may be used in a variety of ways. It is, however, chiefly as decorative subjects that a few words may be of interest to your numerous readers.

Cytisuses may be readily grown either from seed or cuttings. If by the former method, the seed should be sown as soon as ripe in shallow pans or boxes, which should be placed in an unheated frame. The seed is some time in germinating in such a place, but the plants grow away freely when once the seedlings are through the soil. Where seed has to be purchased this is generally sown in spring with others, and is usually placed in a gentle heat to induce it to germinate freely, but where a few plants are allowed to seed ample may be saved each season for all requirements.

When the seedlings are about two inches high they should be put singly in small pots, and as by the time those sown in spring are large enough for potting, the weather will be sufficiently warm for them to be placed in a cold frame, while those sown when the seed was ripe, and allowed to stand in the seed pans through the winter, will be in a fit condition for shifting on in spring. If potted in a light rich sandy soil, they will grow away freely, and soon make sturdy examples that will flower freely the following winter. If small plants are desired they should be pinched a couple of times through the summer to cause them to become bushy, but where pyramids are required allow the leading shoot to grow away, for if a sufficient space be allowed between the plants during the time they are growing side shoots will push naturally. Where larger examples are desired they should receive a shift as soon as the soil in the pots becomes filled with roots.

By growing a good batch of these, and keeping them in an unheated frame, they may be introduced into a gentle heat, so as to induce them to bloom as required. After flowering the shoots may be shortened, selecting some of the best of them for cuttings. These should be inserted in a light sandy soil, and kept close in the propagating case until rooted, when they may be potted off, and, after becoming established, should be hardened off and treated as recommended for the seedlings. Cuttings will root freely if inserted in a cold frame in the autumn, provided frost is excluded, for though cytisus are not quite hardy, they will withstand several degrees of frost. Cuttings rooted thus should be potted up in spring, and grown on for the summer. Plants that have become too large for decorative purposes, after being wintered in a pit, may be planted out in spring, when, in favourable seasons, they will bloom freely through the summer, and by autumn produce seed, which may be found very useful for raising a stock where means are limited for propagating them otherwise. There are not many species suitable for the greenhouse, the oldest kinds are, however, by no means to be despised. C. racemosus and its variety elegans, C. Atheanus, C. Everestianus, and C. filipes being the most useful.

H. C. Prinsep

ERICA VEITCHI.

A beautiful hardy hybrid heath raised by Messrs. Robert Veitch and Son, bearing a profusion of pure white flowers.

WORK FOR THE WEEK.

STOVE PLANTS.

GROWING PLANTS.—Stove plants generally are now growing apace, and the larger crotons, etc., that were potted earlier in the spring have taken firm hold of the soil, and this being the case they may be helped with a little weak liquid manure. To keep crotons growing and in good colour they must not be starved either at the root or by being kept cold, so really large plants that may not have been potted should also be fed with a little artificial manure. Many of the stove climbers that are being flowered in pots, such as allamandas, bougainvilleas, clerodendrons, and other of the more vigorous growers will all be benefited by a regular system of feeding, either with liquid manure or artificials, as advised above.

INSECTS. — A very sharp look out must now be kept for insect pests, and those in charge should endeavour to keep the plants moved, regularly turning them round whenever possible, thus presenting another part of each plant towards the syringe; the plants will grow a much better shape when moved regularly in this way. A bi-weekly spraying with paraffin emulsion or some other insecticide would of course do away with all pests, but these remedies must not be carelessly used or much damage may result. I noted only this past week someone advising the use of cold water in volume as a remedy for mealy bug. This is so provided the plants infested have good hard leaves, such as crotons, gardenias, ixoras, etc. By getting the plants down somewhere near a drain and giving them a thoroughly hard syringing, washing them thoroughly all over with quite clear water, mealy bug may be entirely eradicated. This is the treatment I accorded several specimen crotons I happened to have charge of some years ago, and after three or four such doses, at intervals of ten days or a fortnight, these plants were quite clean. Where stove room is really limited such plants as acalyphas, hibiscus, clerodendrons, etc., may be relegated to a house of slightly lower temperature, but where, of course, they may receive the same kind of treatment as to syringing, etc., as in the stove proper.

GLOXINIAS AND STREPTOCARPUS.—The main batches of these will now be growing freely, and as the flowers begin to push up rather more air may be given, and the syringe used less frequently, though a morning and afternoon syringing among the pots will still be beneficial. Young plants of gloxinias from seed raised early in the year should shortly be ready for 60 or 48 sized pots, these latter being quite large enough for the first season; if kept growing steadily they should make good plants for blooming during the latter part of July and August. Streptocarpus seedlings do not grow quite so quickly, but they may be accorded the same treatment and practically the same compost.

WINTER - FLOWERING BEGONIAS should be potted off into thumb pots or 60's as soon as they are nicely rooted, and when a shelf is available for them, shaded and away from draughts, they will do admirably; failing this then any position in a warm house or heated pit will do, but bear in mind that these plants in their young stage do not like either sun or much air, but love as much heat and moisture as possible, 65 deg as a minimum at night being about right.

FIRING.—Dispense as much as possible now with the fire-heat, turning it off the stoves during the day whenever the weather permits; when it cannot be turned off bank the fire up early in the morning with sufficient damp ashes to prevent it burning through during the day.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

PLANTING VINES.—In cases where it is intended to replace unsatisfactory vines that were forced early in the season, by young plants raised from eyes; or where, for any other reason, young vines of this description are to be planted at the present season, there should now be no unnecessary delay in making the needful preparations. Vines of this kind should be planted in inside borders, made at a sufficiently early date to have become warm before planting takes place; but, if this is impracticable, a liberal quantity of warmed compost should be placed immediately around the roots. Well-rooted vines may be planted at any time during the next few weeks. See that the soil is moist when they are turned out of their pots, and firmly place the balls of soil (surrounded by specially-prepared compost) sufficiently deep in the border for their surface to be slightly covered. Carefully secure each vine to a cane, lightly mulch with short horse manure, and give enough tepid water to settle the soil. For a few days after planting keep the atmosphere of the house moderately close and moist. Syringe the vines with tepid water in the morning and early afternoon, and if necessary shade them on bright days. Vines should be planted at from 4ft. to 6ft. apart, in agreement with the character of growth.

EARLY VINES.—Where grapes are nearing their colouring stage, if the borders require it they should be given enough tepid clear water to moisten them through; and as soon as the colouring commences the atmosphere of the house should be kept dry,and the ventilation by day be considerably increased, in agreement with outdoor conditions. After the fruit is ripe its colour will be better preserved by the vines being lightly shaded; fish-netting or some similar material will answer the purpose. The Black Hamburgh especially deteriorates in colour unless protected from bright sunshine. Keep the vines clear of red spider by a careful use of the sponge.

LATE VINES.—As soon as practicable after the flowers are set, a suitable number of the best bunches should be selected for the crop, the laterals finally secured to the trellis, and their sublaterals stopped. The thinning of the berries should be commenced and persevered with as they become fit. Owing to the length of time these grapes are kept they should be, compared with early varieties, severely thinned, and those that respond to it should have their shoulders looped up, but only by painstaken experience, combined with a knowledge of the character of each variety, can these operations be perfectly accomplished. Once the thinning is completed the borders should be mulched with good farmyard manure, and if required a thorough watering given. From now, and until the fruit commences to colour, the vines should be nourished with manures; the qualities of which should be ascertained before they are used.

EARLY PEACH HOUSE.—Immediately before the fruit commences to ripen give the borders an efficient watering, and do not repeat it until the fruit is gathered. If woodlice are present hollow out halves of beetroot, or mangold wurzel, and place them hollow side down in their haunts; frequently examine these, and brush the lice into a bowl of hot water. Discontinue syringing the trees during the fruit-ripening period, and keep up a circulation of air through the house during the day according to the weather, and in a less degree by night. Gather the fruit at an early stage of ripeness.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

MUSHROOMS.—Beds made at the present time behind north walls will be more productive than those in the mushroom house. No pains should be spared to keep up a constant supply, particularly as the last two seasons have been so uncertain in regard to the natural meadow crops in many parts of the country. Providing the horse droppings have been prepared, the whole well sweetened, and the temperature on the decline, wheel the manure to the foot of the wall facing north, and commence the bed with a width of about three feet six inches at the base, packing the material evenly and firmly in a sloping fashion to a point which will be about four feet up the wall. When the bed is completed by beating and treading, place sticks to ascertain the temperature, and when the latter has receded to 75 or 80 deg. it can be safely spawned. Insert the spawn eight inches apart and three inches deep, replacing the manure over the spawn very firmly. When all danger of excessive heat is past, soil over the bed firmly two inches deep, and place over this a good covering of long stable litter to retain a steady heat and natural moisture. Later attention must be governed by the state of the weather as regards damping and watering. If later on the bed shows signs of premature exhaustion, apply a thorough soaking of warm diluted liquid farmyard manure.

THINNING.—Very frequent mistakes are made through insufficient thinning of vegetable crops. Parsnips should be thinned nine to twelve inches apart, and carrots to three or four inches at the first thinning, delaying the final thinning when one is sure of all danger from fly and slugs is past. The later thinnings of carrots can be used for the kitchen. In both cases ply the Dutch hoe frequently, and give occasional dustings of soot, or even finely-sifted burnt refuse, especially if the ground is of a heavy and retentive nature. Peas and French beans often suffer from the same cause, therefore as soon as it can be seen that they are strong and flourishing, thin them out, giving each plant sufficient room, and fill in any "gaps" that may have been caused by mice or slugs with the plants so drawn. Light dustings of soot are very beneficial to peas. Lettuce should be thinned as early as possible, transplanting them to form a succession. After June comes in it is far better to sow lettuce at frequent intervals, and not rely on transplanted ones. Very little trouble is experienced in maintaining a supply of fine crisp lettuce during very dry weather, if precautions are taken to draw deeper drills, scatter a good dressing of old potting soil along the same, and well soak the drills before sowing; finish off an inch below the ground level.

POTATOES.—The early planted varieties will need every care against frosts. As soon as they appear above ground, well hoe, and work the soil around them, earthing them up when about three inches high. Have them covered with protecting material should frost be anticipated.

TOMATOES.—By the end of the month these should be in their open quarters, therefore they should now be gradually hardened off by placing them in some sheltered position. Wherever it is possible place them against a wall facing south, and if old garden lights are available place them over the plants until well established, as a great gain results from their use. It is now a good time to make another sowing for autumn use under glass. Tomatoes that are fruiting in pots or boxes will need regular applications of liquid manure and frequent sprinklings of artificial manure. Suppress all side growths, remove decayed leaves, and maintain a fresh, buoyant atmosphere.

CAPSICUMS, CHILLIES, AND AUBERGINES can now receive their final potting, using a compost of two parts loam, one part spent mushroom-bed manure, sand, and mortar rubble; pot firmly, arrange the plants near the glass, and maintain a humid atmosphere of about 60 deg.

RIDGE CUCUMBERS. — If thoroughly hardened off plant these in trenches at the end of the month; place eight inches of pig manure in the trench and cover this with six inches of soil. Heavy crops are grown this way.—Geo. Ellwood, Swanmore Park Gardens.

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

ROSES AND THEIR CULTURE.

The following is the text of the paper read by Mr. W. H. Massie before the members of the Scottish Horticultural Association:

Stocks.

The principal stocks now used for roses are the briar or Dog Rose (Rosa canina) and the Manetti (R. blanda, var. Manetti); but the Sweet Briar (R. rubiginosa), R. multiflora and its variety "de la Grifferæ," and R. rugosa, all of which are supposed by some to possess special qualities of their own, are also occasionally used. The briar or Dog Rose, is either raised from seed or grown from cuttings. The seedling briar I consider the most useful of all stocks, and if we were restricted to one it would be this. Its chief characteristics are lateness, free-rooting, constancy of flowering, good quality of bloom, and long-lasting plants. Later in starting into growth than either the cutting briar or manetti, it frequently escapes injury from late spring frosts and trying cold winds when plants on the other stocks suffer. It is peculiarly well suited for hybrid tea, tea, noisette, and China roses, and its plentiful roots are long and strong and run far and deep in search of nourishment. When young, plants on this stock may not look so strong and vigorous as on some of the others, but when established they are longer-lived, have a longer flowering season, and give blooms of better quality and more refinement. Its one drawback is that it is somewhat more difficult to bud, and it therefore usually gives a lower percentage of "takes" than the others.

The cutting briar is possessed of many of the qualities of the seedling briar, with the additional advantage of being more easily worked. It is somewhat earlier, and not being so deep-rooting it is more suitable for shallow, light soils; but it is more sensitive to drought. It is well suited to hybrid perpetuals, hybrid teas, and the forms of R. Wichuraiana. It has a longer-growing season than the manetti, and, in good seasons, will bloom well into August and be ready for another crop of flowers in the following month. The manetti stock is grown from cuttings, and is the most easily worked and the earliest of all. It is suitable for hybrid perpetuals, with some few exceptions, such as Her Majesty, Madame Eugene Verdier, Sultan of Zanzibar, etc., and also for the varieties of the moss rose, and the climbing forms of R. multiflora. It is suitable for light soils, but it is apt to produce suckers, which are often not recognised by amateur growers, and are allowed to grow and starve the budded rose. Care must therefore be exercised in removing these. In planting roses on this stock it is well to place the bud entirely—say two or three inches—under the surface of the soil, so as to induce the budded rose to establish itself on its own roots, and thus prolong its life. Roses worked on this stock make finer, healthier plants as maidens, but often they do not last more than two or three seasons, and more especially does this seem to be the case when they are used for tea varieties.

The sweet briar is estimated by many as an admirable stock for the tea rose Gloire de Dijon. Rosa multiflora is a vigorous growing stock which is easily propagated by cuttings, but by many it is considered a bad transplanter. It has, however, been used successfully with some of the stronger-growing hybrid teas and teas. Its variety de la Grifferæ is also a very vigorous-growing stock. It is not, however, much used now, though by some it is considered to be very suitable for the strongest growing pillar roses. It is a gross grower, and is apt to smother the bud in the case of the less robust varieties. For standards, strong root suckers of the Dog Rose are the best stocks. These are usually collected from hedgerows, and in some parts of the country where they are plentiful there are those who make a business of collecting them. They should be clean, straight, year-old shoots, from one-half to one inch in diameter, and of a dark-green colour. The smooth, light-green shoots of one-summer's growth are useless. They are cut away from the plant with a portion of the hard roots as well as some of the fibrous roots attached, and they must be carefully trimmed to prevent the production of suckers. They should be selected, and cut to the required lengths—half-standards about 3ft., and full standards up to 6ft. long. The former are chiefly used for the tea and hybrid tea varieties—which are considered to produce finer flowers when grown in this style—and the latter for the forms of R. Wichuraiana, and other weeping varieties. Rosa rugosa is also used by some as a stock for standards, but it is frequently thin and wobbly, and is not so popular as the Dog Rose.

Budding.

The most important thing to consider in order to secure a good "take" of budded roses is the stock, and when one sees a thin inferior crop of roses in a nursery or elsewhere, in nine cases out of ten it is due to inferior stocks having been used. Every care should therefore be taken to plant selected stocks of full size, and cultivate them in such a way as to have them vigorous, healthy, and sappy. In this district August, as a rule, will be found the best time for budding, but something depends on the season, and where large quantities have to be worked they should be commenced as soon as good buds in the right condition can be procured. Vigorous healthy stocks are always in condition in advance of the buds. The buds should be firm and well-ripened, but in full sap, so that the bark will part readily and cleanly from the wood. The selection of the buds is important. Not only should they be taken from the best plants, but those from the middle part of the best flowering shoots should be selected (buds at the top of the shoots are inferior), and, if possible, when the flower has just passed its best. Careful attention to this will not only ensure a better take, but it will actually improve the strain and make the plants more free flowering.

In the case of sports, such as Climbing Mrs. Grant, Climbing Captain Christy, and Climbing Caroline Testout, care should be taken to select buds from true climbing wood, otherwise they will soon revert to the original form. After selecting the buds, expose them as little as possible to the sun till they are fixed in the stock. Dwarf roses should be budded below the surface of the ground, and as close on the roots as possible. In the case of standards, all shoots should be removed, excepting two or three selected ones at the top, and in these the buds should be inserted as close to the side of the stock as possible. In autumn the young shoots on the standards should be shortened back to within six inches of the bud, and in the following April they should be cut close down to the bud, and at this time dwarf stocks should also be cut down to the bud. As soon as the plants come into growth, stakes should be put in and all suckers removed. At this stage a sharp lookout must be kept for caterpillars and green-fly.

General Cultivation.

The ideal soil for roses is a deep, rich, strong loam; but given a fairly good climate, a pure atmosphere, and a soil that is not water-logged, with proper attention good roses may be grown anywhere. Every grower has a different subject to deal with in the way of soil, and trouble should be taken to find out what it is, and the condition it is in, and treat it accordingly. It does little good to say, "Give so much of this manure, and so much of that per yard or per acre," when one knows nothing of the subject on which they are to be used, so I shall only indicate on broad lines what I have found to be useful in this way. When in a healthy, vigorous condition, roses can take a lot of feeding and stimulants, and they give a rich return for them. Good farm-yard manure is the most important of all feeding materials, and it should be forked-in about the plants in late autumn, along with some phosphates (bone meal) and potash. Many roses suffer from want of lime, and this can be applied to the surface in autumn after the forking. When they start into growth in spring two slight dressings of nitrate of soda, at intervals of a fortnight, and at the rate of about 1cwt. per acre, will induce a strong and vigorous growth. From then till the time the buds are well formed nothing will suit them better than applications of liquid manure from the byre.

Frequent stirring and cultivating of the soil is of the greatest importance. Where planted in lines, the "Planet Junior" cultivator is an excellent implement for this purpose, and will easily stir the soil to a depth of two inches. This may be done weekly when weather permits, and not only will this cultivation keep down weeds, but it will encourage the best kind of growth, and give protection against drought. The plants must be kept clean and free from insect pests, and the greatest safeguard against these is to keep them in a robust, vigorous-growing condition. If ramblers can be induced to throw strong, vigorous growths, 8ft. to 10ft. high, few pests will interfere with them. When green-fly, caterpillars, or mildew do appear they should be attacked at once. Spraying with quassia extract will quickly destroy green-fly, and even stop mildew if it is taken immediately it makes its appearance; but if the latter is allowed to establish itself, a dusting of sulphur and slaked lime in equal portions will help to check it. For caterpillars of various kinds, leaf-rollers, etc., hand-picking and destroying is most effective. But against all these and many other pests the greatest protection lies in the encouragement of lusty health.

Pruning.

Rose-pruning can be done at any time after the flow of the sap has ceased till the reawakening of growth in spring, but in our climate, with our danger from spring frosts, it is safer to delay it till the end of March or beginning of April. In deciding on the method of pruning, many points must be taken into consideration, for instance, the class of bloom aimed at, the form of plant desired, the variety and its constitution, and so on. In every case dead and weakly wood should be completely cut away. As a rule, the harder the shoots are cut back in spring, the stronger will be the new growths in summer. If one wants blooms for exhibition purposes, the shoots should be cut back severely; if for garden decoration, where quantity rather than quality is the object, they should be left longer. If the variety is of weak growth, probably it will have been frosted, and the only thing that can be done is to cut its shoots hard back. Maiden roses planted in autumn should be pruned the following spring, and should be cut hard down to within three or four inches of the ground, and always above a bud pointing outwards. In pruning for ordinary purposes, the form of the plant should be regulated and brought into whatever style is desired. All dead wood and all unripe and very weakly shoots, as well as cross shoots, should be cut out and others shortened where necessary, so as to keep the centre of the plant clear for fresh growths. Bushes for decorative purposes need thinning and training rather than pruning. Summer thinning is of much importance, especially in the case of climbers. Directly the plants have finished flowering, undo the ties and cut out all shoots which are more than two years old, at the same time thinning and regulating those which remain, leaving only what are necessary for next season's flower. The selected shoots are then spread out so as to give them every advantage in ripening. If this practice was more frequently followed we would hear fewer complaints of ramblers being frosted back in spring and flowering indifferently than we do.

Exhibiting.

Successful exhibiting of roses demands the same qualities which lead to success in other directions—common sense, careful labour and forethought, with good taste added. To be victorious, the right varieties, of right quality, must be grown, but it must be borne in mind that a well-handled, well-set-up lot will always beat an equally good lot of blooms if they are indifferently staged. Let all details—the preparing of the exhibition boxes, the writing of the cards, the providing of fresh green moss, etc., be considered in advance. The cutting of the blooms must be considered in relation to the weather and the distance from the show. Roses cut in the early morning are certainly fresh and bright, but many experts consider them less reliable than those cut the previous evening. As soon as they are gathered let them at once be placed in water, or if they are to be carried to the boxes in a basket, let the stems be again cut before being put in the water. After being drawn, let the water stand for an hour or two before use, and it should be about 5 deg. lower than the afternoon temperature. Only experience can teach the best age of bloom to select, as some varieties develop more quickly than others. Some sorts must be taken almost in the bud, others half-developed, others fully-developed. Clean, healthy foliage adds much to their attractiveness, though some consider that roses staged with much foliage are more sensitive to heat, and for that reason cut the leaves away, with the exception of one.

Dressing is a somewhat vexed question, but most blooms can stand a little touching up. The point is not to destroy or alter their character, but to preserve their natural beauty. No one can admire a pointed rose with its leaves turned back to resemble a gardenia. Aim at having freshness, colour, form, size, and healthy foliage. The boxes having been mossed, the supports placed, and the tubes filled with water, the blooms are now set up. Evenness, variety, and contrast must be aimed at in arranging. Large blooms should occupy the back line, the smallest the front, and the intermediate between, and the colours should be so contrasted as to bring out the effect of each, and give a pleasing and tasteful appearance to the whole. The back line blooms should stand about six inches above the moss, bearing in mind that high staging detracts from size, and that short-stemmed blooms last better than long-stemmed ones. Some encouragement is now given to the exhibition of long-stemmed roses in vases, which I personally strongly approve of, and there is much scope for the display of taste in their arrangement. As these cannot be carried to the show in water, young blooms should be selected for this purpose, and they should be cut and placed in water for a sufficiently long time to absorb a copious supply. Damp moss may be placed round their stems before they are laid flat in the shallow boxes in which they are carried. The same applies to decorative and single roses shown in bunches. For some varieties of these a certain amount of wiring is required, but as little as possible of this should be resorted to. Single varieties should be cut as young as possible, so as to secure the fresh, golden stamens, which give them one of their most attractive features. When the stamens turn black it indicates that their freshness has gone.

Crossing Roses for the Raising of New Varieties from Seed.

I wish to impress as strongly as I can upon the members of this association the great, important, and attractive field open to them here, and to plead with everyone of those who may have the opportunity to take up this work, if even in a small way. It is a fact that a great number of our roses are the produce of seed not artificially fertilised, and I believe it to be equally true that when we get our Scottish gardeners and amateurs earnestly set to the work of hybridising and improving the rose we shall see varieties raised which are beyond our wildest dreams, and before which the most beautiful sorts we have at present will pale—colours and perfection of form yet unknown, with intoxicating perfume, and hardiness and vigour that will revel even in our climate. So far this work has been left in the hands of a few traders, much occupied in struggling to make ends meet.

The process of fertilisation is a simple, though delicate, one. The varieties to be operated on should be decided upon, and they should be potted so as to be easily under control when required. The implements required are fine forceps, a very fine brush, and a magnifying-glass. When the bloom is getting ready for fertilising, isolate the plant in the greenhouse, remove the stamens in good time, and look carefully to see that not a particle of its own pollen is left, as the smallest grain might be enough to upset all our calculations. If the pollen to be used in making the cross ripens too soon, it can be kept for days in a cool place if hermetically sealed, but, of course, it is best to use it direct from the flower. When the time for fertilising has arrived the pistil becomes sticky from secreted nectar; and even this can be applied artificially by supplying a drop of water and honey mixed. Morning is the best time to operate. Pass the fertilising brush over the pollen and lightly dust the stigmas with it. It is advisable to repeat the operation after an interval of two or three days, as the stigmas sometimes refuse the pollen, especially when the bloom is very full.

In due time the "hips" should appear. They take various colours—red, yellow, and sometimes blackish-crimson. Be careful not to gather the hips till they are quite ripe. Seed may be sown immediately after gathering in autumn, in sandy leaf-mould. Many of the seedlings will flower the first year, but some (usually the best) take longer. The first flowers of the seedling are single, and rarely have two or more rows of petals. Those which show flowers with the largest petals and best colouring should be selected, and they should be transplanted in autumn. As the plants gain in strength their flowers improve, and the best of them may then be budded on the briar or manetti stock, and further pruned.

Lettuce. — In nearly every establishment there exists a greater or less demand for lettuce, and at no seasons are they more welcome than late in winter and during the early spring months. A sowing made in January under glass, placing the seed pans upon a warm hotbed, and growing the seedlings on under cooler conditions, eventually planting them out into frames set upon a hotbed of manure, mature in time to overlap the supply from the crop wintered in frames. A small rapid-hearting lettuce of the Tom Thumb type generally yields the best results from a mid-winter sowing. The plants not only mature rapidly, but the crispness and flavour of the leaves are all one can desire.—Thomas Smith, Walmsgate Gardens.

Cydonia japonica Sargenti.—The uses to which a flowering shrub of moderate dimensions may be put are many, and when the flowers are freely produced, and are of a bright telling colour, the value of such a shrub is great. On this account the strikingly beautiful cydonia above-named must be reckoned among the most desirable spring-flowering subjects available. When grown in the open it forms a low-spreading bush which, even while quite small, produces during April and May a quantity of clear orange-scarlet flowers that show up in a most striking manner against the dark stems and foliage. Planted in the foreground of a shrubbery it provides a welcome note of colour at a time when rich glowing shades are particularly valuable. It is a fit subject for a bed upon a lawn, or for a prominent position on a large rockery. In common with other members of the genus C. j. Sargenti may be grown against a wall, and is one of the best of plants for a position under a bay window, or on a low terrace wall. Its colour adapts it for use against white bricks or light-coloured stone, but it is not seen to advantage against red bricks or stone of a terra-cotta hue. It is not an expensive plant, and therefore deserves to find a place in every garden.—M. A. C.

CAMPANULA PYRAMIDALIS.

This stately plant is said to have acquired the name of chimney campanula from the fact of its being often trained to sticks fan fashion, and used as a fireplace ornament in the summer. If not the most beautiful, it is certainly the most repaying, of the campanula tribe, by reason of the succession of blossoms produced for a period of two to three months. It is a grand plant for the hardy flower border on favourable soils, that is, those inclining to lightness, while as a pot plant for the conservatory, or elsewhere, few things surpass a well-grown specimen some five or six feet high, with ten or a dozen spikes, and such examples are by no means unusual. It does well amongst trees and partial shade seems not unfavourable to it. It is comparatively hardy, but on wet soils it needs to be protected during a severe winter, or even taken up and put in pots.

In some soils it will last several years, though deteriorating after the first flowering, but the most satisfactory way of growing it is as a biennial, and plants which do not flower the year after sowing—there are always some which do not—being kept till the third year, when they will make magnificent specimens.

The principal secret of success is to get plants as strong as possible the first year by sowing in spring in gentle heat (though this latter is not absolutely necessary) in light, sandy soil. The seeds, like those of most species of this genus, are very minute, and need to be covered very lightly. The young plants resent much heat or lack of ventilation, and as soon as they can be handled they should be pricked out into boxes or pans, and as soon as they are big enough put out a foot apart on a prepared nursery border where they will receive a fair amount of sunshine.

If it is desired to grow them in pots throughout a rather unnecessary labour they should be put in small sixties at this stage in a compost consisting of two parts turfy loam and one part leaf-mould, and with this should be mixed some bone-meal at the rate of a quarter of a pound to a peck of soil. Failing this latter, mortar rubbish and basic slag are both good, unless the soil is already of a chalky character. They should be potted on according to the needs of the plant, some of them eventually needing ten or twelve-inch pots if they do well. It is not advisable to move them into larger pots towards autumn, as they stand the dampness of winter better when the pots are well filled with roots, and they can be given their final shift in the spring. The plants should be wintered in a cold frame, and when the spring growth is in full vigour they should be liberally fed. Those put out on a nursery bed may be left there, unless the soil and situation are unfavourable, or, if somewhat grown together, alternate plants may be taken up and put in their flowering positions in the borders, or potted up and put in a cold frame for the winter. This is less trouble than growing them in pots throughout, and they will not suffer from the move if this is done carefully in October in damp weather, as they are moderately fibrous rooters.

Tying the plants when they run up to flower needs some care if their beauty is not to be marred, as there is so little foliage to hide the sticks, and yet some tying up is absolutely necessary, at least for those in pots; C. pyramidalis is a blue flower, but the white variety, C. p. alba, is perhaps the more beautiful of the two for indoor decoration, as it shows up better in a dued light, few plants producing such a telling effect as a well-grown specimen standing in the hall, fireplace, or corner of a room.

Propagation may be effected by taking short young growths from the crowns of the roots with a little piece of the bark attached. These should be put in light soil, in heat, and kept shaded for a time.

ALGER PETTS.

CYCLAMEN CORMS IN LEAF-SOIL.

Different growers have diverse ways of treating their old cyclamen corms after the flowering period is over. Many discard them altogether and rely upon young stock. Undoubtedly, young corms are more valuable than old ones; but the latter are extremely useful. Corms one year old cannot, however, be termed old ones, yet the treatment that I wish to refer to here suits them equally as well as it does very old ones.

A bed composed of well-decayed leaves rubbed through a half-inch sieve is made up in a cold frame, and the corms, after the removal of the old soil from their roots, are planted out a few inches apart in this bed. A thorough watering is given to settle the soil around them, and then the lights are put on, but tilted high both at back and front, so that a current of air passes through. Watering is not done for a month or six weeks, except to prevent the leaf-soil from getting dust dry. But afterwards the bed is kept moist, and the glass lights are put down, air being admitted only at the top, and by the middle of August at the latest splendid growth both of leaves and roots will be made, and the plants may be then carefully potted. This treatment has resulted in fine batches of plants.

G. B.

Linaria reticulata aurea-purpurea.—This is a quaintly beautiful little annual that might well be more often used in small beds or in patches on a sunny border. The flowers, though small, are produced with the utmost freedom, and are of very pleasing colour, rich velvety red and bright golden-yellow being clearly defined in each tiny blossom; these little flowers make a braver show than many things of much larger size. Seed should be sown in rings or patches where the plants are to flower, and if a second sowing is made as soon as the first batch is growing well the flowering period may be extended right through summer and autumn. All that is necessary is to cut away the first-sown plants as they get past their best, in order to give more room for the plants of the later sowing.—M. A. C.

EXHIBITIONS AND MEETINGS.

◆

Croydon Gardeners' Society.

Perhaps in no other vocation are the two essentials, theory and practice, brought into requisition more than in the occupation of the gardener, and in a lecture by Mr. R. B. Leech, Wood Hall Gardens, Dulwich, before the members of the above society at the Sunflower Temperance Hotel on Tuesday last, the theoretical part of syringing and damping down greenhouses was clearly defined. Mr. Leech, in introducing his subject, alluded to the importance of this study in the treatment of plant life. Generally speaking, in exotic or temperate houses where plants are grown we are adapting the life of a plant to a different environment than its natural habitat, and therefore to do this successfully we must copy nature as far as possible. The lecturer referred to a lecture a fortnight since on "Leaves," which had been given before the society, and bearing this in mind the members would clearly remember the functions of the leaves to the plant, that had been made so explicit, and he dwelt more especially on the transpiration carried on through the leaf. To assist the plants in this work of transpiration is the fundamental principle of syringing and damping down greenhouses, and no hard and fast rules can be laid down, but the gardener must bring observation and experience into play to do it successfully.

The use of the syringe indiscriminately he deplored, for the constant wetting and saturating the foliage retards instead of augments the action of the roots, because the excess of moisture resting on the plant and in the atmosphere surrounding it clogs the stomata or breathing pores in the leaf, and when this occurs then the other organs of plant structure are thrown out of gear.

Another strong point to be remembered in surcharging the atmosphere around plant life with moisture is that it has a tendency to increase insect and fungoid pests, and there need be no doubt of this when we remember the wet season of last year, when both these pests were rampant.

The atmosphere outside the houses is another great factor to study when syringing, and the quantity of moisture given should be regulated according to that. With a hot, dry atmosphere outside it means that transpiration in plant life goes on more rapidly, and therefore the plant can take more moisture.

How Nature in her perfectness protects her subjects was illustrated with a reference to the Victoria Regia, familiar to all. In this plant the leaves have the stomata placed on the upper surface, and growing on the water as the leaves do, the constant ripples would flood the breathing pores were it not for the upturned edges of the leaf as a protection.

Although not by any means an advocate of withholding moisture from the atmosphere of the houses, the lecturer impressed upon his audience the wrong which can be done by excess. Practical methods of administering moisture will be dealt with a fortnight hence, when Mr. Leech concludes the second part of his lecture.

A short discussion followed the lecture, and Mr. Leech was heartily thanked for his very interesting discourse.

Mr. F. Oxtoby exhibited a number of plants of the white intermediate stock All the Year Round, which were much admired, and a very unique exhibit came from Mr. W. Bentley, who brought a bulb of Chrysolora tulip with four blooms, all of good size.

National Vegetable Society.

At the recent meeting of the above society Mr. A. Dean, V.M.H., presided, and the report of the Sub-Committee was received of the trials of early cabbages at Mr. Poupart's, Marsh Farm, Twickenham, and from Mr. C. Foster, the Times Experimental Station, Sutton Green, Guildford. Nearly forty varieties were tried in various ways from two sowings to test earliness and other points. At this meeting it was decided to place the varieties in groups, and in due course a full report will be issued to the horticultural press, with the Sub-Committee's reports on growth, characters, and the value of varieties for garden purposes. The onion trials at both the above grounds promise splendid results, and owing to the great number of diverse stocks should prove most valuable. The thanks of the society was heartily tendered to Messrs. Poupart and Foster for their splendid work, and their kindness to the Sub-Committees when visiting their establishments, as well as for the time and attention they have given to these trials. Other minor matters were transacted, and it was decided that to better meet the convenience of members meetings should be held earlier in the day than at present.

East Anglian Horticultural Society.

Mr. William Mallett, of Messrs. Hobbies, Lim., Dereham, read a most interesting paper at the May meeting of the above society upon "Roses." He stated that roses were divided into sixteen sections, but he was only devoting his remarks to two of these, viz., the hybrid teas and the Wichuraianas, these being those to which hybridists of the present day had devoted most of their attention. He said that the hybrid tea stood far away in front of others for garden decoration and for forcing purposes. Practically they were the true perpetual-flowering kinds, for one could generally obtain blooms quite into December. To aid the novice Mr. Mallett

BY SPECIAL APPOINTMENT TO HIS MAJESTY KING EDWARD VII.

GREEN'S LAWN MOWERS

THE FIRST, FOREMOST, and BEST in the WORLD. Hundreds of Thousands are in use. Established nearly a Century.

Highest Awards — Royal Botanic Society, Royal Horticultural Society, and numerous other Gold Medals.

"SILENS MESSOR" LAWN MOWER.

DONKEY, PONY, AND HORSE MOWER
Either "Silens Messor" Pattern or Wheel-Geared.

ORDINARY AND WATER BALLAST ROLLERS

May be had of any Ironmonger or Seedsman in the United Kingdom.

Please write for ILLUSTRATED PRICE LIST No. 1 FREE.

MOTOR LAWN MOWERS & ROLLERS MADE IN VARIOUS SIZES.
Three Motor Mowers and One Motor Roller recently supplied to His Majesty King Edward VII.

THOMAS GREEN & SON, Ltd., Smithfield Ironworks, Leeds, & New Surrey Works, Southwark St., London, S.E.

explained the whole procedure of fertilisation and raising of seedlings, casually remarking, however, that he knew of a batch of 3,000 seedlings which only produced six varieties worth recognition at the hands of the N.R.S. The Wichuraianas had sprung rapidly into popularity as objects of real beauty for pillars, pergolas, arches, etc. Moreover, they lent themselves admirably for early decoration as forced plants. A list of the best varieties in both sections was detailed, and, thanks to the kindness of Messrs. Hobbies, Lim., a large collection of the types, in pots, were placed upon the tables; these were frequently alluded to, and much appreciated.

A lengthy and animated discussion followed, in which Messrs. Lewis Smith, C. Matthews, A. Reeves, J. H. Clements, E. Peake, H. Perry, C. Fox, J. Powley, and others took part. Besides the paper, other matters were discussed, including the summer excursion of the society. The exhibition tables presented a gay spectacle. Messrs. Daniels Bros., Lim., Norwich; Frank Neave, Lingwood; F. Wilby, gardener to F. Bainbridge, Esq., Hethersett; and W. Rush, gardener to F. P. Hinde, Esq., Thorpe, contributing most interesting specimens.

In the competitive section Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, secured most points in the first section of the Dawson Paul Challenge Cup, which was for six varieties of hardy flowers. He also had the best strawberries, a dish of wonderfully well-coloured berries. Mr. F. Williams, gardener to Louis Tillett, Esq., Catton, also had some fine fruits. Flowers in general were good. Vegetables were well represented, and in this section Messrs. Daniels Bros.' early pea Express was shown in fine condition.

TREE CARNATIONS IN FLOWER BEDS.

References have been made by some gardeners to the advisability of planting tree or perpetual-flowering carnations in flower beds in the garden. Personally, I would not adopt the plan on a large scale, but I must say that I saw several varieties, including Britannia and Fair Maid, growing splendidly in an Essex garden last year. The plants were very bushy and healthy, and bore flowers freely during the summer months and well into the early part of autumn. As your able correspondent, Mr. C. Flack, says, on page 378, we now regard the tree carnation as a most valuable asset in the production of cut flowers throughout the winter and spring months of the year. I also agree with other remarks made by your correspondent anent this increasingly popular flower. Its cultivation is, as yet, in its infancy, and as time goes on we shall see a vast improvement both in the quality and colour of the blooms, and also in the habit of the plants. An abundant supply of flowers will be available during the greater part of the year. G. B.

Kalosanthes.—The kalosanthes, or crassulas, are among the most useful of bright and attractively-flowered succulent plants, as they are alike suitable for decorations and for specimen culture. They can all be readily increased by means of cuttings of the tops of shoots that have not flowered. The most simple course of procedure is to insert the cuttings in three-inch pots, three in each, and then shift them on without their being separated. The cuttings may be struck at any time during the summer, and should be placed in an unheated frame. Turfy loam, to which a liberal addition of coarse sand, and a small proportion of broken crocks have been added, should be used, and efficient drainage be provided, as they are, like other succulents, especially susceptible to injury from stagnant moisture in the soil. For general purposes the best are Kalosanthes coccinea, remarkable for its large heads of brilliant scarlet flowers, and K. jasminea, which has elegant white jasmine-like flowers. —V.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CYCLAMEN AT REST.—A. C., Norwich: There is no need whatever to shade the cyclamen that are being rested in a cold frame.

NEMESIA STRUMOSA.—A. C., Norwich: If the plants are strong, sturdy, and well hardened, set them out eight inches apart each way, and they will presently fill up the intervening spaces and provide a fine piece of brilliant colouring.

AMATEUR ROSARIAN.—E. F., Huntingdon: The following definition of an amateur is the one governing the competitions of the National Rose Society, and it is also binding on all societies in affiliation with it: No person shall be allowed to compete as an amateur who sells rose plants (except when giving up possession of the place where they grow, and in the case of new seedlings or sports), rose-blooms, or buds for budding, nor any person in the employ of a nurseryman. Any objection raised as to the rightful qualification of an exhibitor shall be referred to the council for arbitration, and their decision shall be final and binding on all parties.

DESTROYING TREE ROOTS.—J. C. B., Gourock: If you will be more explicit we will do our best to help you. At present we do not understand whether it is tree stumps or roots you wish to destroy, and you do not give us any information regarding the conditions that surround the roots. Give us more particulars, and say whether the trees, the roots of which you wish to destroy, are in your own or a neighbour's garden.

MANDRAKE.—E. D., Macclesfield: The mandrakes or mandragoras are not of sufficient merit to secure a place in gardens, but they are of botanical and mythological interest, while the poisonous roots possess a narcotic principle, and were at one time regarded as of some medicinal value. Mandragora officinarum (or M. vernalis) is the medicinal mandrake, and it is a native of the Mediterranean district, from whence it was introduced in 1548. This may be propagated by means of seeds sown in sandy soil in a cold frame in spring, the seedlings being planted out as soon as large enough. Old plants may be divided in autumn or March, and stock is easily increased in this manner. Mandrakes like deep light soil, and a moderately shaded position. We are not aware that mandrakes are grown in any quantity in any particular part of this country.

DISEASED PLUM SHOOTS. — W. S., Kent: We have submitted the specimens to a mycological expert, and his reply is to the effect that there is not sufficient material to enable him to say what the cause of the death of the pieces of plum stem has been. It is evident the cause must be sought below where the pieces of stem were cut off.

WARTS ON VINE LEAVES.—Our correspondent "G. B." writes: A case of warts on vine leaves greatly puzzled me last year. The vines belonged to an acquaintance, a gardener, who grew and successfully exhibited some of the finest bunches of Muscat of Alexandria that have ever been staged in this country. He declared to me that the vines had been well ventilated, and that the structure had not been kept very moist, and asked if I could give him the reason of the warts forming in such numbers on the undersides of the leaves. My reply was that lack of fresh air was the main cause, but from what he said, the vines had had abundance of it. He is a young cultivator, and is anxious to avoid all drawbacks to the vines. The roots of the vines ramble at will in the natural soil: but so do those of some of my vines, yet the leaves of my vines are free from warts. Perhaps some readers of the Gardeners' Magazine may be able to give other reasons for warts forming on vine leaves than those I have mentioned? If so, their experience would be much appreciated.

YEW HEDGES.—A. C., Norwich: It is not too late to clip yew hedges, but the work should not be deferred long. A hedge may often be greatly improved in the course of a season or two if certain branches are bent down and tied into position over the bare places, and all subsequent growth is also tied into position.

NAMES OF PLANTS.

A. G. G., Southampton.—1, Odontoglossum Rossi majus; 2, Ada aurantiaca; 3, Odontoglossum Adrianæ; 4, Trollius asiaticus.

E. W. A., Newport.—1, Prunus Pissardi 2, Pyrus Malus var.; 3, a good seedling hippeastrum or amaryllis; 4, Coronilla glauca.

B. A., Glastonbury. — 1, Begonia fuchsioides; 2, Lantana hybrida; 3, not sufficient for identification, probably Adiantum æthiopicum.

C. S., Wycombe. — 1, Muscari conicum Heavenly Blue; 2, Odontoglossum triumphans; 3, Cytisus filipes; 4, Selaginella cæsia.

F. K., Aston.—1, Cheiranthus Cheiri; 2, Cydonia japonica; 3, C. japonica, probably the variety Aurora; 4, Arabis albida variegata; 5, Begonia Haageana.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Gresford Rose Society.—Thirty-first exhibition will be held in the Vicarage grounds, Gresford, on Friday, July 8.

Blaenavon Flower Show.—Fourth show to be held in the Park, Blaenavon, on Thursday, August 25.

Cheshire Agricultural Society.—This society has a horticultural section of fifty-three classes; the show will be held on the Roodee, Chester, Wednesday, August [illegible].

Edgware Horticultural Society.—This society offers three challenge cups for roses, two for sweet peas, and one for vegetables: the exhibition will be held at North Lodge, Edgware, on July 16.

CELERY LEAF-SPOT.

According to the Board of Agriculture, "Celery leaf-spot" caused by Phyllosticta apii (Halsted) was first observed in the United States in 1891, and since that date it has repeatedly proved to be a destructive parasite on celery. The foliage is the part attacked, and the disease is readily distinguished among the several leaf parasites of celery by the presence of one or more large blotches on a leaf. These blotches are at first dull brown, afterwards paler, dry, and studded with numerous black points or perithecia, each containing numerous very minute spores. When the spores are ripe the dead portion of leaf on which they are produced crumbles and falls to the ground, carrying along with it the spores of the fungus, which infect the soil and prove a menace to following crops. Numerous spores are also liberated at the moment of maturity, and are conveyed by various agents to adjoining leaves, by which means the disease spreads with great rapidity during damp, dull weather. During 1909 this fungus appeared in Sussex under the form of an epidemic in a field of celery, and much injury was experienced.

A second celery leaf disease caused by a parasitic fungus called Septoria petroselini, Desm., has been long known in this country and on the Continent. In this instance the leaf becomes studded with numerous small, irregularly angular brown spots, each bearing a few very minute black points or perithecia, containing myriads of very slender needle-shaped spores. As a rule, when this fungus attacks celery an epidemic results, due to the rapid production and dispersal of spores.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The Temple Show.

Rumour has of late been sufficiently busy in suggesting that the great exhibition which has been held by the Royal Horticultural Society in the gardens of the Inner Temple during the past week would be the last of the Temple Shows, to induce some who are not careful in differentiating between supposition and fact to regard the matter as practically settled. This is not the first time rumour has been busily engaged in declaring the Temple Show then being held the last of these remarkable and eminently successful gatherings. The exhibition just held may be the last of its kind in these historic gardens; but we do not pretend to be conversant with what is in the minds of the Benchers of the Inner Temple or the Council of the Royal Horticultural Society, and as we appreciate the value of the old axiom, which declares that "It is not safe to prophesy until you know," we offer no opinion on the matter. There are undoubtedly disadvantages associated with the gardens as a place for the holding of horticultural exhibitions on a large scale, and the greatest of these is an insufficiency of space, for which, unfortunately, there is no remedy. On the other hand, they possess several advantages, and one of the most important of these is their unique position in the centre of London, where they can be readily reached from all sides. Twenty-one years have elapsed since the first of these exhibitions was, by the courtesy of the Benchers of the Inner Temple, held in their gardens on the Thames Embankment, and those who take an active interest in horticultural affairs will agree with us that the Temple Shows have had an enormous influence for good on the fortunes of the Royal Horticultural Society, and have materially contributed to the greatly increased interest in gardening within recent years. It is a point of considerable practical importance to remember that while the Temple Shows have increased by leaps and bounds in usefulness and popularity, many of the provincial exhibitions that once held a high position as aids to the advancement of horticulture have declined in public favour, and, in calling this fact to mind, we would suggest that it might be well to consider whether a change in methods of procedure would not, in some other cases be advantageous. The positions of the Temple and provincial shows are not strictly analagous, but for some time previous to the institution of the former horticultural exhibitions held in London had ceased to be financial successes. Therefore, if the Royal Horticultural Society, by a change of policy, has made its exhibitions successful, it is not unreasonable to infer that a careful change in policy would in other cases prove more or less beneficial. The policy of the Royal Horticultural Society, as regards its spring and summer exhibitions is not to encourage competition for so many plants or cut flowers of specified kinds, but to give cultivators an opportunity of exhibiting the plants or flowers in which they are specially interested, and of presenting them to public notice in such manner as they consider the most desirable. How far a similar policy could with advantage be adopted in provincial centres could only be satisfactorily determined by those fully acquainted with local conditions, but in all cases it would be prudent to make such changes as appear advisable in a gradual manner. Under the new policy that was adopted by the Royal Horticultural Society, concurrently with the founding of the Temple Show, the exhibition of orchids has increased at a rapid rate, and the glorious display that is annually produced by the numerous collections of these fascinating plants constitutes a feature of such surpassing beauty as to at once appeal to visitors, whatever may be the trend of their taste. The interest associated with the orchid collections is greatly increased by the fact that whereas at the earlier of these gatherings species were strongly represented, they are now almost superseded by the many beautiful forms that have been created by the activities of hybridists. The hybridisation of orchids had received attention some time previous to the holding of the first of these shows, but the number of hybrids that had then flowered was not great, but now they are so numerous as to form, with the finer varietal forms of the more beautiful cattleyas, nearly the whole of the numerous collections that have proved so immensely attractive to the visitors. Another feature of commanding importance has been that formed by the collections of hardy flowers, which this year have been particularly well shown. In some instances both plants and cut flowers bore evidence of overcrowding, but the crowded arrangements to which we have referred on some previous occasions were much less common than usual, and by far the larger number of collections were staged with much taste. The improvement in this respect was so great that exhibitors may be heartily congratulated on the success of their endeavours to present their favourites to public notice in such manner as to attract attention, and to give pleasure to those interested in hardy flowers. Roses were, as usual, staged in large numbers, and the groups of sufficient extent to afford scope for the exercise of taste in their arrangement were extremely beautiful. In the several collections the

MR. THOMAS H. MAWSON.

great value of the ramblers for conservatory decoration, when grown as standard, pyramidal, and pillar specimens, was amply demonstrated, and it need hardly be said that the dwarf examples of the hybrid teas, teas, and hybrid perpetuals were well flowered, and highly attractive. As on previous occasions hardy shrubs were admirably represented both as regards numbers and the cultural skill evinced in their development, and they were of special interest, for among them were several that well deserve to be better known than is at present the case. Novelties were also numerous, and of much interest, and these will be described in our next issue, when we shall give illustrations of those of special excellence. In admiring the herbaceous calceolarias and some other of the more popular of the soft-wooded greenhouse plants, it was difficult to repress a feeling of regret that the many beautiful show pelargoniums, which at one time were so highly esteemed for beautifying the conservatory at this season of the year, should have so declined in favour as to have been almost unrepresented. This was a very small matter, and in no way detracted from the exhibition, which amply vindicated the ornamental aspects of British horticulture, and was in every way worthy of the traditions of the society under whose auspices it was held, and reflected the highest credit on all concerned in bringing it to a successful conclusion.

Mr. Thomas H. Mawson, of Windermere, has come very prominently into the front rank of horticulturists during recent years as a landscape gardener and designer of gardens. Though by no means forgetting the claims of natural beauty in gardens, as exemplified by many fine designs in the "natural" style, Mr. Mawson is a lover of the more formal, or Old English style of garden design, and when he has an entirely free hand he provides for sheltering hedges and cosy gardens, where there are formal beds and regular borders of good old-fashioned herbaceous plants. Mr. Mawson has travelled considerably, and he is a capital lecturer as well as a splendid craftsman. On several occasions he has lectured before the Royal Horticultural Society, and his lecture on "Renaissance Gardens," given on October 12, 1909, and printed in the recent issue of the R.H.S. "Journal," is well worth perusal, as it indicates his trend of thought and the inspiration that so largely guides him in his work of designing gardens. Mr. Thomas Mawson is an Honorary Associate of the Royal Institute of British Architects.

Floral Tributes to the memory of King Edward VII. were, as we indicated in our issue of May 21, numerous and beautiful; indeed, it would probably be quite correct to say that never before has a Monarch gone to his last resting-place surrounded by so many evidences of love and affection. The flowers, the Royal and other visitors who came to pay their last respect to the dead, and the enormous crowds of people who attended the funeral in London and at Windsor, all testified to the warm place King Edward held in the hearts of his own people, and in the hearts of his neighbours. There were nearly five thousand floral tributes altogether, and every one sent has been, or will be, acknowledged. They were set out round St. George's Chapel, Windsor, in the Dean's Cloister, and on the Cloister Garth, and here they were inspected by many thousands on Saturday, Sunday, and Monday last. Though the flowers have faded, the good deeds of the King will not soon fade from the memory of his subjects, and though necessarily there must be a period during which black will be worn by many as a sign of mourning, we feel that if coloured blossoms are now permitted in floral tributes of respect, then a reasonable amount of colour in dresses will not mean disrespect. Mr. Bernard Shaw's suggestion that a rosette or band of purple or black would be a suitable sign of mourning strongly appeals to us. Those who would refrain from the wearing of a coloured flower in their buttonhole, or banish coloured flowers from their homes and tables, or allow this beautiful late spring weather to pass without putting their gardens, balconies, and window boxes in order for the season, neither honour the dead King nor show respect to King George V. We know that King Edward loved his gardens, and delighted in bright and beautiful flowers, and we should, therefore, do all we can to brighten home and garden with the products of the florists' genius and the skill of the horticulturist, feeling sure that the late King would have wished it so. The time has now come when we should face once more the tasks of everyday life, and if we do this in the spirit which animates the gracious message of King George to his people, we shall not only testify in the best possible manner our respect to the memory of the late King, but shall honour our present King and do that which is best for ourselves as individuals, and for the nation as a whole.

Gardens in the Dukeries.—In the issues of the "Gardeners' Magazine" for June 11 and 18 we shall give an illustrated account of some of the more noteworthy gardens around Worksop and Ollerton, Notts. These will include Welbeck Abbey, Rufford Abbey, Clumber, and Thoresby Park.

Bushey Park Chestnuts.—The famous avenue of horse chestnuts in Bushey Park fully retains its popularity, and many thousands of dwellers in London and its suburbs have taken advantage of the opportunity for again enjoying the glorious display of flowers the trees annually produce. We have seen the flowers rather better in some previous years, but they suffered less from the unfavourable weather that was experienced early in the month than might have been expected, and the myriads of spikes produced a most beautiful effect. The avenue has a length of rather more than a mile, and a width of 150 feet; originally the road down the middle was 60 feet, but is now only half that width. The chestnuts which form the two inner lines of trees are 40 feet apart, and the number of trees is 274. Behind them are four lines of lime trees on each side. The avenue was formed from plans prepared by Sir Christopher Wren, and the trees were planted in the autumn of 1699, at a cost of £3,300, this expenditure including the making of the road.

Miss Willmott's Book on Roses.—Messrs. Henry Sotheran and Co. announce that Miss Willmott's great work on the roses of the Old and New Worlds is on the eve of publication. The title of the book is the "Genus Rosa," and Miss Willmott has been assisted in its publication by Mr. J. G. Baker, V.M.H., F.R.S., the Rev. H. N. Ellacombe, and the late Rev. C. Wolley Dod, and it has been revised by Professor Sargent and Colonel Prain, F.R.S. The work will contain one hundred and twenty-nine coloured plates, in addition to fifty-six drawings of fruits in black and white, with corresponding letterpress, giving the scientific description in Latin and English, the full synonymy, and detailed information relating to each rose. In addition there will also be an illustrated glossary and index. An account will be given, with illustrations, of the most distinct and interesting species of the roses of the Old and New Worlds; some natural hybrids and a few first crosses and old garden roses, necessary to the complete treatment of the subject. The edition will be limited to 1,000 copies and will be completed in from twenty to twenty-four parts, which will be issued at intervals of one month, at the price of one guinea net per part.

Tulips at Thames Ditton.—For a long series of years the extensive nurseries of Messrs. Barr and Sons, at Thames Ditton have been famous for their annual displays of tulips, but this year the firm appear to have surpassed themselves in connection with these attractive flowers. Certainly in no year has there been a more extensive or varied display, or the flowers more remarkable for their high development. Our readers need not be told that Messrs. Barr and Sons have devoted special attention to the May-flowering tulips, or that they have been highly successful in discovering fine old varieties that had practically passed out of cultivation, and in introducing new varieties. But it is well to bear this in mind, because it enables one to more readily understand that the collection is remarkable for its comprehensive character, as well as for its demonstration of the value of tulips as aids in beautifying the garden. The collection of "Cottage" or May-flowering tulips is so large that it contains all the finest of the varieties in their several shades of colour, and the Darwins, which also bloom in May, are equally well represented. It would be interesting to give the names of the best in each group, but the pressure on our space is very great at the present time, and we shall not fail in the interests of our readers to take advantage of our notes when the planting season arrives.

New Echeverias.—Dr. J. N. Rose and Dr. C. A. Purpus have recently described and figured three new species of echeveria discovered in Southern Mexico. It is believed that two of these—E. gigantea and E. subæpina—may be of considerable horticultural value, and useful in the summer flower garden.

Saturday Half-holidays. — A correspondent of the "Journal" of the British Gardeners' Association addresses an appeal to head gardeners for the adoption, where possible, of the half-day holiday on Saturdays. He writes: "Last year we adopted in the gardens over which I have charge the following scheme, and at the end of the season it was found to be quite practical. From April 1 to October 31 the men came to work one half-hour earlier each morning (so that no time was lost) and left work at twelve o'clock on Saturday. The duty man kept at work Saturday afternoon, but as each man took his turn it enabled them to have three Saturdays off and one on. From a working point I found the half-hour in the morning was worth a great deal more in the garden than the three hours at the end of Saturday, and personally consider it a great economy of labour. The men like it very much, as it enables them to get right away Saturday and Sunday. Where possible the duty man is on Saturday and Sunday together. This scheme could be adapted to almost any garden, large or small, and I feel sure that the employer would if it were pointed out to him or her support the idea."

MESSRS. SUTTON AND SONS' FRENCH GARDEN.

For some considerable time past Messrs. Sutton and Sons have devoted a considerable share of their attention to intensive culture, or what is more popularly known as French gardening, and in the experimental culture at their trial grounds of the vegetables and salading best adapted for this method of cultivation they have achieved much success. Those of our readers who attend the fortnightly meetings of the Royal Horticultural Society will remember the fine collection of lettuces, radishes, and other products grown in accordance with the practice that obtains in the market gardens around Paris, that have from time to time been exhibited by the firm. One of these collections we have had the pleasure of illustrating in these pages, and the several exhibits have been referred to in our reports of the meetings at Westminster.

The success achieved at Reading in intensive culture induced one of the principal residents of Birmingham to suggest that a model French garden, arranged in one of the principal parks of that city, would be of great educational value. This suggestion was acted upon, and, with the permission of the Lord Mayor of Birmingham, Messrs. Sutton and Sons arranged a garden in Warley Park, which was open for inspection on the 16th inst. It was visited on the opening day by the Lord Mayor and Lady Mayoress, and large numbers of the general public, including many of the leading citizens, and the numbers who have visited the garden since the date mentioned have been so large as to show that it has created great interest in the city. We have much pleasure in giving herewith an illustration of the garden when visited by the Lord Mayor and Lady Mayoress and the principal citizens.

The whole of the large garden at Warley Park was prepared in sections in Messrs. Sutton and Sons' trial grounds at Reading, and its removal to Birmingham and rearrangement in Warley Park were by no means easy of accomplishment. All difficulties were, however, overcome, and the citizens of Birmingham given an opportunity of seeing a garden on the lines followed by the French growers in working order. The object in view was, it may be mentioned, to show how the amateur or private gardener may, from a limited area of ground, with the aid of hotbeds, inexpensive frames and cloches, produce tender salads and early vegetables in considerable quantity by adopting the intensive system so largely practised on the Continent.

The garden demonstrated the preparation of the hotbed, and showed the use of the cloche for raising seedlings and bringing on the plants. There were beds covered with cloches sown with the four usual crops (radishes, carrots, lettuces, and cauliflowers), and in these the radishes and lettuces were quite fit for use. Other beds contained cabbages and cauliflowers which had only been planted six weeks, the former being quite ready for use, whilst the latter showed signs of soon "turning in." Amongst the cabbages and cauliflowers were endive, radishes, and turnips. There were examples of tomatoes and vegetable marrows as successional crops, and under the cloches the plants of the two last-named kinds were in bloom, and these, in the usual course, produce fruits much earlier than plants grown without protection. Under other cloches peas were in bloom and setting their pods, and there was also evidence of the value of these protectors in accelerating the flowering of strawberries. In the frames were melons setting their fruits, strawberries were rapidly colouring, and the four usual crops in a more forward state than were those under the cloches.

The garden was throughout of great interest, and the success achieved is deserving of much praise.

MESSRS. SUTTON AND SONS' FRENCH GARDEN AT WARLEY PARK, BIRMINGHAM.

Androsace coronopifolia—It is strange that so elegant and charming a little plant as this easily grown biennial is not made greater use of in gardens. One sometimes sees a little patch of it on a rockery, and plants in pots are often included in exhibits of rock plants, but its merits are sufficient to warrant more than this. The plant makes an extremely good edging to beds of spring flowers, and it may also be used to great advantage as a carpet to beds of muscari, or other bright-coloured flowers of similar height. The neat little umbels of small, satiny-white flowers are sweetly pretty, shimmering in the breeze of a bright spring day, and though fragile in appearance the flowers remain attractive for a considerable period. Seed sown in June will produce good plants for putting out in autumn, and when once a stock is obtained it may be maintained with ease, as the plant seeds with great freedom, and self-sown seedlings will appear in any quantity if the surrounding soil is left undisturbed.—M. A. C.

LATE-FLOWERING PHLOXES.

The phloxes of the decussata group are certainly in the ascendant at the present day, and the varieties in cultivation constitute quite a host in themselves. While one can but express satisfaction that they are so popular, the fact remains that in many gardens they do not usually receive the necessary attention to bring them to perfection.

Often the phloxes are grown in hot, exposed borders, where they lose foliage and vitality, as well as suffer the ignominy of producing inferior trusses and blossoms. A dry soil will give a short flowering season and lustreless flowers. Experience has proved that a retentive, well-worked soil will give the finest plants, while if the phloxes can be grown by the waterside, allowing them the moist conditions which we generally give to the Japanese irises, lythrums, astilbes, and similar moisture-loving subjects, they will revel in it.

Probably there is no plant that suffers more from being allowed to stand in one position for a long period than these late-flowering phloxes, and where it is possible I would advise raising a new stock from cuttings every year, and destroying the older plants after the second or third year. This method will ensure the perennial possession of fine and healthy plants. As an illustration of the value of young stock I may state that I have usually cut the finest trusses from those raised from cuttings in early spring, and planted out as soon as ready. The result has been that these youngsters, with a clean, healthy, single growth, and full of youthful vigour, have grown away rapidly, and have produced in late summer the finest trusses of the year, fit for high-class exhibitions.

In several gardens I know phloxes are grown by themselves in prepared beds and borders, and certainly where a blaze of colour is desired a border of well-grown phloxes will furnish the required feature. But for preference I like them best of all in the vicinity of the stream or water garden, where, in company with less ornate subjects, and the harmonising influence of the water, and soft effects of the surrounding greenery, the phloxes are certainly glorious to behold. The glowing colouring loses somewhat of its brilliancy amid such associations, but its loss is really a gain, for the phloxes show up soft, clear, and decided, each variety at once distinct and beautiful. And the foliage (for well-foliaged stems are the making of them) in the waterside position is deep green, strong, and clothes the stems so well that there is a startling difference between them and their "seared" brethren in the dry border.

TEMPLE SHOW—A FINELY GROWN SCHIZANTHUS,
Exhibited by Messrs. Garraway and Co., Bristol.

With the host of phloxes in cultivation at the present time, and the frequent additions that are made to the number by the French and other raisers, one is apt to grow bewildered in the choice of varieties for the garden, and unless one has the opportunity of seeing and judging the merits of the newer forms, it would be an extremely hazardous task to make a selection. This is especially true of phloxes which come under the blue, purple, lilac, mauve, and violet colours, for unless one can make one's own selection of forms that come under these headings disappointment will assuredly follow.

Two of the best varieties which come under this grouping are Iris and Lord Rayleigh, both rich, yet pleasing, hues. A good dark purple-violet is represented in the newer Tenebres, while the mauve-coloured Sinbad is rendered more pleasing by the possession of a bright carmine eye.

It would be a difficult matter to name the best white phlox. The old favourite Mrs. Jenkins has had its day, and one must seek further if they want a first-class variety. Independence has the strong robust character needed, and the blossoms are pure, and the trusses good, but one looks for something a trifle better. F. G. von Lassburg is one of the finest whites, though one would rather favour the new Dutch variety, St. Moritz, which is of large size, strong growth, and snowy whiteness. Of other whites one can always commend Sylphide, which invariably produces good trusses, and comes amongst the earliest in blossom. Those dwarf whites, Tapis Blanc and Helene Vascarisco, produce splendid trusses, but, in my opinion, it would be far better if they were double the height they are.

Coquelicot and Etna have for long held the leading positions among the orange-scarlet hues, so that one has come to look upon them as indispensable in the garden. The newer Chardonneret, however, will prove a formidable rival; it is a very bright scarlet, with large blossoms. Fire King, too, should be noted as a bright telling colour, and Starlight is a good orange-scarlet of a rather softer hue than Etna.

Pink and bright rose-coloured phloxes are always in demand, and the new rosy-hued George Schneider, with its white centre, and grand blossoms, will meet with wide approval. Meteore, a new pink with white eye, is a serviceable variety. Other recent pinks include Selma, clear pink, with red eye; Sonnenkind, a deep rose; and Ironie, a notable pink, shaded salmon, which is very effective. The favourite Pantheon is still a good recommendable variety, while Le Soliel, although rather small, is very much grown.

Other phloxes of great merit are Josephine Gerbeaux, white and carmine; Jarry Desloges, violet, with a large white centre, M. Lucien Chaure, a good novelty, carmine, suffused soft vermilion, violet centre; Welleda, a giant-flowered rosy-salmon, with violet tintings, and a clear white centre; Jocelyn, a bright orange, with purple centre; and Etoile de Nancy, a clear white, with a distinct rosy edge, and bright carmine centre.

Many of the older standard varieties are still grown in large quantities, and some of them are still of service. One might mention such sorts as R. Wallace, William Robinson, Eclaireur, Jeanne d'Arc, and several others which the majority of gardeners are well acquainted with, as an instance of the value of useful varieties, even if they have been in service for years.

P.

RHODODENDRON INDICUM VAR. KÆMPFERI.

Though this plant is placed as a variety of Rhododendron indicum, it appears to be distinct enough for specific rank, especially for garden purposes, for it is very different from the plant which is so well known in our greenhouses as the Indian azalea. It was described by Maximowicz many years ago, but does not appear to have found its way into gardens until Professor Sargent, of the Arnold arboretum, collected seeds on the Japanese mountains some seventeen or eighteen years ago. Kæmpfer's variety differs from the well-known Rhododendron (or Azalea) indicum by having more wiry growths, with smaller leaves and flowers, its most close relative apparently being the old purplish-flowered R. amœnum or Azalea amœna, as it is more frequently called.

When grown out of doors it forms a low, dense bush, made up of innumerable thin branches, clothed with small evergreen leaves. Each branchlet bears a terminal head of brightly-coloured flowers during early May, the flowers on different plants being red or purplish in colour. For the milder counties it is an excellent subject to plant as a mass in a conspicuous position, for few shrubs are more showy or floriferous. It cannot, however, be said to be altogether satisfactory in places where late spring frosts are experienced, for though it is perfectly hardy so far as winter frost is concerned, a frost about the end of April or early in May is almost certain to injure the flowers and young shoots. It is, however, well worth consideration as a cold greenhouse plant in such localities.

K.

"LOOK AROUND YOU."

Visitors to the Temple Show expect a revelation, and, once again, they are witnesses to it. Whether impressed the more with the visible tokens they observe of Nature's resurrection after the white sleep of winter, or with the skill that is needed to produce and bring to simultaneous perfection such marvels of floral beauty and fragrance, the revelation is no less a wonder and admiration.

Mostly, however, it is to-day's result that is matter for concern. The long yesterday of toil and anxious waiting that have led up to so successful an issue is scarcely thought of; so great is the bewilderment of colour, so overpowering are the odours of the flowers, that the mind of the visitor has no place for other reflections. But the workers know, although they find reward for it all in the delight afforded the beholder by the varied charms and attractions of the display.

"If you would seek us i' the Garden" is as pretty and quaint an invitation as it is classic. We are all there: some to seek, others to reveal. The flowers are there in delicacy of hue, in rare fragrance, fair of form. So also are the fruits of the earth, in all the attraction of perfection, abundance, and taste.

So, too, is the unseen force that has helped to produce such effects. Into the soil in which these plants have grown and matured, vitality and energy have permeated that have been as germs of life and health to them—unceasing in operation, if silent in action—and flower and fruit, and vegetable, too, are eloquently mute testimonies that the right manurial element has been used for the development. So that, "if you seek us i' the Garden," we are there, not indeed to sight, but essentially so. "Look around you," and the occupants of tent after tent, the specimens in the groups, the leafy denizens in the gardens without, bear generous tribute to CLAY'S FERTILIZER.

This is not the only attestation, of course, Other gardens tell the same story. The nurseries devoted to horticulture as commercial enterprises bear similar record, and, if such extensive areas are made to rely for results upon the service of CLAY'S FERTILIZER, so also may the reader of these lines, whether he is responsible for the cultivation of many acres, or whether he finds the delight of his leisure moments in the more limited enclosure adjacent to the country or suburban home.

CLAY'S FERTILIZER is so convenient for use that all may employ it. It is more, for it is really potent. One user, who has charge of the gardens of a stately castle, writes: "It is safe and sure." Another states that "it is reliable and quick-acting." Lengthy lists of prize-winners rely upon it for the attainment of their certain awards.

To ensure CLAY'S FERTILIZER for every user with all its forces unimpaired and without suspicion of adulteration, the utmost precaution is taken, and purchasers are earnestly requested to obtain the preparation exactly as put up by the firm.

Every Tin that leaves the Works bears the TRADE MARK. Every Bag is BRANDED with this high mark of purity and quality; and it is also SEALED, each SEAL being impressed with the distinguishing token. So handed to the buyers CLAY'S FERTILIZER is Guaranteed by the Proprietors. It is sold by Seedsmen, etc., everywhere, or it may be had from

CLAY AND SON, STRATFORD,
LONDON, E.

CLAY'S SUCCESSFUL GARDENING,

Fourth Edition (Reprint), is the best Handbook of its kind for the gardener. The most Eminent Writers of the day are its contributors, and its Contents, which are full of information, are authoritative. The reader will find much that will help him in the arrangement and culture of his Garden, and special articles appear in it upon Begonias, Carnations, Chrysanthemums, Daffodils, Dahlias, Lilies, Roses, Sweet Peas, Violas and Pansies, and Bulbs. Thus the Flower-lover has much to interest and instruct him. For the Fruit Cultivator there are suggestive contributions upon the cultivation of Cucumbers, Melons, and Tomatoes for Profit.

Indoor Gardens, Suburban Gardens, Rock Gardens have their various sections, and the intricacies of practical work are simplified by means of detailed descriptive and outline sketch.

You may immediately declare war against the world of Insect Pests if you but follow the directions for their extermination given in the book; and, if you desire your work laid out for you as you take your daily fare, there is "Work for Every Month," and plenty of it. Such interesting memoranda as "Hints upon Sowing Flower and Vegetable Seeds," a list of flowers that are Fragrant, and of others that are Poisonous—in the latter case antidotes, suitable for use in the event of a doctor not being available, forming a valuable and exclusive domestic companion in distressing cases where vegetable poisons have unwittingly been taken.

For the Exhibitor there is a complete vade mecum provided in the noticeable contribution by the veteran journalist and judge, Mr. John Wright, V.M.H., entitled "GROWING AND SHOWING." If a life-long devotion to horticulture and a repute of the highest be a qualification, then here is the writer and here his work. Points for Exhibiting and Rules for Judging are stated and developed with admirable judgment and deliberation.

Growing for Market and The Use and Abuse of Manures serve mainly for the edification of the Market grower, whereas Floral Decorations, the attractive occupation of preparing which is the lighter side of home activity, are treated of in the interest of everybody with a soul for a flower.

The book is published by Messrs. CLAY AND SON, the Proprietors of CLAY'S FERTILIZER, Stratford, London, E., and its general form and get-up brings to you a volume of 276 pages, neatly bound in green cloth. There are many illustrations, either as full-page pictures or as engravings in the text, and your seedsman or nurseryman will hand it to you for the small sum of NINEPENCE; or, if unable so to obtain it, you may have it placed upon your table, post free from the publishers, by sending this amount to them direct, addressed as above.

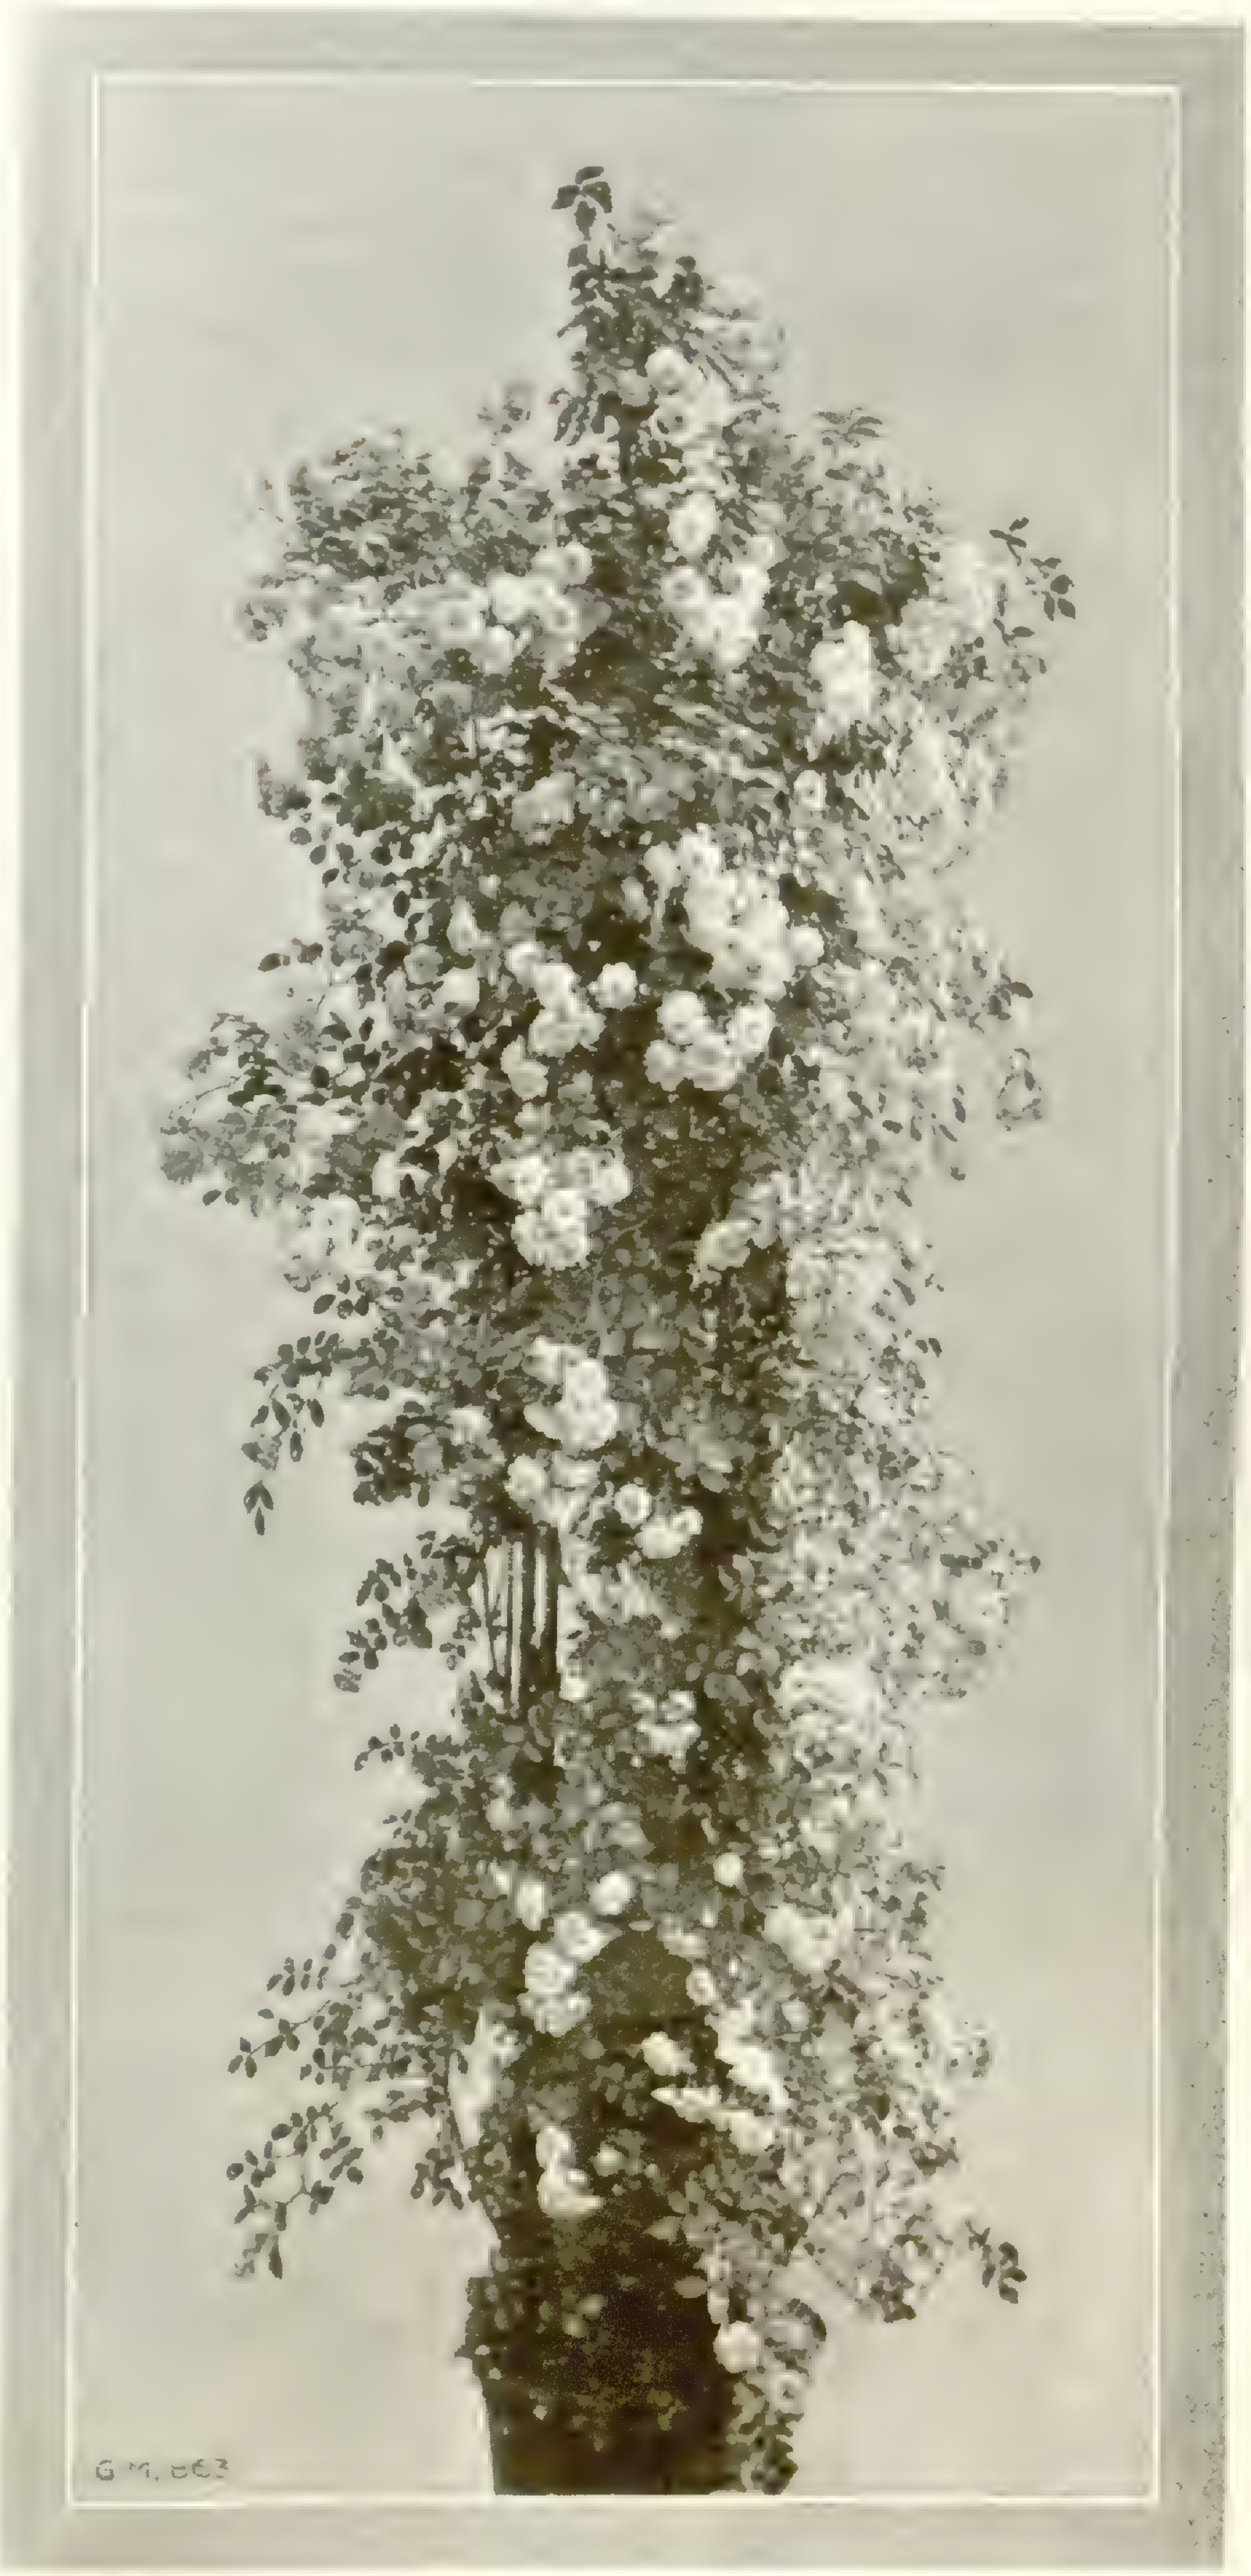
THE MICROSCOPIC PLANT WORLD.

The unaided human eye is very limited in its scope, and only endowed by evolution with the power of conveying to the brain a comprehension of the larger items of its environment. Nature, however, using the term as figurative of the great Creative Power underlying everything, embraces two immense realms outside such optical scope, viz., the realm of the infinitely great and that of the infinitely small. Man, endowed with the marvellous gift of an intellect, has found means to grapple with both of these, to a certain extent, the telescope and spectroscope enabling him, so to speak, to dissect and analyse the vast universe of the stars, while the microscope has permitted him to investigate the world of the minute in the midst of which he exists.

In this latter direction he has learnt that though he probably is alone gifted with an appreciation of the beautiful, there exists an infinity of beauty which cannot be considered as in the remotest degree designed for his delectation, since it is practically of very recent discovery, due to improvements in the instruments employed. Hence it may be reasonably assumed that countless myriads of mankind have in the past been entirely ignorant of its existence, while even to-day it is comparatively very few people who really comprehend the marvels which underlie the surface of what is seen by the unaided vision. We have spoken of the infinitely minute in this connection, and done so advisedly, since the greater the power of our microscopes the wider the horizon becomes which remains to be reached, only in such event to find fresh ones in the distance. When the microscopist has reached his limits, the mathematician comes in, and demonstrates that, inconceivably far beyond his ken, there lies the ultimate molecule, primary atom, ethereal unit, or whatever else it may be termed, billions of billions of which may be embodied on the tiny point he has managed to discern with his highest magnifying power.

It is precisely here, as in the celestial universe, the farthest visible nebula being resolved by the most powerful telescope, faintly, but unmistakably, the more sensitive photographic film will show an infinity of others beyond. To come now, however, to our special theme, we may cite in the first place the microscopic fungi, the blue moulds and others, the spores of which teem in our atmosphere, and are practically ubiquitous wherever organic material exists to enable their colonies to be formed. To the naked eye they are mere patches of discoloration, but under the microscope these patches resolve themselves often into growths of extreme beauty, symmetrically branched, and bearing fruit in the shape of spores arranged in bunches, festoons, or in other ways, so that the tiny patch is seen to be a forest of charming vegetation, bearing such harvests of fruit as no tree of larger growth could rival. Probably every patch chosen at random on different substances, damp wallpaper, old cheese, rotten wood, and so forth, would display an entirely different landscape in miniature, for their name is legion. We may next turn to the diatoms, which certainly rank among the most wonderful examples of hidden beauty.

Here, despite the pure crystalline flints of the beautiful forms which they fashion, we are dealing with an absolute vegetable, and the wonder of it is that, though many thousands of beautifully varied designs are shaped by these organisms, each one is but a mere blot of jelly-like consistency. Within this, during its life, each one according to its kind, secretes, taking a cyclodiscus as one of the innumerable types, a perfectly circular disc of the purest crystal, its surface worked radially with most charming patterns, its edge rimmed and bossed, and, in short, a perfect glass salver, ornamented in such an artistic style as no glass cutter could excel. The more highly magnified the more detail appears, and yet, so minute is the field upon which this work appears, that, individually, it is quite invisible except under a high-power lens, and a thousand or two spread over a microscopic glass slip appears but as a faint dimness. An additional wonder in this connection is the immense abundance of these microscopic artists. Every pond and ditch has its myriads, they abound practically in all waters leaving a sediment, our home aquaria may teem with them, and in many parts of the world they even form geological strata.



TEMPLE SHOW—ROSE LADY GAY.

A finely flowered specimen of this rich pink Wichuraiana, shown by Messrs. Paul and Son, Cheshunt.

We conclude with a more familiar field, viz., the pollen of our flowers. Mere dust as this seems, every grain is a beautiful creation; spread a few of them on a glass slip, and view them under even a lens of moderate power, two or three hundred diameters, and the result, we are sure, will be further research into this infinitely interesting realm of the smaller plant world.

CHAS. T. DRUERY, V.M.H., F.L.S

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CATTLEYAS.—The majority of the cattleyas and allied genera will, at the present season, be in a more or less active state of development, either new growths are being produced, flowers are advancing, or the new roots are pushing from the base of the last made or new growth. Thanks to the endeavours of the hybridists development is with us at all times. Instead of cattleyas having a flowering season extending over a few months in the summer and late autumn, we have plants giving us a continuous supply of flowers throughout the whole year. This serves to indicate the constant attention necessary to provide the conditions best suited to the requirements of the different species, and of the hybrids and bi-generic hybrids that have become so plentiful. Cattleya Mossiæ, C. Mendelli, and the numerous early summer kinds are this season nearly a month later than usual. The unfavourable conditions outside that have been so continuous throughout the whole of this year accounts for their lateness in flowering. As soon as the early flowering cattleyas pass out of flower they usually commence active root action, and therefore any repotting that is necessary should be attended to as soon as the flowering season has passed. It is not advisable to repot cattleyas and their allied genera for the sake of repotting. If the potting compost is in a good state of preservation, and there is ample root space in the pots, all that is necessary is to remove any dead or decaying material on the surface, and replace it with good living sphagnum moss. If repotting is necessary carefully remove all the old potting material; when this has been done the rhizome will be fully exposed; it will be noted that when there are numerous back pseudo-bulbs they will have lost practically all their roots, and are thus dependent for support upon the younger portion of the plants. It will thus be only reasonable to assume that these rootless pseudo-bulbs are likely to be detrimental to the young growths, and there can be no doubt that plants of some age diminish in vigour unless the rhizomes have been severed. As many of these back pseudo-bulbs have dormant eyes capable of producing new growths, it is desirable they should be removed by cutting the rhizome asunder between the pseudo-bulbs about two or three bulbs back from the lead. The pieces thus divided may be put in small pots, with ample drainage, and, in due course, they will usually produce new growth. This is one method of increasing the stock when so desired.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—Most of the plants should now have their final potting, an operation that takes some time and should not be hurried, as this detail requires careful attention. The best size of pot to be used is a matter of opinion, and some varieties do better in a smaller size than in a large one. For general purposes 10-inch pots appear to me quite large enough, and even a size smaller will allow ample rooting space for many varieties. If smaller sizes than these are used, it causes additional labour in watering and feeding during the summer months. The crocks and pots should be thoroughly cleaned and dried before using and care must be taken in arranging the drainage material in order to provide the best possible outlet of water. A thin layer of fibrous loam should be placed over the crocks to prevent the finer soil running down between them and checking the escape of surplus water. The potting soil should have been turned over several times to ensure the constituent parts being well mixed together. Let the potting be done as firmly as possible, taking care not to break the ball of roots. After the repotting place the plants in a shaded position for a few days, and spray overhead to prevent the leaves flagging. Subsequently remove to their growing quarters, and provide each with a label on which should be inscribed the date of potting as well as the name.

CYCLAMEN.—These should be removed to an unheated frame, remembering that sunlight is necessary for their well-being. The foliage should not be exposed to very bright sunshine, therefore matting or some light covering should be at hand for shading when necessary. Keep the surroundings moist, or thrips may attack the foliage and do much damage.

FRANCOA RAMOSA.—Old plants of the Bridal Wreath are now pushing up their flower spikes, therefore some support should be given to keep them straight. The plants will derive benefit from applications of liquid manure. Young seedlings should now be pricked off into boxes; afterwards, when large enough, pot them off singly, using 2½ or 3-inch pots, and good fibrous loam, with leaf-soil and sand.

PRIMULAS.—The plants raised from early sowings will be ready for shifting into their flowering pots, using good loam with a moderate proportion of peat added, and leaf-soil; syringe overhead every afternoon, and shade from bright sunlight.

HIPPEASTRUMS.—Plants that have finished flowering should be exposed to full sunshine. Do not hasten the ripening of the bulbs by withholding water, but rather keep them moist, and give them ample ventilation. Applications of weak liquid manure will be beneficial until the decay of the leaves. Care must be exercised to avoid excessive waterings. Young seedlings now ready for potting off singly should be put in 2½-inch pots, using loam, leaf-soil, and sand. Syringe twice daily, and maintain a moist atmosphere.

MANURE.—Most plants are growing freely, and require some manurial assistance, but liquid manure should not be given to plants when the soil is very dry. Whatever the nature of the liquid, it is necessary to be cautious in its use. Dilute it liberally rather than have it too strong. Sheep manure steeped in a barrel with a six-inch potful of soot put through a fine sieve, and well mixed makes a capital liquid, and may be applied twice weekly.—Walter Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

BEDDING OUT PLANTS, with the exception of the most tender kinds, may now be planted. Taking into account the shortness of our summer season, and the consequent transitory character of flower gardening, where tender plants are used, every endeavour should be made to do without these, or, at all events, to use them as sparingly as possible. Plants used for sub-tropical purposes should not be hurriedly placed out of doors, but gradually hardened to the ever-varying changes of our climate; unless this is done many will not be able to stand the direct rays of the sun without becoming scorched, and thus become unsightly for a very considerable time. Care should be taken that all the plants are thoroughly soaked with water before being turned out of the pots or boxes in which they have been growing, and if the soil in the beds is at all dry another watering should follow after planting. If brilliant sunshine [illegible] vails at the time of planting it may [illegible] necessary to shade some of the plants [illegible] are impatient of undue disturbance at [illegible] roots, and so assist them in making a [illegible] start.

ROSES AND OTHER CLIMBERS [illegible] been somewhat injured by late frosts [illegible] prevailing east winds, and this, it is [illegible] to be feared, will render the plants [illegible] prey to the attacks of green-fly and [illegible] It will therefore be advisable to keep [illegible] sharp look-out for the appearance of both of these pests in order that remedial measures may be at once taken. In the application of these considerable force through [illegible] syringe or garden engine will [illegible] in order to dislodge the greenfly [illegible] spraying with an approved fungicide [illegible] suffice for mildew. Should leaf maggots [illegible] come troublesome, the only sure cure is [illegible] pick them off and destroy the leaves [illegible] they are hidden. All roses that [illegible] recently planted should be kept well mul[illegible] and during dry weather be watered [illegible] Clematises and other quick growing [illegible]

TEMPLE SHOW—SPECIMEN HERBACEOUS CALCEOLARIA.
Exhibited by Messrs. E. Webb and Sons, Wordsley.

will now need frequent attention as to direction of growths and tying or nailing in.

NEWLY-PLANTED TREES.—Attention should be given to all newly-planted trees and shrubs, especially azaleas and rhododendrons, in the way of watering, or the restricted balls of earth in which they have been growing will become unduly dry, and this usually means the loss of the plant. Every encouragement should be given to the roots to penetrate the soil of the beds in which they have been recently planted; mulching the surface of the soil will aid in maintaining a uniform state of moisture and temperature of the soil.

ROSA RUGOSA (Japanese Rose) is now a prominent object on the lawns and shrubberies. This is one of the most vigorous-growing roses, the plants making very handsome specimens with but little trouble. Little or no pruning is necessary, a judicious thinning of the branches occasionally being all that is required. Besides being a free-flowering subject, it has the additional attraction of being usually laden with bright orange-coloured fruits during the autumn and early winter months.

TEMPLE SHOW—ANDROSACE HENRYI.

A beautiful species with rose-tinted flowers, exhibited by Messrs. J. Veitch and Sons, Lim., Chelsea.

GENERAL WORK.—At the present time there is no lack of work, and skilful management as to the work necessary to be done at the right time will be needed to keep everything in order. Hoeing, weeding, clipping verges, weeding walks, the removal of dead or decaying flowers, the staking and tying up of perennials and carnations, the pegging down of violas, and all similar work, tends to preserve neatness in this department if promptly done.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

RASPBERRIES AND LOGANBERRIES.—Thin out the young growths where likely to be overcrowded by pulling them up, leaving only sufficient in number for next year. The young growths of the loganberry should be tied securely to the wires as they develop. The soil between the rows should be frequently stirred with the Dutch hoe, and, where mulching was put on early in the spring, weeds will have become a source of trouble, and it should be lightly turned over with a fork on a bright sunny day. Where these fruits have not been mulched no time should be lost in carrying out this work. Autumnal fruiting raspberries will be greatly assisted in making strong fruiting canes by frequent applications of liquid manure, and at the same time thinning out the young growths sufficiently to allow sun and air to have free access to those remaining, and thus ensure full development. The raspberry beetle, when in the larval stage, is frequently destructive to the fruits of both the raspberry and loganberry, which causes the fruit to become deformed and shrivelled. It is at this time that the beetle lays its eggs upon the flower buds, therefore a sharp look out should be kept, and, if found, they should be caught by placing tarred boards close to the plants, and also by shaking them into cloths, when they should be immediately destroyed.

BLACK CURRANTS.—The bushes should be frequently syringed with quassia extract to combat the mite and aphis. We have been much troubled here this season with the "night" weevil, which eats the foliage and buds upon the bushes. Constant attention has been necessary, to examine the trees at night with a lantern, and placing cloths under the bushes, giving them a gentle shake into the cloths, when the weevils could be caught and destroyed.

GOOSEBERRIES.—The bushes should be watched, and when there is evidence of an attack of the gooseberry caterpillar, it should be promptly and thoroughly dealt with. Dusting with hellebore powder will kill them at once, but as this is poison the fruit must be well washed before use. We have found it a good plan to syringe the bushes—from this time onward—once a week with quassia extract; this undoubtedly wards off caterpillars, and also the trees are kept free from red spider. As a rule the caterpillar is not so troublesome where heavy cow or pig manure is used for mulching the surface of the soil between the bushes.

PEAR LEAF BLISTER.—This is caused by a minute but most destructive mite, which attacks the young foliage at the present time, raising blisters upon the leaves where they have deposited their eggs, and another generation is soon developed. Spraying with an approved soluble paraffin insecticide is the best means to adopt to combat this pest. At this season of the year the small larvæ of the winter moth will be found upon the leaves of the pear and apple trees, and if the leaves appear curled or joined together, the trees should be carefully examined, and the small caterpillars be crushed between the thumb and finger. Subsequently give the trees a good spraying with an approved insecticide.—Henry R. Farmer, Cardiff Castle Gardens.

French Beans.—To be on the safe side a batch of seeds should be sown in boxes or small pots, independently of those sown outside, for, should late frosts occur, these will be found necessary for planting out to prevent a break in the supply.—G. Ellwood.

Marica cærulea.—This is a handsome stalwart of the stove house, and is a native of Brazil, and of easy culture, requiring a rich loamy soil and plenty of water. The colour of its flowers is a pretty blue, and are borne on a long spike some three or four feet high, and continues to bloom for weeks together, the flowers lasting only for one day, but the pleasure one obtains from these plants is very great. Marica Northiana is very pretty and curious, and sweet scented, but Marica cærulea is better in every way. It is very easy to increase. After flowering the plants produce a growth on the extreme end of the flower spike, and these, if pegged down into soil, will soon root, and make useful plants.—W. D. Pope, Wareham.

UNCOMMON GARDENS.

A flower garden is almost sure to be attractive, but there is no reason why it should not be original, as well as lovely, without the expenditure of any colossal sum. May is the last month, however, in which work can be done with regard to a present-season display; pot roses can be still planted, or sunk in their pots until autumn, while late blooming, and some of the more tender herbaceous plants, are suitable for many situations.

A rockery of roses! How fair a picture does this conjure up before the mind's eye, yet how rarely do we see the idea carried out. The higher the banks that are built up with stones on their surfaces the better will the effect be, and not a single rock should be tolerated that is not grey with age, and, if not already mossed, all ready to become so. The numerous Wichuraiana roses, that blossom freely while trailing long branches downwards instead of being trained to wall or trellis, are especially suitable for large spaces; pegged down teas will thrive among the shelter of stones on sunny slopes, and still smaller openings between rocks will suffice for the dwarf polyanthas, such as Red Pet, White Pet, Mignonette, Ma Paquerette, and Anna Marie de Montravel.

TEMPLE SHOW—H.T. ROSE PORTIA.
A charming variety belonging to the hybrid tea section, raised and exhibited by Messrs. W. Paul and Son, Waltham Cross.

Along a short sunny border why should we not place a succession of arbours, to be entered from the path that runs alongside, or by narrow branch paths crossing the border? If the whole is backed by wall or fence this will make a natural foundation for the arbours, but the latter look, perhaps, more striking, when constructed along the centre of an open border. The supports can consist merely of hop poles, or bean faggots, bent over and bound together; there should be poles and climbers to form the backs, of course, of arbours that stand in the open. Pot clematises and roses might be made use of, but young plants of Cobæa scandens, canary creeper, or climbing convolvuluses can be relied on for profuse clothing this summer. The original colonnade of arbours has a beautiful appearance by the side of a tennis or croquet lawn, and will provide nooks in which to set chairs for spectators, or can be furnished permanently with low, rustic, unobtrusive benches.

Small hills greatly improve a garden scene; it is an error to level most of the land when laying out new pleasure grounds. If a hill is of sufficient size to allow a winding or zig-zag path to be made up one side of it, and this is flanked by borders of tall plants, quite a maze-like effect will be gained; annual giant sunflowers would give a speedy result, and shrubs could be put in later. The summit can consist of a grassy carpet, surrounded by evergreens, with an arbour or summer house in the centre, from which attractive views will be gained. Another hill, sown with grass seed from base to top, would be pleasing sown with patches of cornflowers, poppies, corn marigolds, and white double daisies. In autumn gorse, broom, heather, harebells, primroses, violets, foxgloves, bluebells, and wood anemones could be substituted.

Very few gardens show ornamental streams, though many contain pools, yet the former are, in many cases, easier to construct, and have more charm. Wherever a high bit of ground leads down to a lower one a stream can be made; the easiest manner of gaining the water being to connect the head basin with the roof of the nearest summer house, conservatory, shed, or other building, by an underground pipe; this will conduct the rain water, which will generally prove sufficient for the stream. An overflow pipe connected with a drain must be provided at the other end. A concrete base, covered by pebbles, will ensure a clear appearance of the water There is no exaggerating the beauty of a little streamlet when its edges and low banks are well planted with ferns, ground ivy, primroses, violets, periwinkle, and a host of other favourites.

Where there exists an old orchard let it be turned into a floral garden also: round, or better still, irregular shaped, beds cut out between the trees, if the carpet is of turf, should be sown with Lavatera trimestris rosea and alba, the pink and white mallows, with Gypsophila elegans, Shirley poppies, cornflowers, single white clarkias, etc. Permanent plants to introduce afterwards, sure to flourish even under the drip of widespreading branches, will be golden rods, montbretias, mulleins, phloxes, oxeye daisies, honesty, foxgloves, Campanula macrantha, St. John's wort, and the yellow Welsh poppy.

Banks covered entirely by tropæolums are wondrously effective; the climbing kind should be used, to trail downwards as well as to be trained up from the base; there is now seed offered of about seven differently coloured varieties, all of which have cream and green variegated foliage.

Groups of bold plants look best of all when rising immediately out of the lawn; the lemon-yellow sunflower, Primrose, surrounded by the lemon three-feet miniature sunflower, Diadem, makes a fine group as soon as the plants are a foot high the turf can be relaid almost up to their stems, which prevents any soil from being visible at blooming time.

M. H.

Isatis glauca.—Those who appreciate the elegance and lightness of Gypsophila paniculata—and who does not—cannot fail to be equally pleased with the graceful inflorescence of Isatis glauca, which bears a striking resemblance in habit to the gypsophila, but provides a cloud of golden instead of white flowers. It is a good plant, hardy, and most effective when grown in clumps on a raised border. The foliage is of a glaucous green, and with good cultivation the panicles of bloom attain a great size, rendering them conspicuous from a considerable distance. It is a strong rooted thing that is best established by sowing seed, and transplanting to permanent quarters while still small.—M. A. C

JOTTINGS FROM THE WEST.

When the possibilities of the West Country as a fruit-growing district were first discovered I know not, but it was generations before the comparatively modern plantation method was introduced, and, as if to maintain its early traditions, the West remains a land of orchards. Amongst the latter one sees a mingling of the ancient and the modern, in the shape of orchards in which the trees, some standing erect, some leaning over, and some with trunks flat on the ground, look half as old as time itself, and, by way of contrast, one sees also the modern type of orchard planted within the last few years, and in which the trees are properly staked, securely fenced, and set out in straight rows. It is the latter orchard which takes the attention of people who know how fruit should be grown, but the artist finds more to please him in the orchard of ancient origin.

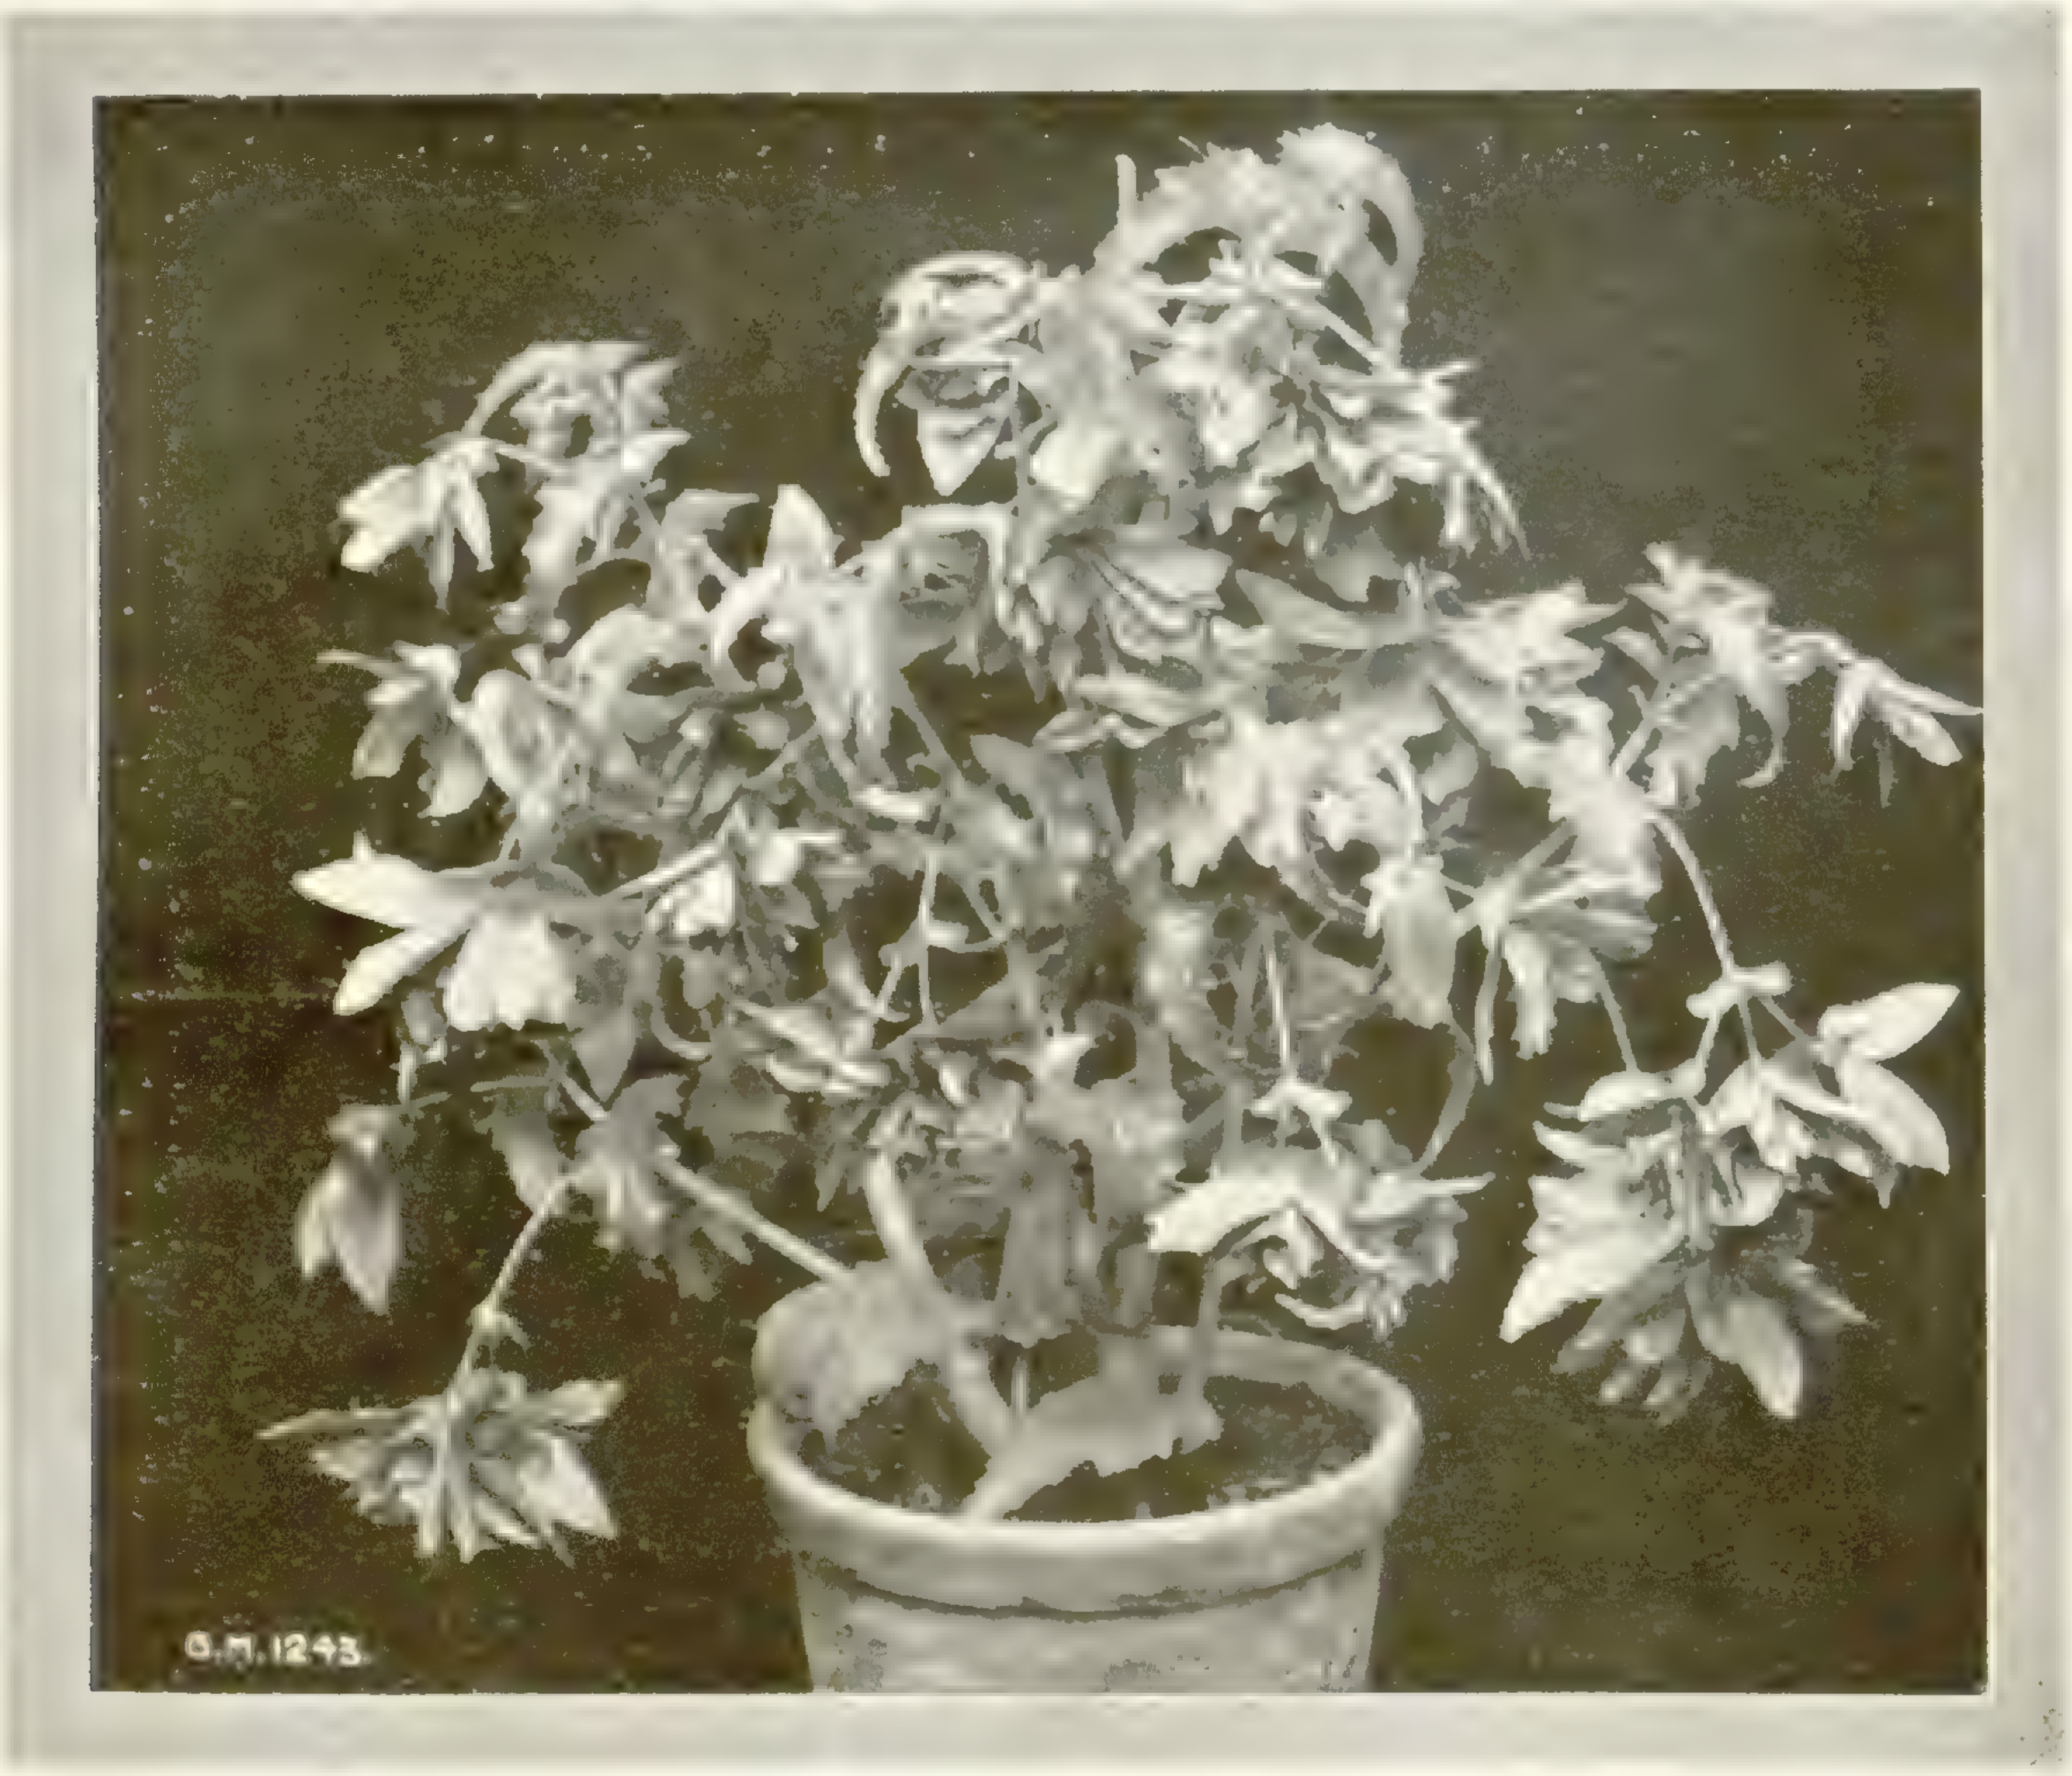
TEMPLE SHOW—DARWIN TULIP REV. H. EWBANK.
A beautiful variety with finely formed flowers of a pleasing heliotrope colour, exhibited by Messrs. Barr and Sons.

I am writing in the month of May, and at this season of the year the West Country can justly boast of its orchards beautiful. Pear trees grow here as they grow in few parts, but they are not the pears of the garden or fruit plantation. Outside the Western counties names like Barland, Butt, Blakeney Red, Moorcroft, and Oldfield are unknown, but these are the varieties from which perry is made, and in the counties of Hereford and Gloucester there are perry pears which in girth and stature are like forest trees. When covered with pearly-white blossoms these mighty specimens are objects of beauty, and their habit of growth lends a particular charm of its own. Not a bit less beautiful than the white blossoms on the pears are the pink flowers on the apple trees, and at the moment of writing the outlook for fruit is very favourable. In West Country orchards one sees varieties of apples that are not known outside the locality, and the names of these are not to be found in any nurseryman's catalogue. The explanation of this is that back in the olden days, when the only object of growing fruit was to make cider, trees were raised from seed, and some of the seedlings bore fruit which made good liquor. That was enough, the apple was named by the raiser, generally after himself or his farm, the fame of the apple spread abroad, grafts were distributed, and the variety became established in the district. Now and then you may come across the trees from which local varieties originated, and antiquated specimens they look, with their hollow stems, twisted limbs, and gnarled branches, but they possess the capacity of blooming as long as a spark of life remains in them, and age and antiquity seem to lend a particular charm in the season of blossom.

Not for one moment did the raisers of good West Country cider apples think that the varieties would ever be collected, classified, and distributed in the form of nursery stock; but even that has come about, and when the National Fruit and Cider Institute was founded a few years ago at Long Ashton, near Bristol, a part of its work was to collect the local cider varieties of repute, propagate them, and distribute trees amongst the contributing counties for the purpose of establishing orchards. These distributions began in the autumn of 1908, and continued in the past season, with the result that some hundreds of trees have been sent out, and a marked impetus has been given to the planting of cider fruit. This is quite as it should be, because, owing to the demand for table fruit, there has been a tendency in recent years to plant dessert and culinary varieties, to the neglect of vintage fruit. One does not, of course, blame the farmer for growing the varieties of apples which bring in the most money, but there is room for both, and many cider casks would be empty and useless if the forefathers of the present generation had not planted vintage fruit.

Not only are trees raised at the National Institute, but cider is made from the varieties collected, and once a year interested persons from the contributing counties are invited to taste the samples. This year the tasters had offered to them some thirty samples of single variety ciders made from the sweet apples of Devon, and the sharp and bitter-sweet varieties of Gloucester, Hereford, and Somerset. Kingston Black, Foxwhelp, Wilding Neverblight, Slack-ma-Girdle, Dabinett, and Twistbody Jersey are a few of the quaint names given to varieties that were tested, and not the least interesting part of the proceedings was the sampling of different blends prepared by Mr. B. T. P. Barker, the able director of the institute, who is recognised in the West of England as one of the best authorities on matters connected with cider making.

"Blight" is a word with a meaning in the West Country, and it is applied in a comprehensive sense to every insect pest which affects orchard trees. Quaint ideas prevail regarding the origin of blight, and there are not a few who think that it is borne on the wings of the wind, like the locusts in ancient Egypt. As a rule, the West Country farmer treats "blight" as one of those evils which cannot be avoided, and he does not trouble to discriminate between woolly aphis, apple sucker, winter moth, and codlin moth caterpillars, and apple blossom weevil, which are his worst enemies. This is perhaps the general aspect; but a change seems to be slowly taking place, and the sprayer has found its way into West Country orchards. As yet it is only a few who spray, and these are the up-to-date men who are tired of leaving so much to chance, and standing the risk of losing their crops. But while a few are going ahead others are sitting on the fence, only waiting to see the results of the spraying before they adopt similar tactics. As an instance, one farmer this year sprayed all his orchards with lime-wash, and the whitened trees gave rise to many critical comments in the district, but, curiously enough, the lime appealed to the critics. Perhaps they remembered that their grandfathers used to whitewash the stems of their trees with some vague object of checking "blight," and, consequently, they were disposed to look more favourably on this simple wash than on the mysterious mixtures prepared by insecticide merchants. Be that as it may, the lime spraying was received with favour, and if it answers there will be more whitened orchards in that locality next spring.



TEMPLE SHOW—BEGONIA LLOYDI.

A remarkably handsome variety with brilliant scarlet flowers, exhibited by Messrs. Sutton and Sons, Reading.

For years past the pruning in West Country orchards has been open to severe criticism. Hundreds of trees have never been touched since the day they were planted, and their heads are mere thickets of dead wood and superfluous growth. Others again have been mutilated at the hands of local pruners in a cruel manner, and of the two evils I think the latter is the worst. In other cases again some attempts have been made at pruning, but with no thought to detail in workmanship, and one sees in dead branches and hollow trunks the results of bad cuts and the leaving of rough ugly snags. But here and there one may see object lessons in good pruning, and, as an example, I was in an orchard the other day which was pruned a couple of years ago for the purpose of competition. Every branch that was severed was cut as close to the limb as possible, the rough edges of the bark as left by the saw were smoothed over with a knife, and the cut face painted over with Stockholm tar. It was a longer process than the rough and ready pruning of the average farmer, but it has paid, and to-day the cuts are healing over in a perfectly satisfactory manner

---

Example is better than precept, and the object-lessons of farmers and others who are really interested in their orchards, and realise their value, can hardly fail to have an effect on others who, as the sheer result of training, have grown up to be careless about orchards, though in other ways many of them are really good farmers.

H.

Beetroot.—Now is an excellent time for the main sowing of beet. Ground previously occupied by celery will make an ideal site, as the manure used for this crop will be ample for the beet. All that will be necessary is to fork the plot lightly over, breaking up the soil, and adding plenty of burnt garden refuse. Bring the surface to a very fine tilth, level down, and draw drills one to two inches deep, and fifteen inches apart. Place the seeds in little groups of three, at eight-inch intervals. An even crop is assured by sowing in this way. Blood Red and Cheltenham Green top are very finely-flavoured varieties. To procure exhibition roots holes must be bored three feet deep and eighteen inches apart; fill the holes with fine rich soil. Place three seeds in each prepared place, finally leaving the best plant in possession of the site.—G. Ellwood.

THE SMALLER GREENHOUSE ACACIAS.

The genus Acacia is a very extensive one, most of the species being natives of Australia. Nearly the whole of them are very handsome when in flower, but in order to see the majority at their best it is necessary for them to attain large, almost tree-like, dimensions. On the other hand, there are some that can be accommodated in a small or medium-sized structure, and good flowering examples may be grown in pots from five inches to six inches in diameter. These species are popular with the market cultivator, and during the early months of the year delightful little specimens of some of them may be frequently seen in the florists' shops of London. Chief among the smaller kinds, which are especially adapted for this kind of treatment are Acacia armata, a species of dense bushy habit, the phyllodes, as the false leaves are termed, being ovate, and of a very dark green tint. The flowers, which are of a rich golden-yellow colour, are borne in good-sized heads. They are very fragrant Though this attains the dimensions of tree, it may be well flowered in a small state, on which account it is very popu with the market grower. The dense mass of rich green leafage serve admirably as setting to the golden blossoms. This acac is one of the oldest of the New Hol species, having been first sent here in 180

Acacia Drummondi is a far more slende grower than the last, and more delicate in constitution. The flowers are arranged i bottle-brush shaped racemes, which are partially drooping. The colour is a pleasing sulphur-yellow. The leaves are bipinnate, and of a deep green colour. Being a weaker grower this acacia is greatl benefited by a mixture of peat with th potting soil.

Acacia hastulata, known often in gardens and nurseries as Acacia cordata. I general appearance this is widely removed from any of the other acacias, forming, as it does, long slender shoots, wh are thickly clothed with small, thre tered, sharp-pointed leaves. The cre coloured flowers are small, and are clos packed for some distance along the sho Acacia hastulata was but little known within the last decade or so.

Acacia lineata is a compact bushy species, which is clothed with small narrow leaves. The flowers, like little fluffy balls, are of a rich yellow colour, and borne in great profusion. In any selection of the smaller acacias this must be assigned a place.

Acacia obliqua, also known as Acacia ovata. This is a sturdy-growing, freely-branched species, and very popular as a decorative plant. The leaves are sm ovate, and deep green in colour, while t flowers, disposed in little balls, are ri golden-yellow.

Acacia pulchella is of very slender growth, and in time forms a tangled bush The pretty pinnate foliage gives it a light appearance, and when thickly stu with rich yellow flowers it is remark handsome. The shoots are somewhat A very popular species for growing small specimens.

Acacia Riceana is a very popular species and effective specimens may be grown i six-inch pots. The phyllodes are narrow and only about an inch in length. Their colour is a deep green. The flower he are small, and borne in long, drooping racemes. They are of a creamy-whi colour. This acacia may be flowered freely in a small state.

W. T

THE GREAT TEMPLE FLOWER SHOW,

MAY 24, 25 and 26.

Favoured with glorious weather was the twenty-third great floral display held in the Inner Temple Gardens, on the Thames Embankment, London, by the Royal Horticultural Society, when it was opened on May 24. The exhibition, very probably the last to be held at the famous gardens of the Inner Temple, will long be remembered as one of the finest of a long series of grand horticultural displays. Looking back over the last score of years we find that a great difference has come over the general appearance and composition of the show. In the earlier years stove plants figured much more extensively than they do now, and pelargoniums were a prominent feature. Some of the subjects seen in such perfection of form, colour, and culture during this week were scarcely dreamt of two decades ago. We may call to mind a few instances: there are the rambling roses, especially those of the Wichuraiana group; there are the hybrid orchids in large numbers, such hybrids, bigeneric and others, as the hybridist dimly [illegible] for twenty years ago, when odontiodas had not appeared; the hardy primulas, and the Chinese flowering shrubs, the coloured [illegible], and the modern and elegant forms of [illegible] are all new; the improvements in rhododendrons, tulips, gloxinias, gerberas, and streptocarpuses have come about largely during the last two decades; while alpine and water gardening, and Japanese gardening, are developments of quite recent years, and have been the means of vast improvements in the plants and flowers necessary for such cultures, and has also induced several collectors to risk their lives in the hope of discovering new plants of value—a risk that, fortunately, has been amply repaid, from a horticultural point of view. These, then, are a few of the more striking differences between the Temple Show of 1910 and a Temple Show twenty years ago, in so far as its composition is concerned. There are also differences in arrangement and display. Some old exhibitors have dropped out of the running, and others whose names were unknown in the world of horticulture a score of years ago are now prominently before the public. The positions occupied by the various exhibitors do not vary greatly, but there is a great improvement in the manner in which flowers and plants are displayed to public view.

There were one hundred and thirty exhibitors on this occasion, and they filled every available inch of space in five huge tents, besides covering a very large area in the open. Orchids were grandly shown, and among the outstanding novelties were the albino variety of Cattleya Lawrenceana, shown by Messrs. Charlesworth and Co.; the new Odontioda from M. Vuylsteke; and the handsome Odontoglossum Memoria King Edward VII. from Messrs. Sander and Sons. Among greenhouse and hardy flowers the new plants of special interest included Calceolaria Buttercup (C. Golden Glory x C. [illegible]) from Messrs. J. Veitch and Sons; the Marguerite Mrs. F. Sander, a superb [illegible] flower of the purest whiteness, like a glorified pyrethrum; this was from Messrs. F. Sander and Sons, St. Albans, and bids fair to be a very popular garden and market plant.

ORCHIDS.

The orchids were once again a wonderful feature, and they filled the whole of the centre of the huge No. 5 marquee. By reason of their purity and brilliance of colour, their great variety of form and general elegance, orchids invariably form the central feature of interest at this great show.

Facing the entrance from the No. 4 tent Mr. G. Reynolds, gardener to Leopold de Rothschild, Esq., Gunnersbury Park, Acton, set up a magnificent display of Vanda teres, showing these just as they are grown, in large boxes. This beautiful orchid is invariably a great success at Gunnersbury, and when shown over a groundwork of ferns and backed by palms and asparagus, they show up finely. On this occasion we think Mr. Reynolds showed this vanda in finer condition than ever, and in the group there must have been many hundreds of spikes of pale mauve flowers, each with a yellow marked lip.

G.M.1255.

CATTLEYA INTERMEDIA ACQUINII.
A beautiful form, distinguished by the rich purple markings on the petals, exhibited by Messrs. Charlesworth and Co.

A charming exhibit was well arranged by Mr. J. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, and it occupied a large space. In the centre, over a groundwork of asparagus, some delightful odontoglossums, oncidiums, and phalænopsis were disposed, with numerous spikes of the bright Odontioda Bradshawiæ at the base. Towards each end of the group miltonias were piled up with a few lælio-cattleyas to relieve them. Between these three eminences an abundance of choice orchids were disposed, and a few of the best were Odontoglossum Thompsonianum magnificum, Cypripedium Maudiæ, C. Olivia, Odontoglossum crispum Colmanianum, O. Astarte, O. Phœbe splendens, Brasso-cattleya Veitchi, Oncidium pulchellum, the bright-yellow Odontoglossum King George V., and Bulbophyllum Lobbi. This was one of the finest displays ever made from the Gatton Park collection.

A superb display was again made by Messrs. Sander and Sons, St. Albans, who had a somewhat bolder and more distinctive exhibit than usual. At either end were huge pyramids, one composed chiefly of wonderful odontoglossums and rare cattleyas, and the other consisting chiefly of miltonias, vandas, Dendrobium Phalænopsis, and Cattleya Lawrenceana. The big central mass was crowned by a very large specimen Cymbidium Lowianum, encircled by Dendrobium nobile album, and fronted below by grand specimen plants of Brasso-cattleya Veitchi, B.-c. Queen Alexandra, and Cattleya Robt. de Wavrin, with great spikes of Odontoglossum amabile Dreadnought, O. Princess Mary, and O. eximium Emperor rising from among them. On either side of the central display were tall, light erections of Phalænopsis Rimerstadiana, and Renanthera Imschootiana, these combining beautifully. In the valleys between these higher arrangements there were Odontioda Vuylstekei Sander's var., O. Cooksoniæ var. Brilliant, O. Prince S. Fushima, Odontoglossum Jasper stupendum, very fine, and O. Memoria King Edward VII., splendidly and heavily blotched with deep dark purple; the yellow O. Landolphus, Miltonia Memoria Baron Schroder, with a deep brown disk, and M. vexillaria Memoria G. D. Owen, with a remarkably deep maroon blotch at the base of the lip, while conspicuously beautiful among all the other good things was the large-flowered, handsomely-marked Odontoglossum crispum Leonard Perfect.

Mr. J. Robson, Bowden Nurseries, Altrincham, contributed a group of well-grown odontoglossums, chiefly white or very light forms of O. crispum and O. Pescatorei, but there were a few heavily blotched and bright forms in the front of the group, one named O. c. Prince Edward having one large red blotch on each sepal, while O. c. Evanerseanum is almost wholly of a rich red-brown colour. Miltonia Robinsoniæ, an elegant plant, resulting from a cross between M. Roezli and M. Queen Alexandra, was another great attraction in this group, having a light red-brown blotch at the base of the white lip. A new exhibitor was Mr. J. Hoat, gardener to J. T. Clifton, Esq., Lytham Hall, Lytham, who had a light and elegant background of Phalænopsis Rimestadiana and white odontoglossums, against which Lælia purpurata and Miltonia vexillaria showed up to great advantage, and in each case the plants were of good size and well flowered. In the low foreground were many delightful things, and a few of the most interesting were Phalænopsis sumatrana, Lælio-cattleya Endora var. Mark Hamburg, Cattleya Myra Peters Clifton's var., and a few choice odontoglossums.

Mr. Edward V. Low, Haywards Heath, had a number of odontiodas, notably O. Vuylstekiæ, and O. Bradshawiæ, an unnamed heavily-marked odontoglossum, the chaste O. crispum Xanthotes Vine House var., the handsome Lælia-cattleya Lambeauianum, with wide expanded purple flowers, and Lycaste Balliæ. Messrs. Wm. Bull and Sons, Chelsea, had two banks of Cattleya Mossiæ, C. Mendeli, Lælia purpurata, and odontoglossums, one on either side of a little dell of brightly-marked odontoglossums, and a group of Odontioda Chelsiensis, the whole of these being overhung by odontoglossums in variety, and Dendrobium Wardianum.

A large exhibit was made by Mr. Hunter, gardener to the Duke of Marlborough, Blenheim Palace, Woodstock. The plumose nephrolepises were used as a groundwork, but the pots were not effectively hidden by them. Phalænopsis Rimestadiana, a quantity of Odontoglossum crispum, Cypripedium bellatulum, Lælio-cattleya Fascinator, L.-c. Luminosa magnifica, Cattleya Empress Frederick, and C. Lord Rothschild, were the chief features. Mr. W. Bolton, Wilderspool, Warrington, brought up a few choice forms of Odontoglossum crispum, and an extraordinary splashed and streaked variety of Cattleya Mossiæ. Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common, had a small display of odontoglossums, miltonias, and Cattleya Mossiæ.

A beautifully artistic and effective group of orchids was arranged by Messrs. Mansell and Hatcher, Lim., Rawdon, Yorks; indeed, there was no more charming display among the orchids. In the centre finely grown Phalænopsis Rimestadiana were used to crown a high mound of orchids, with bright miltonias, shapely odontoglossums, Odontioda Vuylstekiæ, and Disa grandiflora towards the base. On either side of this there was a big group of the brilliant red Renanthera Imschootiana, each group consisting of from sixty to a hundred spikes. Below these were Cattleya Mendeli Princess Victoria, Dendrobium nobile album, and Odontoglossum Pescatorei. The ends of the group were equally beautiful, Cattleya Mendeli and C. Mossiæ being advantageously displayed, while choice specimens of Odontioda Goodsoniæ, O. Bradshawiæ, Odontoglossum Phœbe, O. crispum Leonora, O. amabile augustum, Brasso-cattleya Schroderæ-Digbyana, and Oncidium Lanceanum were stood well above the cypripediums, etc.

TEMPLE SHOW—BEGONIA EMPRESS MARIE.

A fine variety with large pure white flowers, raised and exhibited by Messrs. Blackmore and Langdon, Bath.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a bold exhibit of orchids, and all the plants were set up so as to show their individuality. Dendrobium Wardianum and Lælia purpurata made a splendid background, with D. nobile album towards the sides. The finer forms of Cattleya Mossiæ and C. Mendeli were grouped towards the front with such beautiful things as Dendrobium Parishi, D. barbatulum, Cattleya Parthenia Prince of Wales, C. intermedia cærulea, C. Dusseldorfei var. Undine, Brassia brachiata, and Cypripedium Woottoni.

The large exhibit contributed by Messrs. J. Cypher and Sons, Cheltenham, had a bold central mass of Cattleya Skinneri below a pyramid of fine forms of Miltonia vexillaria. Lælia purpurata was grandly shown, and in great variety, as usual, by the Cheltenham firm. Odontoglossums were a good feature, and there were some brilliantly coloured but unnamed hybrids among them. Miltonia vexillaria Empress Victoria Augusta, M. Bleuana superba, Masdevallia Veitchiana grandiflora, Cypripedium callosum Sanderæ, Lælia cinna-brosa, Phaius Norman, Lælio-cattleya Hyeana, and Brasso-cattleya Imperatrice de Russie, were a few of the finer plants in this collection.

A fine display from a private source was the large and well-arranged exhibit from J. Menteith Ogilvie, Esq., The Shrubbery, Oxford. Large plants, finely-flowered, of Lælio-cattleya Fascinator, L.-c. Canhamiana, and Brasso-lælia Veitchi formed a grand centre for the group, with such choice varieties of Miltonia vexillaria as Chelsensis and virginalis grouped at the base. The ends of the group were pyramids of Miltonia vexillaria and Cattleya Mossiæ, with spikes of odontoglossums arching over these. Then, in between the higher parts of the group, were very choice subjects, such as Cattleya Dusseldorfei, Cypripedium callosum Sanderæ—a fine batch, Renanthera Imschootiana, Odontoglossum luteo-purpureum Vuylstekianum, Odontioda Bradshawiæ, Cypripedium Lawrenceanum, Odontoglossum percultum, and O. crispum Empress of India.

Once again Messrs. Charlesworth and Co., Haywards Heath, had a glorious display. The centre was a mass of richly-coloured Miltonia vexillaria with fine spikes of Phalænopsis Rimestadiana rising therefrom and a unique plant—the long-looked-for albino of Cattleya Lawrenceana, named Mary Regina, was placed in front. This was a very great attraction to the orchid specialists. At one end of the group lovely varieties of Odontoglossum crispum were associated with O. Pescatorei gigantea, O. Phœbe, O. Phœbe Queen of Spain, the [illegible] ous O. Lambeauianum giganteum, and O. luteo-purpureum Vuylstekianum. At the other end Dendrobium Phalænopsis was pleasingly associated with D. nobile [illegible]. Very choice things in the body of the group were Odontioda Charlesworthi, Brasso-cattleya Bradshawiæ, C. Mossiæ King Haakon, L.-c. Golden Glory, Odontoglossum Ceres, O. Thompsonianum, O. Wilckeanum Imper[illegible], Cattleya intermedia Acquini, C. Mossiæ King Alfonso—very fine, C. Mendeli Queen Maud, Cypripedium Maudiæ, and C. caudatum, and the new and brilliant Sobralia Charlesworthi, the lip edged with deep red purple.

Mons. Charles Vuylsteke, Loochristi, showed two superb odontiodas named O. King George V. (scarlet and gold and [illegible]) F.C.C., and O. Royal Gem (A.M.), and two glorious odontoglossums, i.e., O. eximium Empress of India (F.C.C.), and O. [illegible] (A.M.)—two F.C.C.'s and two A.M.'s for four plants! Mr. Richard Ashworth, Ashlands Hall, Newchurch, brought up some splendid hybrid odontoglossums, and a fine form of O. triumphans. Mr. Davis, gardener to J. Gurney Fowler, Esq., Woodford, showed Odontoglossum amabile Fowlerianum with two spikes of lovely flowers. Mr. [illegible], gardener to F. Wellesley, Esq., Westfield, Woking, showed Odontoglossum Armstrong[illegible] with big deep purple-marked flowers. Mr. [illegible] Day, gardener to H. S. Goodson, Esq., [illegible]

By Appointment.

NEW ROSES.

WM. PAUL & SON,

BEG to call attention to their extensive collection of New Roses, including Rambling varieties, good plants of which, in pots, will be ready for delivery early in June and throughout the summer months.

WM. PAUL & SON'S NEW VARIETIES:—Alice Cory Wright (H.T.) 7/6 to 10/6; Elsie (Wichuraiana Hybrid) 7 6; Juliet (Hybrid Briar) 10/6; Portia (H.T.) 7/6; Althea (H.T.) 3/6 and 5/-; Cynthia (H.T.) 3/6 and 5/-; Fairy Perpetual-flowering Rambler) 2/6 to 5/-; Grace Thomson (Rambler) 3/6; Margaret (H.T.) 3/6 and 5/-

New British and Continental varieties of other raisers 2/- to 10 6 each.

PRICED DESCRIPTIVE CATALOGUE POST FREE ON APPLICATION.

Also a large general collection of Roses in pots for filling vacancies in rose gardens, and for pot culture, 12/- to 42/- per dozen; Climbers and Ramblers, 12/- to 60/- per dozen.

MELLINGS' PATENT COMBINED

LAWN SPRINKLER & HOSE REEL.

The above is a Circular Brass Tube attached to the inside of the rim of a Gossage Hose Reel and well perforated, producing the effect as illustrated.

THE ADVANTAGES OF THE SPRINKLER ARE:

That the combination is much cheaper than purchasing a Sprinkler and Reel separately.
That it is superior to others, owing to a much better distribution of the water.
That it can be moved about the lawn by pulling the hose without turning the water off, as is necessary with most Sprinklers.
The Reels, being galvanized, will not rust.
There are no loose parts to get lost, and in coiling the hose no part is in the way to detract from the use of the Reel.

Prices:—No. 0, **15/9.** No. 1, **18/6.** No. 2, **22/6.**

To be obtained from—

lawn, Putney, brought forward Odontoglossum amabile Fredericki with wonderfully fine brown markings.

ROSES.

The roses occupy a high position at the Temple Show, and rank with the orchids for the extent to which they are shown, while they have a beauty and fragrance of their own that places them beyond competition with other flowers.

The big and beautiful display of roses made by Messrs. Wm. Paul and Son, Waltham Cross, was, we think, the finest effort this celebrated firm has made. Rambling and pillar roses were in the very pink of perfection, their great racemes of flowers hanging in graceful masses from base to summit, and almost hiding the leafage. Forming a groundwork for these elegant pillars and climbers were choice H.P. and H.T. varieties shown as dwarf bushes. Reverting to the pillars, those that appealed to us most were Coquina, a pink cascade; Delight, a glorified Hiawatha; the blush-pink Elsie, Lady Gay; the bright Excelsa, a finer Crimson Rambler; the elegant pure white Milky Way; the brilliant Hiawatha; with Lady Gay, White Dorothy Perkins, and the new erect-flowering Lyon Rambler. Among the larger-flowered varieties we made special note of Cynthia, Elaine, Rhea Reid, Lyon Rose, the lovely pink Margaret, Albatross, and the new H.T. variety Portia, a lovely pale blush-tinted variety of fine size and substance.

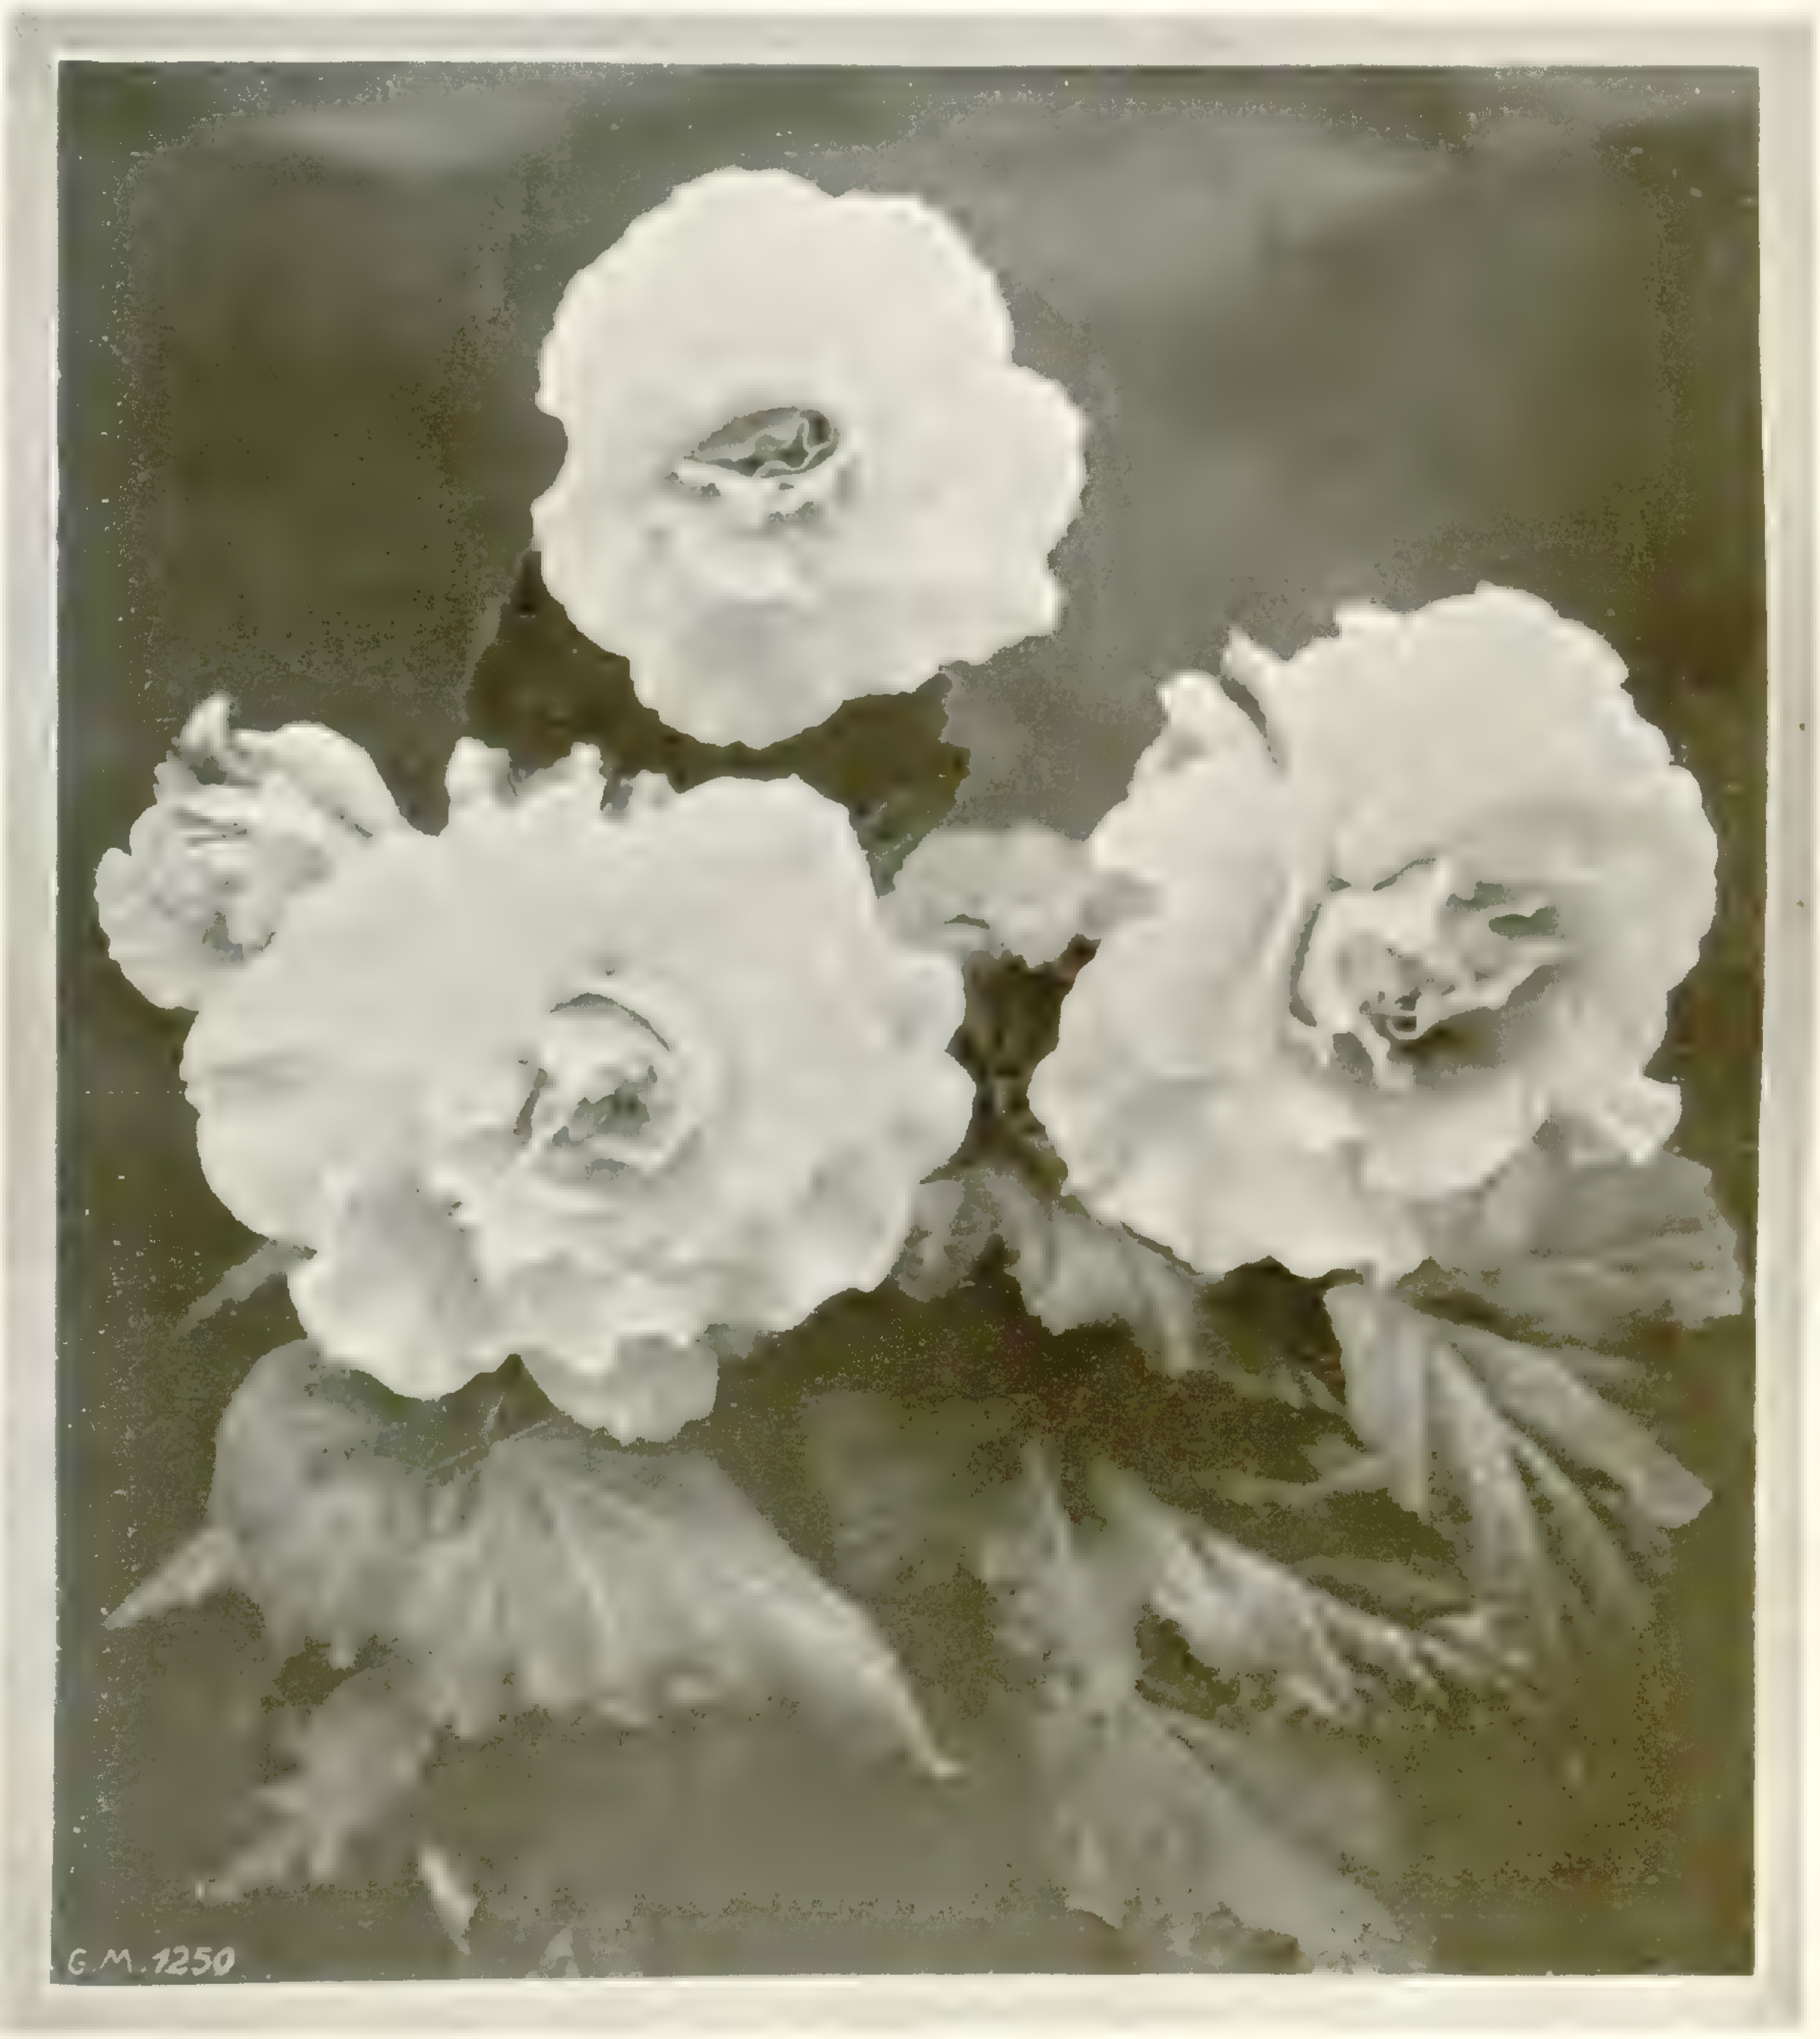
Messrs. H. Cannell and Sons, Swanley, brought up a famous lot of American Pillar roses, a variety with which they created a sensation at the Temple Show of 1909. They showed it even better on this occasion, and its big clusters of large, single, rich pink flowers were very attractive, everyone conceding it to be a lovely rose. Mr. Chas. Turner, Slough, showed a fine lot of standard and pillar roses, the former carrying big fat blooms of fine form and substance. Dorothy Perkins and Crimson Rambler roses formed a background to the whole, but the great features were large, broad, pillar-like masses of Lady Gay and the bright scarlet Hiawatha. In the big tent Mr. G. Prince, Longworth, showed some very pretty roses, the yellow Banksian, Mdme. Jean Dupuy, and Souv. de Pierre Notting all showing up well under spreading, weeping standards of Lady Gay.

A splendid corner group of roses in the big tent thoroughly well upheld the high reputation of Messrs. Paul and Son, Cheshunt. Remarkably fine were the very tall weeping standards of White Dorothy Perkins, Hiawatha, and Excelsa, Lady Godiva, and the pillars of Coquina, White Dorothy, Lady Gay, etc., all smothered with flowers. Very fine were the flowers on the dwarf roses beneath the taller plants, and among these Mdme. Segond Weber, G. C. Waud, Queen of Spain, David Harum, Molly Sharman Crawford, Marquise Sinety, and Neily Johnstone were delightful. It was a superb, brilliant, fragrant, and elegant exhibit.

Messrs. Frank Cant and Co., Colchester, made a fine display with their roses. At the back were specimen plants of White Dorothy, Lady Gay, Minnehaha, Hiawatha, Dorothy Perkins, and others; in the centre was a pretty group of Austrian Copper and Austrian yellow briars, and along the front were stands of cut blooms, staged in the orthodox style. Altogether, the group was a fine one, and worthy of the reputation of the exhibitor. Whenever Mr. George Mount, of Canterbury, shows roses the public has a treat, and this occasion was no exception to many of its predecessors. It is doubtful whether finer Fran Karl Druschkis and Ulrich Brunners have ever been seen at a Temple Show, and Mrs. John Laing was superb. Lady Hillingdon, a new seedling rose, of unique colour, was very much admired, and both Dean Hole, Liberty, and Richmond were beautiful.

Messrs. B. R. Cant and Sons' exhibit from Colchester was almost entirely composed of climbing roses in pots, and a unique collection it was. Evidence of the popularity of this type of rose was obvious from the comments of visitors, and we have yet to see better flowered specimens of Lady Gay, The Garland, Dorothy Perkins, Blush Rambler, White Dorothy, and other favourites of this charming family of roses. Included in the exhibit was a standard of Messrs. Cants' new rose Claudius.

Bamboo flower stands were utilised to advantage by Messrs. Stuart Low and Co. for showing their roses, and the Lyon Rose, a new variety, seemed to lend itself to this method of displaying it. In the annexe between the tents, Messrs. Hobbies, Lim., Dereham, had a line of cluster roses, and they entirely filled one end of the long marquee with this class of roses of varying character. Amongst them were splendidly flowered plants of Minnehaha, Coquina, the popular Dorothy Perkins, Hiawatha, American Pillar, Lady Gay, White Dorothy Perkins, and others. This fine exhibit marked a change in Temple shows from the time when Crimson Rambler occupied a position of solitary state in this branch of the rose family.



TEMPLE SHOW—BEGONIA HON. MRS. RONALD GREVILLE.

A handsome variety, raised and exhibited by Messrs. T. S. Ware, Lim. Flowers white tinted pink.

Messrs. Alex. Dickson and Sons, Newtownards, had an elegant little exhibit of cut roses, which included several fine novelties, namely, Theresa, Nita Weldon, Duchess of Westminster, and Lady Ursula.

BEGONIAS.

Messrs. Blackmore and Langdon, of Bath, again proved themselves to be masters of begonia culture, and it would be impossible to conceive a lot of finer flowers than those staged by the above firm. The plants were all of a healthy character, and freshness was the tone of the group. Just to name a few of the novelties, Pink Pearl, Marie Nicholas, Empress Marie, Lady Tweedmouth, and Mrs. W. L. Ainslie, were remarkably fine. A rather stiffly arranged bank of begonias was shown by Mr. A. L. Gwillim, New Eltham, Kent, but the flowers were very good, and we were rather struck with Sultan, Alice Flood, and Margaret Gwillim.

Messrs. Thomas S. Ware, Lim., Feltham, sent a big lot of begonias, but the flowers would have looked better if the mass had been a little more broken. Individual flowers were exceptionally fine, and particularly so the following novelties: Lady Cromer, a grand flower of flesh-pink tint, King Edward VII., Mrs. W. H. Edwards, Hon. Mrs. Ronald Greville, Duchess of Connaught, Mrs. Eustace Palmer, and Mrs. Andrew Tweedie.

CARNATIONS.

Once more the popularity of the carnation was demonstrated in the presence of wonderful collections of beautiful flowers. A very delightful private exhibit was that staged by Mr. A. T. Paskett, gardener to E. J. Johnstone, Esq., Burr's Wood, Groombridge, Kent, and the plants throughout were object-lessons in good culture. Amongst the varieties we noticed Governor Roosevelt, a velvety-crimson flower; rose pink Enchantress, White Perfection, and Beacon, a fiery red. The mode of arrangement reflected considerable credit on the exhibitor. Messrs. Cutbush and Sons, Highgate, occupied their old position in the big tent with a tastefully-arranged group, in which roses and carnations were conspicuous. Amongst the latter we noticed well-grown plants of Maggie Hodgson, Malmaison Blush, Duchess of Westminster, and King Arthur, a brightly-coloured scarlet flower.

A small, but effective group of carnations was that set up by Messrs. R. H. Bath, Lim., Wisbech. The flowers were exhibited in cut form, and the most effective varieties were Robert Craig, Winsor, Melody, May Day, and Enchantress. Delightfully artistic are the adjectives which best describe the display of carnations from Messrs. Stuart Low and Co., Bush Hill Park. The flowers, each one a good specimen, were tastefully set up in vases with baskets suspended from above and greenery underneath, and the varieties which appeared to attract most attention were Princess Juliana, a new variety of peculiar orange shade; Mikado, quite a unique colour; Baroness M. de Brenen, a new variety of flesh-pink shade; Black Chief, and White Perfection. The scarlet Britannia was conspicuous in the group, and we noticed some magnificent flowers of Malmaison Princess of Wales.

TEMPLE SHOW—GEUM MINIATUM PERRY'S VARIETY.

A handsome form, shown by Mr. A. Perry, Enfield; the flowers large, and the colour rich orange scarlet.

Mr. C. F. Walters, Balcombe, Sussex, put up a tasteful group of carnation flowers, intermixed with sprays of Asparagus Sprengeri. Conspicuous amongst the varieties were Edith Waters, a fine flower, but we did not admire the paper collars round the fine flowers of Malmaison Princess of Wales. The dark Carola took our attention, and Enchantress was shown in good form. Messrs. Young and Co., Hatherley, Cheltenham, staged a fine lot of fresh-looking carnations, which included Mikado, White Lawson, Britannia, Winsor, and White Perfection. A grand lot of flowers were set up by Mr. G. Lance, of Hampton, and the arrangement was quite pleasing. Harlowarden, Mrs. H. Burnett, White Perfection, Beacon, and Britannia were exceptionally good in this collection.

Messrs. W. H. Page, Hampton, showed a nice lot of carnation flowers with a background of roses, which rather added to the effect. Much the same varieties were staged as in other collections, and Pink Enchantress, Union Jack—a dark red, and White Perfection made themselves seen.

The Thatcham School of Gardening, near Newbury, sent a small but choice collection of carnation blooms. Messrs. Jarman and Co., Chard, staged a rather nice new yellow carnation called Mrs. Townsend. Mr. S. Mortimer, of Farnham, bordered his collection of carnations with flowers of a white stock called All-the-Year-Round, but the mixture did not seem misplaced, and amongst the former flowers were good specimens of Beacon, Enchantress, and Winsor. Carnations were well shown by Mr. A. F. Dutton, Iver, Bucks, but the arrangement might have been better, as the group was very scanty at the front. Of the individual flowers we speak in commendable terms.

Very charming was the collection of long-stemmed flowers from the Guernsey specialist Mr. H. Burnett, and every flower bore the stamp of good cultivation. Marmion was shown in fine form, and we also admired Snowball, Fortuna, a pleasing shade of orange-yellow, and Pluto, a deep crimson flower of good substance. It was a happy idea on the part of Mr. C. Engelmann, Saffron Walden, to confine his exhibit of carnations to the dark crimson variety, Carola, and it would be difficult to conceive a more tastefully arranged display of this charming carnation. Another Guernsey specialist who showed a fine lot of flowers was Mr. B. E. Bell, of Castel Nursery; President, Beacon, and Winona were especially good, and there was no fault to be found with the arrangement.

Mr. W. H. Lancashire, carnation specialist, Guernsey, staged some wonderfully fine flowers of White Perfection, Robert Craig, Marmion, Black Chief, and others. The arrangement of the exhibit was also pleasing.

SWEET PEAS.

Messrs. Robt. Sydenham, Lim., Birmingham, put up a very pretty collection of sweet peas flanked with lily of the valley grown in moss fibre. Sunproof Crimson, Prince of Orange, Seafoam, Black Knight Spencer, Elsie Herbert, and Marjorie Willis were the varieties which mostly took our attention. A very beautiful lot of sweet peas, with violas in shallow dishes beneath the vases, came from Mr. H. J. Jones's nursery at Lewisham. We doubt whether finer flowers on longer footstalks have ever been shown at this time of the year, and there was a marked freshness about the blooms. To mention names, Earl Spencer, Mrs. E. Noakes, Helen Lewis, Queenie, King Edward VII., Colleen, and Silas Cole were to us the most striking, and the pretty violas amongst the peas was one of those original ideas in exhibiting which seem to come natural to Mr. Jones.

Novelty in design was a feature of the arrangement of sweet peas staged by Messrs. E. W. King and Co., Coggeshall, as the flowers were arranged in arches as well as the orthodox vases, and a background of carnations added to the effect. Amongst the varieties Mrs. William King, Frank Dolby, Anglian Orange, Anglian Pink, Midblue, Paradise Red Flake, Queen Mary, and Stirling Stent were greatly admired. Quite a pretty little lot of peas were sent by Messrs. Dobbie and Co., Edinburgh, the chief varieties being Masterpiece, Sunproof Crimson, Earl Spencer, and Mrs. Hugh Dickson. Mr. W. E. Alsen, Denmead, Hants, staged an interesting little collection of sweet peas, and the variety which overshadowed the rest was the new orange-coloured novelty Stirling Stent.

STOVE PLANTS.

A large and bold group of splendidly-grown stove plants from Messrs. Jas. Veitch and Sons, Chelsea, proved a great attraction, and as few stove plants were exhibited, the group was conspicuous. It was a finely-arranged display with a few orchids in the centre to lend lightness to the bulkier specimens. The caladiums were fine, notably Roncador, Raymond Lemoinier, Mdme. J. Box, Guil Mar, and Pantia Ralli. Dieffenbachia Bausei, D. Fournieri, Dracæna Godseffiana, D. lineata atropurpurea, a selection of sonerillas and bertolonias, Aralia elegantissima, Croton B. Comte, Anthurium Rothschildeanum magnificum, A. Wardi, Medinilla magnifica, Heliconia illustris, and the elegant Cyrtomium Rochfordi were a few of the finer plants set up.

The centrepiece of a bright group of stove plants from Mr. L. R. Russell, Richmond, was a grand plant of Cynophyllum magnificum; this was backed by fine dracænas, alocasias, and caladiums, while crotons and anthuriums made rich colouring in the front. In another group the bertolonias with their handsome leaves, veined and spangled with silver or rose over green of various shades.

were well shown by Mr. L. R. Russell, Richmond, who also had a pan of the golden-tessellated Macodes petola.

Messrs. J. Peed and Son, West Norwood, had some superbly-grown and grandly-coloured specimens of caladiums, their leading varieties being Roncador, John Peed, the lovely Raymond Lemoinier, Candidum, Marquis of Camden, and the brilliant Triomphe de Comte.

FLOWERING TREES AND SHRUBS.

In their usual place, in the big tent, Messrs. R. and G. Cuthbert, Southgate, put up one of their brilliant exhibits of Ghent and Mollis azaleas. The display was relieved of any sense of solidity by the careful use of Japanese maples, bushes of various sizes and standard specimens. The grouping, too, was excellent, and the harmony of colouring perfect. Of course, Anthony Koster was very much in evidence, but even finer than this was Floradora, a mollis-sinensis hybrid (A.M.), with big rhododendron-like flowers in large trusses, and of a brilliant orange hue. Norma, Baron Edmund de Rothschild, Lady Pigott, and Fanny were other lovely varieties on view.

A bank of glorious rhododendrons was a fine feature in the big tent. This was from Messrs. J. Waterer and Sons, Bagshot, Surrey, and the glorious Pink Pearl was the great attraction even among so many other good things. The scarlet Doncaster and brilliant Charlie Waterer shone brilliantly among the rest.

Flowering trees and shrubs were attractively shown by Messrs. James Veitch and Sons, Chelsea, who had a bold group of graceful wistarias, and fine bushes of Pink Pearl rhododendron. The sulphur-yellow Rosa Hugonis, weeping standards of Cytisus scoparius grandiflorus, the dwarf, rosy, round-flowered Rhododendron Soulei, the rosy Cytisus Dallimorei from Kew, Philadelphus Lemoinei rosace, and Hydrangea arborescens alba-grandiflora were among the fine things in the foreground of the display.

A beautiful group of clematises from Messrs. G. Jackman and Son, Woking, Surrey, showed the value of these splendid free-flowering climbers. Most of the plants were on balloon or oval trellises, and their big bright flowers made a brave show. A few plants had been trained to form weeping standards, notably C. Jackmanni superba and C. viticella alba. The finest of the formally trained specimens were Ville de Lyon, rich rose-red; Fairy Queen, a huge pink flower; Nelly Moser, Mrs. G. Jackman, Lady C. Neville, the deep purple-blue Lord Neville, and the fine Jackmani rubra.

HARDY FLOWERS AND ROCK GARDENS.

From Messrs. Kelway and Sons, Langport, came an interesting collection of pyrethrums and pæonies. Many shades of colour were represented in the former flowers, very striking varieties being Lord Milner, Passion-flower, Firefly, and Lord Roberts.

A very fine collection of hardy flowers was shown by Messrs. W. Artindale and Son, Sheffield, and amongst them we noticed charming little phloxes, aubrietias, and saxifragas nestling in little rocky crevices. Anemone King of the Scarlets was a feature in the rock arrangement, and not the least interesting plant shown was Daphne cneorum, which was much admired.

Trollius giganteus and other forms were shown by Mr. Amos Perry, Enfield, who also staged Eremurus Elwesianus, German irises in variety, and a grand display of tree pæonies. There was no useless repetition in this exhibit, and every plant shown had an interest of its own. Not the least attractive item in the group was the flowers of the new hybrid forms of Gerbera Jamesoni.

Quite a crowd of interested and curious people crowded round the miniature rock garden arranged by Messrs. Bakers, of Wolverhampton. Amongst the gems of the alpine family were dainty saxifragas, blue Edraianthus serpyllifolius major. Chief amongst the first-named plants were the new varieties Miss Willmott, and Codsall Cream.

Cypripediums spectabile and pubescens showed up well, and we noticed also a few quaint anemones, and a general collection of hardy cut flowers.

Mr. Maurice Prichard, Christchurch, had a large, but rather crowded display of hardy flowers, in which were pæonies, irises in variety, Oriental poppies, golden-yellow trollius, pyrethrums, and a charming bank of scillas in varying shades. Many people seemed surprised that bluebells could make such a pleasing show on a table.

All kinds of hardy flowers were included in the collection staged by Mr. R. C. Notcutt, Woodbridge, and amongst other things we noticed some attractive pæonies and tall eremuri. Despite a little overcrowding the arrangement was pleasing.

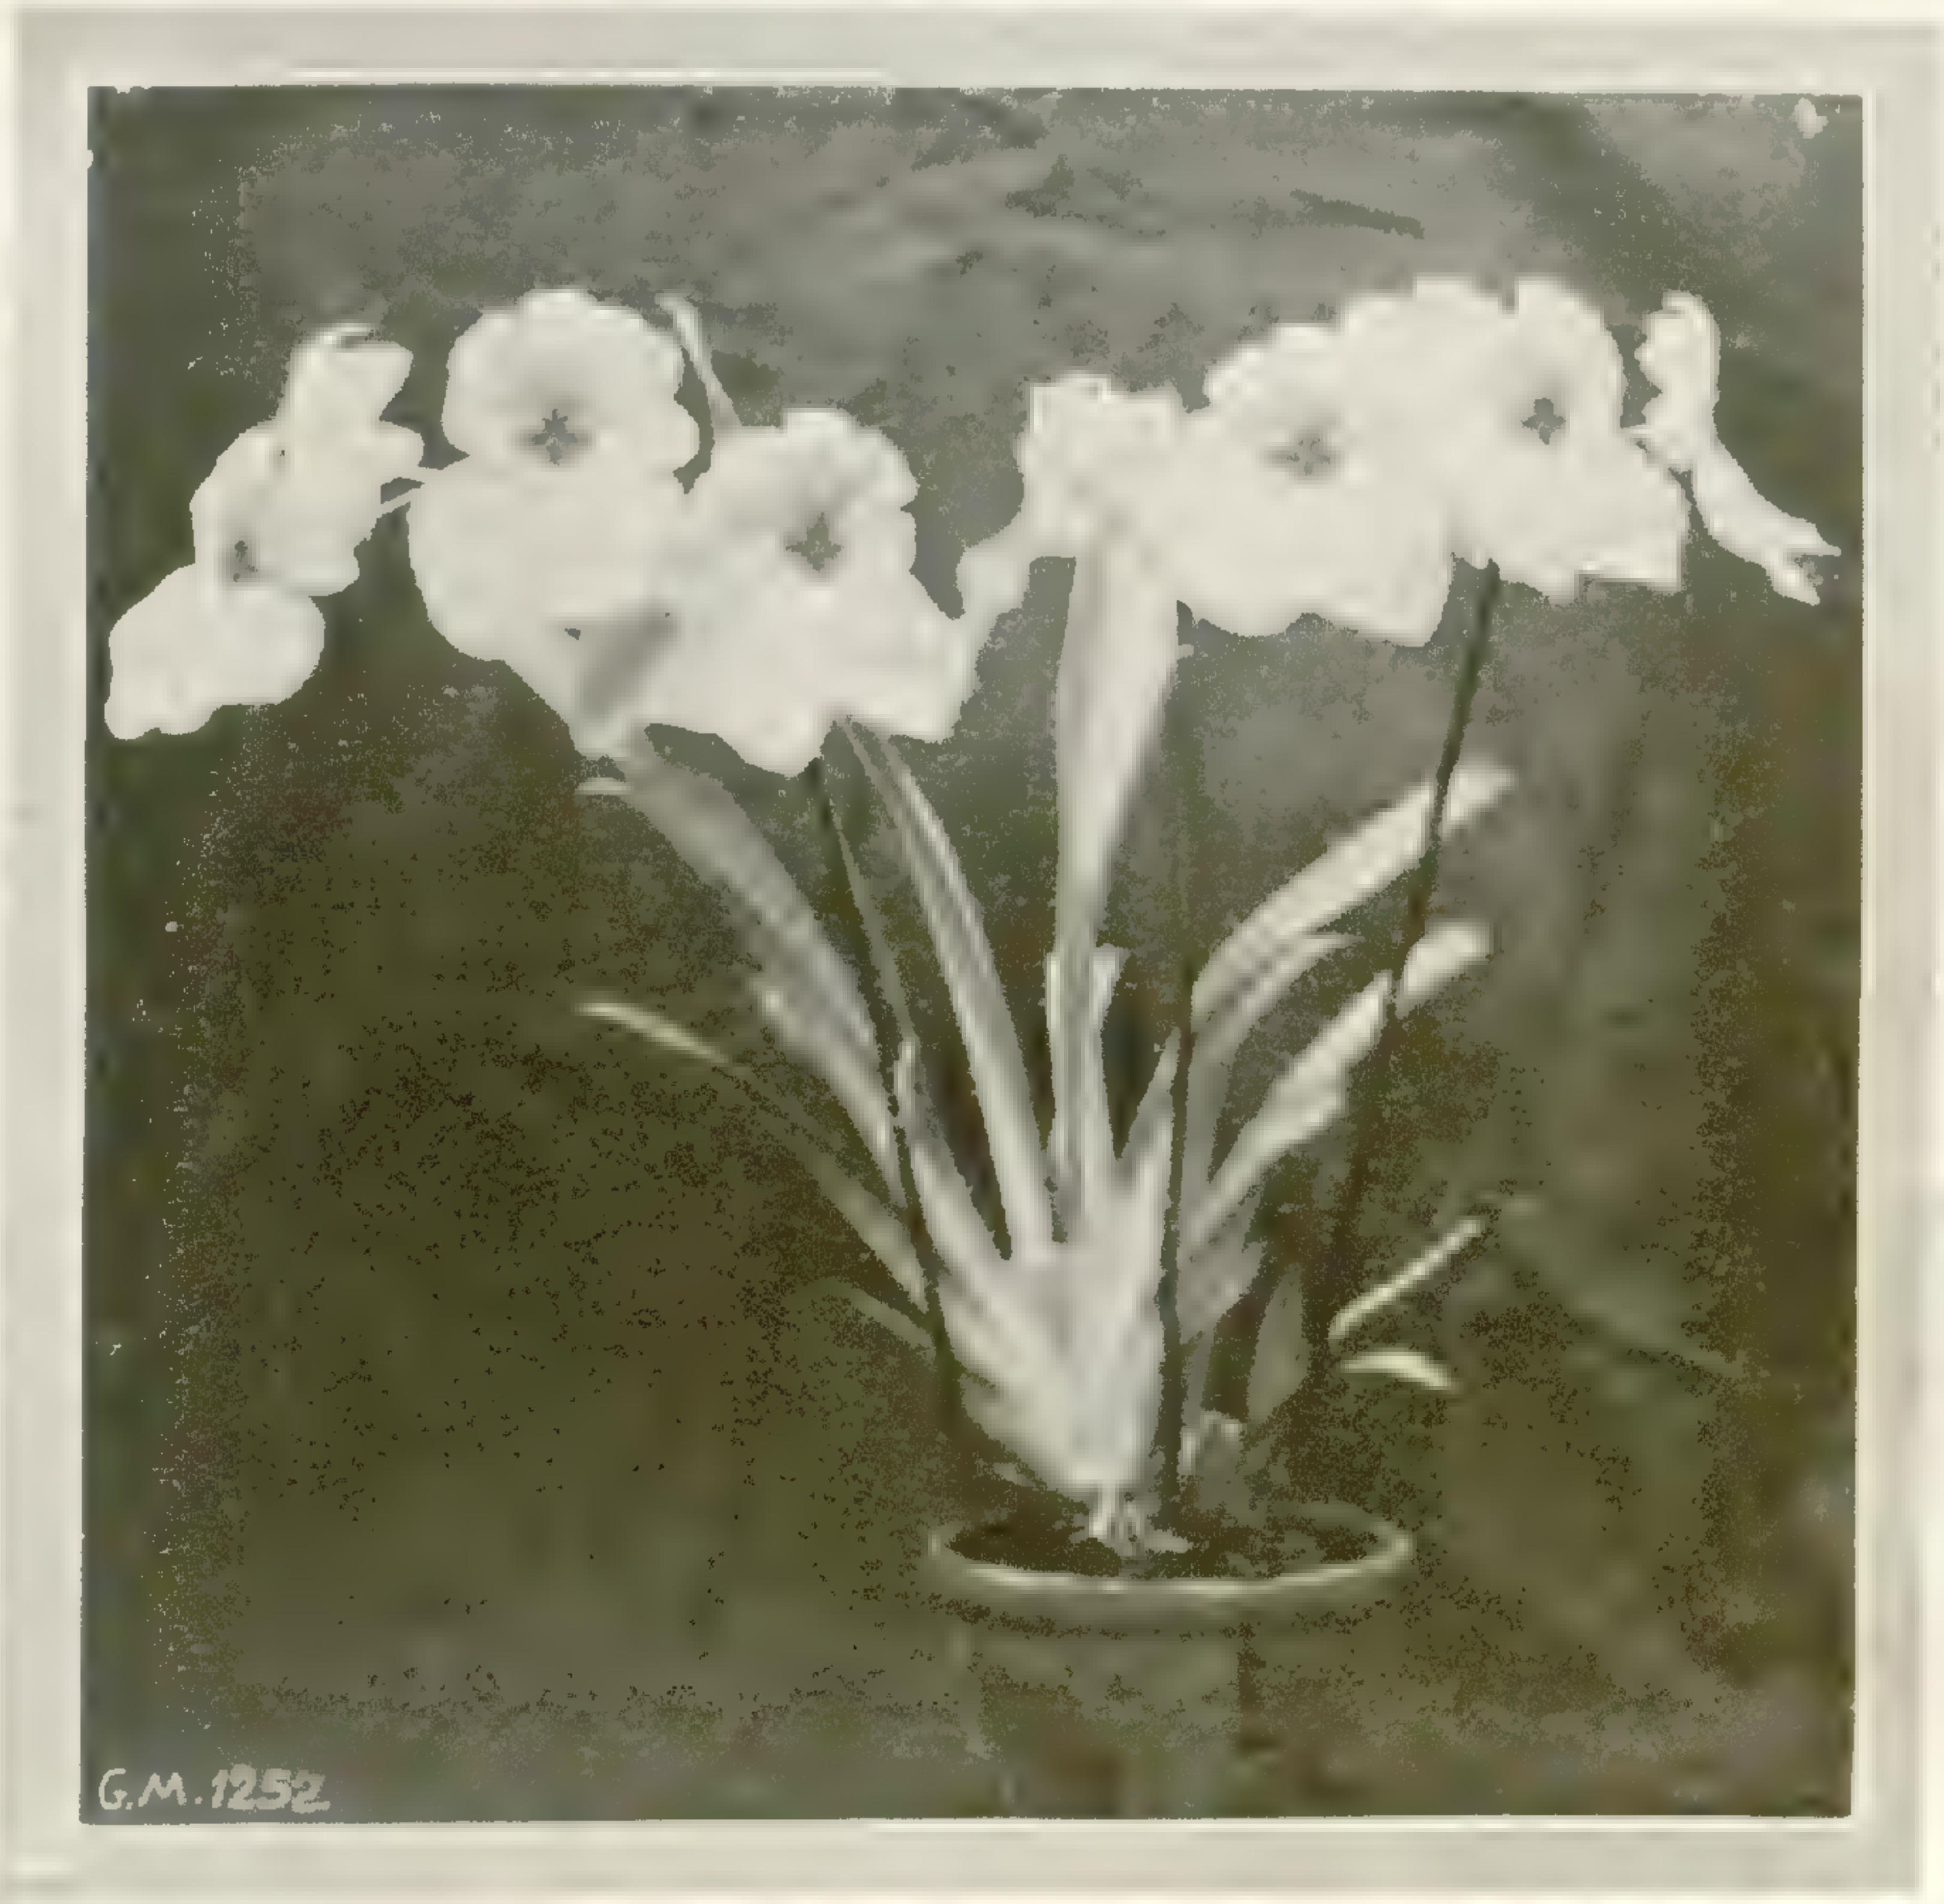
It goes without saying that Messrs. Barr and Son, Covent Garden, had a large and complete display of rock plants and hardy flowers. Pretty phloxes were rubbing shoulders, as it were, with equally charming primulas, and dainty little cyclamens peeped out of their imitation rock crevices. Gladioli Colvillei, The Bride, Peach Blossom, and Ackerman were attractive, and the same remark applies to the Spanish irises and aquilegias.

Sprays of violas and violas in jars were staged by Messrs. Dobbie and Co., Edinburgh, in almost bewildering variety, but by the afternoon of the opening day many of the flowers in the spray showed signs of withering. Pansies were also included in the shape of finely marked flowers, and these helped to make up a very interesting exhibit.

Messrs. Gilbert and Son, Bourne, Lincs., staged a very interesting collection of anemones, amongst which a variety called King's Scarlet was much admired. Another attractive variety was a new single of magenta shade called Fulcor. The new spiræas Queen Alexandra and Peach Blossom were staged by Mr. Van Waveren, Kruijff, Holland.

Cactus dahlias as perfect as one sees in September were set up by Messrs. Carter Page and Co., but somehow dahlias do not seem in place at a May show. Some attractive singles and semi-doubles were shown as well as some pretty phloxes and viscarias.

A large group of hardy flowers from Messrs. Wallace and Co., Colchester, was remarkable for the collection of liliums it contained, these including L. Szovitzianum, L. elegans Orange Queen, L. Martagon dalmaticum, L. japonicum Colchesterense, L. Marham, L. Browni, and the tall bright yellow L. Hansoni. The finer tulips, Cypripedium spectabile, Orchis foliosa, the bright Habranthus pratensis, gladioli of the Colvillei group, Iris Susiana, Incarvillea grandiflora, and pink spiræas, all combined to make up an extremely elegant and brilliant display of choice hardy subjects, the whole crowned by a mass of eremuri spikes. Messrs. Thos. S. Ware, Feltham, had a pretty collection of hardy cypripediums in the No. 4 tent, a selection of saxifragas, Sarracenia flava major, S. Drummondi, and the bright Saxifraga Aizoon rosea.



TEMPLE SHOW—MILTONIA VEXILLARIA EMPRESS VICTORIA AUGUSTA.

A distinct variety with rich pink flowers of large size, exhibited by Messrs. J. Cypher and Sons, Cheltenham.

Rhododendrons in variety formed the background of the exhibit staged by Mr. G. Reuthe, Keston, and along the front was a host of interesting plants of the alpine order. Azaleas were also represented, and conspicuous also were the brilliant flowers of Embothrium coccineum. A number of pretty auriculas in pots were also admired.

Messrs. B. Ladhams, Southampton, had a lot of things crowded into their exhibit of hardy flowers, and the plants which attracted most attention were Meconopsis cambrica plena, and a pretty little pink called Prince Christian. Messrs. George Bunyard and Co., Maidstone, were represented by a group which contained Lilium umbellatum, German irises, pæonies in variety, Trollius Orange Globe, and a dainty little rock garden where bloomed Primula japonica, Dodecatheons elegans and giganteum, Saxifraga pyramidalis, and phloxes. Not the least interesting exhibit of alpines and hardy flowers was that from Messrs. G. and A. Clark, Dover. The usual things were represented, including some very fine pyrethrums, eremuri, Trollius Fire Globe, and others, and the large mournful-looking Iris Susiana. Marguerites White and Pink Perfection in this group were much admired.

Primula japonica, P. pulverulenta, and P. Sieboldi varieties were the leading features in a small group of hardy flowers shown by Mr. A. J. Harwood, St. Peter's Nursery, Colchester. Verbascum Caledonia, with rosy buff flowers, was a fine feature in the group of hardy flowers submitted by Messrs. G. Gibson and Co., Bedale, Yorks; Ranunculus speciosus fl. pl. was another interesting plant. Mr. H. Hemsley arranged a rock garden, and in it set out a wide range of plants. Crinodendron Hookeri, Trollius Orange Globe, Cheiranthus mutabilis, Daphne cneorum, Androsace coronopifolia, Primula pulverulenta, and Gentiana acaulis were a few we made note of.

A bank of rare colour was provided by Messrs. Gunn and Sons, Olton, who had a solid mass of flowers of their Viola cornuta purpurea; this was backed by spikes of Saxifraga pyramidalis, and in the centre was a patch of Viola cornuta alba, which served to accentuate the colour of the deep purple variety. The beautiful sweet sultans, Honeymoon, yellow; The Bride, white; and Bridegroom, rosy, and Bridesmaid, cream, were well shown by Messrs. Jarman and Co., Chard, who also had a neat trailing, variegated pelargonium named Mrs. Newton.

Messrs. J. Forbes, Lim., Hawick, brought up a selection of pansies and violas, a few delphiniums, and some glorious pentstemons, such as Jules Jansen, Dragoon, Galatea, Lady Forbes, Mrs. Michie, Dr. Barrie, and Florian, all very fine varieties. Messrs. A. Young and Co., Elgin, submitted anemones in bright colours, but the flowers were small. Selections of Primula japonica, groups of Cypripedium pubescens, and C. spectabile, liliums, Gladiolus Peach Blossom, pink lupins, Spanish and German irises, and some handsome Oriental poppies came from Messrs. G. Jackman and Son, Woking.

TEMPLE SHOW—TULIP NORMAN KNIGHT.

A handsome May flowering tulip, with flowers large in size and rich in colour, shown by Messrs. R. Wallace and Co., Colchester.

Some glorious lilacs were shown by Messrs. Paul and Son, Cheshunt, but unfortunately the flowers were overcrowded; Souv. de L. Thibaut, President Carnot, Mdme. C. Perrier, and Souv. de Leon Spathe were all lovely varieties. Varieties of Iris Kæmpferi were shown by Messrs. F. Lilley, Guernsey, in company with Spanish irises, lovely forms of Gladiolus Colvillei, ixias, anemones, and tulips. Garden polyanthuses and border auriculas were charming, as shown by Messrs. Storrie and Storrie, Glencarse, N.B., the fragrant yellow auriculas are delightful, while the bold trusses of very large flowers on the polyanthuses proved very attractive.

Messrs. Malletts, Cheddar, had a rock garden, and showed a great variety of saxifragas, daphnes, hardy primulas, etc.; and at one end had a bright group of tulips and gladioli. Messrs. Whitelegge and Page, Chislehurst, showed herbaceous and alpine plants, together with sweet peas, etc., and crowded a little collection of odontoglossums at the end of the group; the combination was not a good one. Mrs. Lloyd Edwards, Bryn Oerog, Llangollen, presented a few fine saxifragas, i.e., S. rosea superba, S. Pencilled Beauty, S. Comet, large and pure white, and the rich and bright S. Rose Beauty. Some delightful St. Brigid anemones were shown by Messrs. Reamsbottom and Co., Alderborough, Geashill, King's Co., Ireland.

Messrs. Seagrave and Co., Sheffield, set up a good selection of violas in a pretty fashion in bowls, with neat sprays of foliage. The Guildford Hardy Plant Company exhibited alpine plants in rock garden fashion, and their Guildford Seedling saxifraga was strikingly pretty. Mr. J. E. Knight, Wolverhampton, was also a large exhibitor of violas. Delightfully fragrant were the stocks Beauty of Nice, Violet Gem, Queen Mary, Queen Alexandra, and the yellow Monte Carlo, exhibited by Messrs. Toogood and Sons, Southampton, the spikes were fine. The eremuri, Primula japonica, P. farinosa, P. Cockburniana, P. Sikkimensis, were prominent beauties from the King's Acre Nursery Company, Hereford.

A very charming display of violas was made by Mr. Howard Crane, Archway Road, Highgate, who set up sweet and fragrant flowers in low pans of a variety; May, Mrs. Crane, Swan, Sultan, Leslie Hancock, Ralph and Lark were all lovely varieties. Messrs. Jas. Backhouse and Son, Lim., York, had a very pretty rock garden, in which they had finely disposed Ramondia pyrenaica, Primula Veitchi, Edraianthus serpyllifolium, Daphne cneorum, hardy cypripediums, Gentiana acaulis and its variety alba, and masses of pure white trilliums and rosy-hued saxifragas.

Messrs. Bees, Lim., Mill Street, Liverpool, had some interesting novelties, chiefly among primulas, and included P. Forresti, P. Sikkimensis, P. Beesiana, somewhat akin to P. japonica, the bright P. Unique, and the very curious plantain-like P. Littoniana, the rosy P. Lichiangensis, the yellow P. Bulleyana, and the white Anemone demissa. Trolliuses were beautifully shown, and in some variety, by Messrs. Jas. Cocker and Sons, Aberdeen, and Anemone alpina sulphurea was well shown by the same firm. From the Craven Nursery, Clapham, Yorks, came masses of Trillium grandiflorum, the lovely little Primula farinosa, Edraianthus serpyllifolium, the minute Androsace pubescens, Daphne rupestris, and other good things. Messrs. J. Cheal and Sons, Crawley, displayed their rosy form of Lupinus polyphyllus, and put up a very fragrant selection of lilacs.

In addition to the plants and cut flowers already mentioned as having been shown by Mr. Amos Perry, this exhibitor contributed the richly-coloured Geum miniatum Perry's variety, Viola Bowles' Blush, and the exquisitely beautiful Lithospermum Heavenly Blue.

TULIPS.

Masses of tulips in bunches do not lend themselves to artistic arrangement, so in reporting this section we can only confine ourselves to the flowers. Messrs. R. H. Bath, Lim., of Wisbech, made a big display, containing many of the gems of the tulip world, varying in colour from La Tulipe Noire, black, to Mrs. Moon, a pretty canary-yellow.

Messrs. Barr and Sons, Covent Garden, filled a long length of tabling with tulip flowers, exhibited in vases, and the brilliant colours of the many varieties were very striking. The quaintly unique English tulips came in for much comment, but the parrot tulips, the lovely cottage tulips, and the May-flowering Darwin tulips, a most delightful section for garden adornment, attracted a good deal of notice.

A highly interesting exhibit of tulips was that from the nurseries of Messrs. Geo. Bunyard and Co., Maidstone. The collection included parrot tulips in variety, as well as bright-coloured May-flowering tulips, and the curious green and yellow tulip viridifolia. Messrs. Hogg and Robertson, Lim., Dublin, included tulips in conjunction with irises and other things, and amongst the former the varieties Zomerschoon, Leghorn Bonnet, and Goldflake were much admired.

The tulips staged by Mr. F. Fitch, gardener to Sir Geo. Faudel-Phillips, Balls Park, Hertford, made a fine display, and this private exhibit compared favourably with anything shown by the trade. The flowers were remarkably fine, and the colours contained every shade to be found amongst tulips. Mr. Fitch also managed to put up his flowers without being so guilty of overcrowding as some other exhibitors.

Highly interesting to the tulip expert was the collection of seedling tulips staged by Mr. A. D. Hall, F.R.S., of Harpenden; none of the seedlings were named, but some of the colours were very pleasing.

Quite a noble display of tulips was that from the nurseries of Messrs. Sutton and Sons, Reading, and the flowers set up in tiers showed themselves off to perfection. They would have looked quite as well if some of the vases had contained fewer flowers, but the numerous beautiful varieties represented came in for a good deal of favourable attention.

Mr. Amos Perry, Enfield, sent a compact but rather crowded collection of tulips, which included both parrot and May-flowering Darwins.

Messrs. Alex. Dickson and Sons, of Belfast, filled a long length of tabling with tulip

ROYAL SHOW

LIVERPOOL,
June 21st to 25th, 1910.

71st ANNUAL EXHIBITION of Live Stock, Poultry and Farm Produce; Jumping, Horse-Shoeing and Butter-Making Competitions, Agricultural Education, Forestry and Horticulture.

HORTICULTURE
ENTRIES CLOSE ... JUNE 4.
Live Stock Entries close May 20;
Poultry Produce and Competitions,
May 31.

Prize-sheets and Entry Forms will be forwarded on application to
THOMAS McROW, Secretary.
Royal Agricultural Society of England,
16, Bedford Square, London, W.C.

CHESTERFIELD FLOWER SHOW
WEDNESDAY, 27th July, 1910.
Affiliated with the National Rose Society.
Special large Marquee for staging Roses.
Schedules on application.
CHAS. WM. HADFIELD, Secretary.

CROYDON HORTICULTURAL SOCIETY.
Affiliated to the Royal Horticultural and National Rose Societies.
The CROYDON FLOWER SHOW will be held on WEDNESDAY, July 6th, in the PARK HILL RECREATION GROUND (by permission of the Corporation of Croydon). Schedules post free.
A. J. ROFFEY, Secretary, 55, Church Rd., Croydon.

WOLVERHAMPTON GREAT FLORAL FETE,
July 12, 13, and 14, 1910.
£900 IN PRIZES.
Schedules on application to the Secretary.

GRAND YORKSHIRE GALA, YORK.
June 15th, 16th, and 17th, 1910.
£800 OFFERED IN PRIZES.
£275 for Orchids, Stove and Greenhouse Plants.
£175 for Pelargoniums, Carnations, Begonias, etc.
£225 for Roses, Cut Flowers, etc.
£125 for Fruit and Vegetables.
FOUR GOLD MEDALS AND PREMIER PRIZE FOR TRADE EXHIBITS.
Entries close 8th June. For Schedules apply to
FRED. AREY, Secretary, Davyhall Chambers, York.

HANLEY PARK, STAFFORDSHIRE.
July 6th and 7th, 1910.

FOURTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes, Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for "TRADE EXHIBIT"
(For particulars see page 10 in Schedule).
Valuable Special Prizes offered by the principal Firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.

Schedules, post free, on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

NORTHAMPTON MUNICIPAL HORTICULTURAL SOCIETY.

GRAND EXHIBITION OF
FLOWERS, FRUITS, and VEGETABLES,
BEES, BIRDS, POULTRY, and RABBITS.
AUGUST 3rd and 4th, 1910.
At
ABINGTON PARK, NORTHAMPTON.
Prizes to the Value of £300.

Schedules on application to
JAS. B. PALMER, Secretary,
36, Cyril Street, Northampton.

IPSWICH AND EAST OF ENGLAND HORTICULTURAL SOCIETY.

THE SUMMER SHOW
will be held in the
ARBORETUM, IPSWICH, THURSDAY, July 7th.

SILVER CHALLENGE CUP FOR ROSES
(OPEN).

Applications for space to
HAROLD R. SMITH, Secretary,
16, Arcade Street, Ipswich.

SOUTHAMPTON ROYAL HORTICULTURAL SOCIETY.
SUMMER SHOW, July 5 and 6.
Roses, Sweet Peas, Miscellaneous Plants and Flowers Fruit, and Vegetables.
Trade Exhibits especially invited.
C. S. FUIDGE, Secretary.
7, Silverdale Road, Southampton.

TAUNTON HORTICULTURAL AND FLORICULTURAL SOCIETY.

The next ANNUAL EXHIBITION will be held on THURSDAY, August 11.

Schedule and particulars from—
R. A. GOODMAN,
3, Hammet Street.

THE PERPETUAL FLOWERING CARNATION SOCIETY.

The SPRING SHOW of CARNATIONS will be held in the ROYAL HORTICULTURAL HALL, Vincent Square, S.W., on THURSDAY, June 9th.

Admission from One to Six p.m., One Shilling.

Schedules and full particulars from Mr. E. F. HAWES, Royal Botanic Gardens, Regent's Park, London.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

flowers in bewildering variety, which looked extremely well before the sun became too powerful for them. To name even a portion of the varieties staged would take too much space, but every section of May-blooming tulips was represented by finely-developed blooms.

GREENHOUSE PLANTS.

There were few things in the show that were more admired than the beautiful collection of amaryllis staged by Messrs. Robert P. Ker and Sons, Liverpool. Without exception the flowers were very fine, and many delicate shades of colour were represented. A few of the novelties were Cynthia, The Chancellor, The Queen, Persephone, and Rosey Belle.

Mr. H. J. Jones, of Lewisham, set up some bunches of zonal pelargoniums, and a mass of spiræas, which included the varieties Compacta and Peach Blossom.

Messrs. Webb, of Stourbridge, made a fine display with their calceolarias, gloxinias, and Cineraria stellata. The plants were set up in a kind of bank, and the specimens throughout were stamped with the mark of good cultivation.

Both quaint and beautiful were the sarracenias staged by Mr. A. J. A. Bruce, Chorlton-cum-Hardy, and an Award of Merit was granted to a variety called Willmottæ. The same firm also showed plants of the new blush marguerite, Queen Alexandra.

Messrs. H. B. May and Sons, Upper Edmonton, staged a pretty little collection of clematises in pots, which included the varieties Marcel Moser and Lord Wolseley. The same firm showed also some artificial-looking sprays of zonal pelargoniums. Bottle-brush trees, honeysuckle-scented azaleas, new hydrangeas, boronias, and gerberas—the Transvaal daisy—came from Messrs. Stuart Low and Co., and in the midst of the flowers, under a bell-glass, were fruits of the new fruit, "Lowberry," which is said to be sweeter in flavour than the Loganberry.

Five inches across was the size of one of the flowers staged in the magnificent group of cinerarias exhibited by Messrs. James Carter and Co., Holborn, but there were many others only slightly less, and the colours throughout were unique in variety and brilliancy. Situated at the opening of the tent, this group was the first of the good things which visitors saw when they arrived. The Holborn firm also staged plants of a new white petunia, Queen May, a fine lot of tuberous begonias, and one of the finest lots of gloxinias we have seen for a long time. To complete this charming exhibit was a compact group of streptocarpuses, the flowers of which were most delicate in their colouring.

Interesting and choice in the extreme were the plants staged by Messrs. J. Veitch and Sons, Chelsea, and not the least delightful were the new hybrid gerberas, which were highly approved by the visitors. Gloxinias in various colours were included, as well as Streptocarpuses achimeniflorus, giganteus, albus, and roseus. Other plants which attracted much attention were Calceolaria Buttercup, Exacum macranthum, Cinerarias Snowball and flavescens, Feltham Bouquet, and Decorator. It is safe to say that no other exhibit of its kind in the show contained a greater variety of interesting and well-grown plants.

A group of schizanthus from Messrs. Garaway and Son, Clifton, Bristol, attracted attention, the plants staged being of large size and well grown.

Mr. T. Hobbs, gardener to V. Philips, Esq., Orpington, set up a group of nicely-grown calceolarias, from the appearance of which it was evident that they had received careful attention at the hands of the grower.

We were reminded of past Temple Shows by the group of greenhouse pelargoniums staged by Mr. W. J. Godfrey, Exmouth, and amongst the most striking varieties were Captivation, Black Prince, and Mrs. W. J. Godfrey. The same firm showed some pretty little amaranthuses, and a big lot of the satiny-flowered Oriental poppies.

A healthy-looking group of greenhouse calceolarias was set up by Mr. W. Noakes, Selsdon Park, Croydon, but the arrangement was a little too flat to be fully effective.

A portion of the hydrangeas staged by Messrs. W. Bull and Sons, Chelsea, were starch blue, and the remainder flesh pink, the trusses in each case being very fine.

A bold group of calceolarias, exquisitely coloured, and representing a richly spotted strain, was set up in No. 4 tent by Messrs. J. Veitch and Sons; some of the crimson and strawberry-coloured varieties were very handsome. The Old Man Cactus (Pilocereus senilis), from Messrs. H. Cannell and Sons, Swanley, was an attractive curiosity, but the pink spiræa, Peach Blossom, was far more graceful, while the large batch of the elegant golden-flowered Calceolaria Clibrani showed the usefulness of this hybrid for greenhouse and conservatory decoration.

For many years a great deal of patient work has been done at Aldenham in the improvement of the streptocarpuses, and on this occasion a fine group of these improved varieties was staged by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House. Some of the flowers are of unusual size, and the plants are neat, and very free flowering; some are blue, others white, some deep rose-red, and others white marked with rose or blue, and some are light blue with deeper throat markings. Mr. H. N. Ellison, West Bromwich, displayed the new plumose nephrolepis in variety, gymnogrammas, davallias, adiantums, and other interesting ferns.

A selection of bright-hued seedling pelargoniums from Mr. Parker, gardener to P. J. Fry, Esq., Abbots Leigh, Bristol, contained a number of huge branched spikes, the secondary trusses extending from the head of the original truss. Dracæna Bruanti Souv. de Francois Buysse, heavily marked with greenish-gold on a green ground, was shown by M. Emile Vergantern, Melle, Ghent; it appears to be a very useful and elegant variety.

Messrs. J. Peed and Son, Norwood, were represented in this section by a long group of streptocarpuses, and a fine strain of gloxinias, some of the flowers being of wonderful size and colour. Mr. G. Gilbert, Queen's Road, Hastings, showed Pelargonium Achievement, with a few other greenhouse plants. Messrs. W. and J. Brown, Peterborough, made a miscellaneous contribution, in which the hybrid Dianthus Napoleon III., with deep red flowers, was conspicuous; Heliotrope Lord Roberts, Gaillardia Lady Rolleston, deep yellow, lilacs, verbenas, etc., also entered into the arrangement.

The bright scarlet Pelargonium Jas. T. Hamilton was finely displayed by Messrs. W. H. Rogers and Son, Lim., Southampton. Yellow arums and a selection of hybrid gerberas were set up by Messrs. Felton and Son, Hanover Square, W. Messrs. Wm. Bull and Sons, Chelsea, made up a bright group of amaryllis associated with aralias; King George V. was an orange scarlet flower of great size.

Across the top end of the big tent Messrs. Sutton and Sons, Reading, had a wondrously gorgeous exhibit that provided a feast of glowing colours. The central feature was a great rounded mound of the firm's new and elegant cinerarias named Reading Gem, and the stellata varieties in a great variety of delicate shades of blush, pink, rose, heliotrope, and blue. The fragrance of this floral mound was delightful. Superb calceolarias, gloriously coloured and carrying masses of big bold blooms, were used to make a mound on each side of the cinerarias. The end mounds were of schizanthuses—a splendid large-flowered strain of these useful flowers, gloxinias, tuberous begonias, and the elegant B. Lloydi; and nemesias, and clarkias were effectively used to fill up between the mounds. Begonia Marie Boucher, a pendant scarlet-flowered variety, suitable for baskets, was shown well by Mr. J. Friend, gardener to the Hon. Mrs. Glen, Albury Hall, Herts, and was represented by big examples in pans and baskets. Some old-fashioned pyramidal Indian azaleas, freely-flowered, were submitted by Mr. Chas. Turner, Slough.

FRUIT AND VEGETABLES.

Fruit trees in pots are a standard institution at the Temple Show, and once again they were well shown by Messrs. T. Rivers and Sons, Sawbridgeworth. Never do we remember seeing more healthily grown trees, and the brightly coloured fruits of nectarines Cardinal, Early Rivers, and Seedling No. 101 looked very tempting. Peaches were represented by Peregrine, Kestrel, a new variety, and a few well-fruited cherry trees completed the group. Hidden away with a bank of carnations on one side, and a group of hardy flowers on the other, we came across a lot of fresh-looking cucumbers from Mr. S. Mortimer, Farnham, who also showed good specimens of tomatoes, Sunrise and Improved Sunrise. Mr. A. J. Harwood, of Colchester, showed some fine heads of asparagus, but the edible portion of the above was not the biggest part.

Messrs. Laxton Brothers, of Bedford, were represented by an interesting collection of picked strawberries in baskets, which looked almost too tempting to be resisted. We were not privileged to taste, but, so far as appearance went, we were much attracted by George Munro, Bedford Champion, and Laxton's Connoisseur. The Thatcham School of Gardening sent a collection of forced vegetables and salads, the quality of which was fair.

In his style, that is too well known to need description, Mr. E. Beckett, gardener to the Honourable Vicary Gibbs, Aldenham House, set up a collection of vegetables with quality so good that we can hardly particularise; but perhaps the things which attracted observers most were some really grand specimens of Sutton's Perfection tomatoes, pearly white Magnum Bonum cauliflower, cucumbers in the best of condition, Duke of Albany peas, and Moore's Cream marrows. To say that it was a grand display for the time of year is no mere figure of speech, and the quality of the produce throughout was equalled by the tasteful mode of arrangement. One expert in our hearing described it as a "very pretty lot," and we agree with him.

FERNS.

A most interesting group of ferns was staged by Messrs. Thomas Rochford and Sons, Broxbourne, the most conspicuous plant in the exhibit being Nephrolepis lycopodiodes, a very compact-growing form. Other ferns which attracted attention were Polypodium sporadacarpum cristatum, and Cyrtomium Rochfordi, a fine type of holly fern with splendid constitution. A fine collection of ferns was exhibited by Messrs. J. Hill and Son, Lower Edmonton, and included in it we noticed splendid pieces of Polypodium Knightæ, Nephrolepis elegantissima, Asplenium marginatum, Balantium culcita, and Davallia fijiensis robusta. Selaginellas in variety was also included in the group, which was much admired.

On the other side of the tent was a grand lot of ferns, exhibited by Messrs. H. B. May and Sons, Upper Edmonton. Delightfully cool looking was the verdant hue of Nephrolepis Marshalli, Davallia solida superba, Polypodium Knightiæ, and Adiantum cardiochlæna. The above were only a few of the different ferns which, as a whole, made up a very interesting group.

OUTDOOR EXHIBITS.

The arrangement of the outdoor groups was altered a little to last year, but the various groups and rock gardens were very much admired. Messrs. J. Cheal and Sons, Crawley, made up a very natural-looking rock garden with flowers blooming in the pockets, and round the outsides were tall acers, lilacs, clematises, and other flowering trees and shrubs. A very fine group of rhododendrons, interspersed with Japanese maples, was set up by Messrs. J. Waterer and Sons, Lim., Bagshot. Brilliant colours were displayed in the flowers, and the group was arranged with much taste.

Mr. L. R. Russell, of Richmond, had a large outdoor group, in which acers, ivies, and flowering trees and shrubs were shown in bewildering variety.

Messrs. Paul and Son, Cheshunt, sent standard lilacs, rhododendrons, and azaleas in variety along with daphnes and other interesting plants. Quite a feature in the outdoor groups was the exhibit from Messrs. J. Veitch and Sons, Chelsea. In this collection was a fine display of Anchusa italica Dropmore variety, charming primulas, schizanthuses, azaleas, calceolarias, and hydrangeas.

Messrs. W. Cutbush and Son, Highgate, surpassed any of their former efforts with an outdoor rock garden. There was a natural-looking pool with plants that grow at the water's edge, and a big bank behind with a cave, containing ferns and flowers, which looked as if they had originated there. The same firm also showed specimens of their well-known topiary work in box and yew.

Very bold in design was the rock garden arranged by Messrs. Pulham and Sons, London, and the stones, water, and plants occupied very natural-looking positions. In the rock arrangements not the least effective was that fixed up by Messrs. R. Wallace and Co., Colchester, and a very unique part of it was a stone pavement, flanked on either side by interesting flowers of an old-fashioned type.

The group of plants set up by Mr. R. C. Notcutt, Woodbridge, was much admired, which was not surprising considering the varied character of the flowers contained in it. Messrs. J. Piper and Sons, Bayswater, were represented by clipped trees, and Messrs. R. and G. Cuthbert, Southgate, had a fine group of May-flowering tulips in pots, in which many charming varieties were represented.

The Pigmy trees from Messrs. Barr and Sons, Covent Garden, did not look a day younger or older than they were a year ago, and the group of ferns, flowering plants, standard heliotropes, fuchsias, and pelargoniums arranged by Messrs. H. B. May and Sons, Upper Edmonton, had a very pleasing effect.

Messrs. W. Paul and Son, Waltham Cross, had a fine group of flowering shrubs, and Mrs. C. Elliott had a rock garden in which the flowers appeared to be growing amid grey stones and granite chippings. The outdoor rockery set up by Mr. M. Prichard, Christchurch, contained many gems of the alpine section, and Messrs. Heath and Sons, Cheltenham, were represented by a rock garden arranged with some taste. Messrs. W. Artindale and Son, Sheffield, arranged a bed of violas, a unique method of presenting these flowers to public notice, and the flowers being of exceptionally high quality, the arrangement received much attention from the visitors.

A big group of bottle-brush trees was set up outside by Messrs. Stuart Low and Co., and the same firm had a pretty arrangement of roses of the cluster type. Standard specimens in full bloom made a background, and underneath were dainty little dwarf plants of Orleans rose, a pretty pink variety.

One of the most interesting of the outdoor features was the Japanese garden, constructed by Messrs. James Carter and Co., Holborn. This was near the Embankment entrance and was a charming arrangement, entered under a bamboo porchway flanked by numbers of dwarfed and aged cupressus, pines, oaks, maples, larch, etc. From the entrance a pathway ran alongside a little central lake to the graceful wooden bridge spanning the water, and across to the exit by a rustic gateway. A further path beyond led to the tortoise garden, an umbrella-like, thatched tea house, and a pretty little rock garden literally foaming with white masses of Saxifraga pyramidalis, and so on round the extreme end of the lake to the exit again. The sides of the lake and the surrounding banks were dotted here and there with Japanese lilies, irises, fuchsias, dwarf pines, maples, etc., while stretching out their necks towards the goldfish in the water were several storks composed of trained larch. Little temples and fine stone lanterns from Japan added other realistic touches to this clever and well-conceived design.

OFFICIAL LIST OF AWARDS.

Gold Medals.—To Leopold de Rothschild, Esq., Gunnersbury Park, Acton (gardener, Mr. G. Reynolds), for Vanda teres; to the Hon. Vicary Gibbs, Elstree (gardener, Mr. Beckett), for vegetables; to F. Menteith Ogilvie, Esq., Oxford, for orchids; to Messrs. Sutton and Sons, Reading, for flowering plants and tulips; to Messrs. J. Veitch and Sons, Chelsea, for flowering plants and foliage plants; to Messrs. H. B. May and Sons, Edmonton, for exotic ferns; to Messrs. William Paul, Waltham Cross, for roses; to Messrs. T. Rivers and Sons, Sawbridgeworth, for fruit trees in pots; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. R. Wallace and Co., Colchester, for rock garden and herbaceous plants; to Messrs. Paul and Son, Cheshunt, for roses; and to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Sherwood Cup.—To Sir J. Colman, Bart., Reigate, for orchids.

Silver Cups.—To Messrs. W. Cutbush and Son, Highgate, cut bushes, alpines, etc.; to Messrs. Barr and Sons, Surbiton, for tulips and hardy plants; to Messrs. J. Waterer and Son, Bagshot, for rhododendrons; to Messrs. J. Carter and Co., Holborn, for Japanese garden and flowering plants; to Mr. L. R. Russell, Richmond, for trees and foliage; to Mr. C. Turner, Slough, for roses and azaleas; to Mr. H. Burnett, Guernsey, for carnations; to Sir G. Faudel-Phillips, G.C.I.E., for tulips; to Messrs.

Hobbies, Dereham, for roses; to Messrs. G. Mount and Sons, Canterbury, for roses; to Messrs. W. Fromow and Sons, Chiswick, for maples; to Messrs. Hill and Son, Edmonton, for ferns; to Messrs. Mansell and Hatcher, Rawdon, for orchids; to His Grace the Duke of Marlborough, for orchids, to Mr. J. T. Clifton, Lytham, for orchids, to Mr. A. Perry, Enfield, for herbaceous plants, etc.; to Messrs. S. Low and Co., Enfield, for orchids, roses, etc., to Messrs. Cuthbert, Southgate, for azaleas; to Messrs. Peed and Son, Streatham, for caladiums, etc.; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Backhouse and Sons, York, for alpines; to Mr. A. F. Dutton, Iver, for carnations, etc.; to Messrs. J. Veitch and Sons, Chelsea, for trees and shrubs; to Mr. M. Prichard, Christchurch, for alpines.

Silver-Gilt Flora.—To Messrs. A. Dickson and Sons, Belfast, for new roses and tulips; to Mr. G. Reuthe, Keston, for tulips, rhododendrons, and hardy flowers; to Messrs. Artindale and Son, Sheffield, for hardy flowers; to Mr. R. C. Notcutt, Woodbridge, Ipswich, for shrubs; to Messrs. Blackmore and Langdon, Bath, for begonias; to Messrs. F. Cant and Co., Braiswick, Colchester, for roses; to Mr. G. Langhe, Hampton, for carnations; to Messrs. R. P. Ker and Sons, Liverpool, for amaryllis.

Silver-Gilt Banksian.—To Messrs. G. Jackman and Son, Woking, for clematis, etc.; to Mr. W. H. Page, Tangley Nurseries, Hampton, for carnations; to Messrs. Thos. S. Ware, Feltham, for hardy flowers, etc.; to Messrs. J. Cheal and Son, Crawley, for rock garden, etc.; to Mr. A. J. Bruce, Chorlton-cum-Hardy, for sarracenias; to Mr. C. Engelmann, Saffron Walden, for carnations; to Mr. W. H. Lancashire, Guernsey, for carnations; to Mr. E. V. Low, Haywards Heath, for orchids.

Silver Flora.—To Messrs. Bakers, Wolverhampton, for hardy flowers; to Messrs. R. H. Bath, Lim., Wisbech, for hardy flowers; to Messrs. G. and A. Clark, Dover, for hardy flowers; to Messrs. E. W. King and Co., Coggeshall, for sweet peas; to Messrs. Toogood and Sons, Southampton, for stocks; to Mr. W. E. Alsen, Waterlooville, Hants, for sweet peas; to Mr. Howard H. Crane, Highgate, for violas; to Mr. Frank Lilley, Guernsey, for gladioli and irises; to Messrs. G. Bunyard and Co., Maidstone, for tulips and hardy flowers; to Messrs. Hogg and Robertson, Dublin, for tulips, etc.; to Messrs. Jas. Locke and Sons, Aberdeen, for trollius, etc.; to the Misses Hopkins, Shepperton, for rock garden; to Messrs. Thos. Rochford and Sons, Broxbourne, for new ferns; to Mr. H. Hemsley, Crawley, for hardy flowers; to Mr. E. J. Johnstone (gardener, Mr. Paskett), Groombridge, for Malmaison carnations; to Mr. A. D. Hall, Harpenden, for tulips; to Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; to Messrs. H. Cannell and Sons, Swanley, for greenhouse plants, etc.; to Mr. W. J. Godfrey, Exmouth, for poppies, etc.; to The Craven Nursery Co., Clapham, Lancashire, for alpines; to Messrs. L. Hughes Jones and Peers, Thatcham, for salads, etc.; to Mr. B. Bell, Guernsey, for carnations; to Mr. C. Elliott, Stevenage, for hardy flowers; to Messrs. Gunn and Sons, Olton, for violas and hardy flowers; to Mr. A. J. Harwood, Colchester, for asparagus, etc.; to Messrs. Robert Sydenham, Lim., Birmingham, for sweet peas; to Messrs. Bees, Lim., Liverpool, for primulas and alpines; to Messrs. Bull and Sons, Chelsea, for orchids, foliage plants, etc.; to Messrs. Dobbie and Co., Edinburgh, for pansies, violas, and sweet peas; to Messrs. B. Ladhams, Lim., Southampton, for hardy herbaceous plants; to Messrs. Piper and Son, Bayswater, for trained trees and Japanese maples.

Silver Knightian.—Mr. S. Mortimer, Farnham, for cucumbers, tomatoes, carnations; Messrs. Laxton Bros., Bedford, for strawberries; Mr. R. Stevenson, Cambridge, for asparagus.

Silver Banksian.—Messrs. Storrie and Storrie, Glencarse, auriculas and polyanthus; Mr. R. Ashworth, Manchester, for orchids; Messrs. Pulham and Son, Oxford Street, rock gardens; Messrs. Heath and Son, Cheltenham, for rock garden; Messrs. G. Mallett and Co., Cheddar, for alpines, herbaceous, etc.; Messrs. Carter Page and Co., London Wall, dahlias, annuals, violas; Messrs. J. Forbes, Lim., Hawick, herbaceous plants; Messrs. G. Gibson and Co., Bedale, herbaceous and alpines; the Guildford Hardy Plant Nursery, Guildford, herbaceous and alpines; Messrs. Kelway and Sons, Langport, for tree pæonies and pyrethrums; Messrs. Seagrave and Co., Sheffield, violas and pansies; Messrs. A. Young and Co., Elgin, anemones; Mr. H. Correvon, Geneva alpines.

Bronze Flora.—Messrs. W. and J. Brown, Peterboro', for herbaceous; the King's Acre Nursery, Hereford, alpines and herbaceous; Messrs. E. Webb and Sons, Stourbridge, flowering plants; Messrs. Young and Co., Cheltenham, carnations; the Hon. Mrs. M. Glyn, Ware, for begonias; Mr. H. J. Jones, Lewisham, flowering plants; Messrs. Whitelegg and Page, Chislehurst, tulips, alpines, and sweet peas.

NEW PLANTS.

Orchid Committee Awards.

First Class Certificate to Cattleya Mendeli, var. Princess Victoria, from Messrs. Mansell and Hatcher, Lim., Rawdon, Yorkshire; to Cattleya Lawrenceana, var. Mary Regina and Sobralia Charlesworthi, from Messrs. Charlesworth and Co., Haywards Heath, Sussex; Odontoglossum Memoria King Edward VII. and Odontoglossum Memoria Baron Schroder, from Messrs. Sander and Sons, St. Albans; Odontioda King George V. and Odontoglossum eximium Empress of India (O. crispum, O. Ardentissimum), from Mons. Ch. Vuylsteke Loochristi, Ghent, Belgium.

Botanical Certificate to Bifrenaria bicornaria and Lycaste Peruviana, from Messrs. Sander and Sons.

Award of Merit to Cattleya Mossiæ, var. Magali Sander, from Messrs. Sander and Sons, St. Albans; Laelio-Cattleya Luminosa magnifica, from the Duke of Marlborough, Blenheim House, Woodstock; Odontioda Royal Gem (O. Vuylstekæ, O. Ardentissimum) and Odontoglossum Promerens (O. crispum, O. eximium), from Mons. Ch. Vuylsteke, Loochristi, Ghent, Belgium; Cattleya Mendeli Queen Maud, from Messrs. Charlesworth and Co., Haywards Heath, Sussex; Lælio-Cattleya Aphrodite Mark Hambourg, from T. Clifton, Esq., Lytham; Odontoglossum eximium var. Emperor, from Messrs. Sander and Sons, St. Albans.

Floral Committee Awards.

Award of Merit to Rhus typhina laciniata, Mr. R. C. Notcutt, Woodbridge; Rose excelsa, from Messrs. Paul and Son, Cheshunt; Rose Duchess of Westminster, from Messrs. A Dickson and Sons, Newtownards; Begonia Rose Queen, Messrs. Blackmore and Langdon, Bath; Rhododendron Alice, Messrs. J. Waterer and Sons, Bagshot; Sarracenia Willmottæ, Mr A. J. Bruce, Manchester, Cytisus Dallimorei, Royal Gardens, Kew; Marguerite Mrs. F. Sander, Messrs. Sander and Sons, St. Albans; Azalea mollis sinensis Floradora, Messrs. Cutbush, Southgate; Rhododendron Princess Juliana, from Messrs. J. Waterer and Sons, Bagshot.

FORTHCOMING ENGAGEMENTS.

WEDNESDAY, June 1.—Royal Society of Arts.

THURSDAY, June 2.—Linnean Society.

SATURDAY, June 4.—French Horticultural Society of London.

TUESDAY, June 7.—Royal Horticultural Society; Committee meet at 12 o'clock; lecture at 3 p.m. on "Survivals Among Plants of the Past," by Rev. Prof. G. Henslow, M.A., V.M.H.; Scientific Committee at 4 o'clock.

WEDNESDAY, June 8.—East Anglian Horticultural Society.
Royal Society of Arts.
Birmingham Summer Show.

THURSDAY, June 9.—British Gardeners' Association (London Branch) Excursion.

SATURDAY, June 11.—R.H.S. Gardens Club; Annual meeting at Wisley Gardens.

MONDAY, June 13.—United Horticultural Benefit and Provident Society.

WEDNESDAY, June 15.—York Floral Fete and Gala; three days.

THURSDAY, June 16.—Linnean Society.
Dundrum Horticultural Society.

BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.

EFFECTIVE, PRACTICAL CONSERVATORIES.

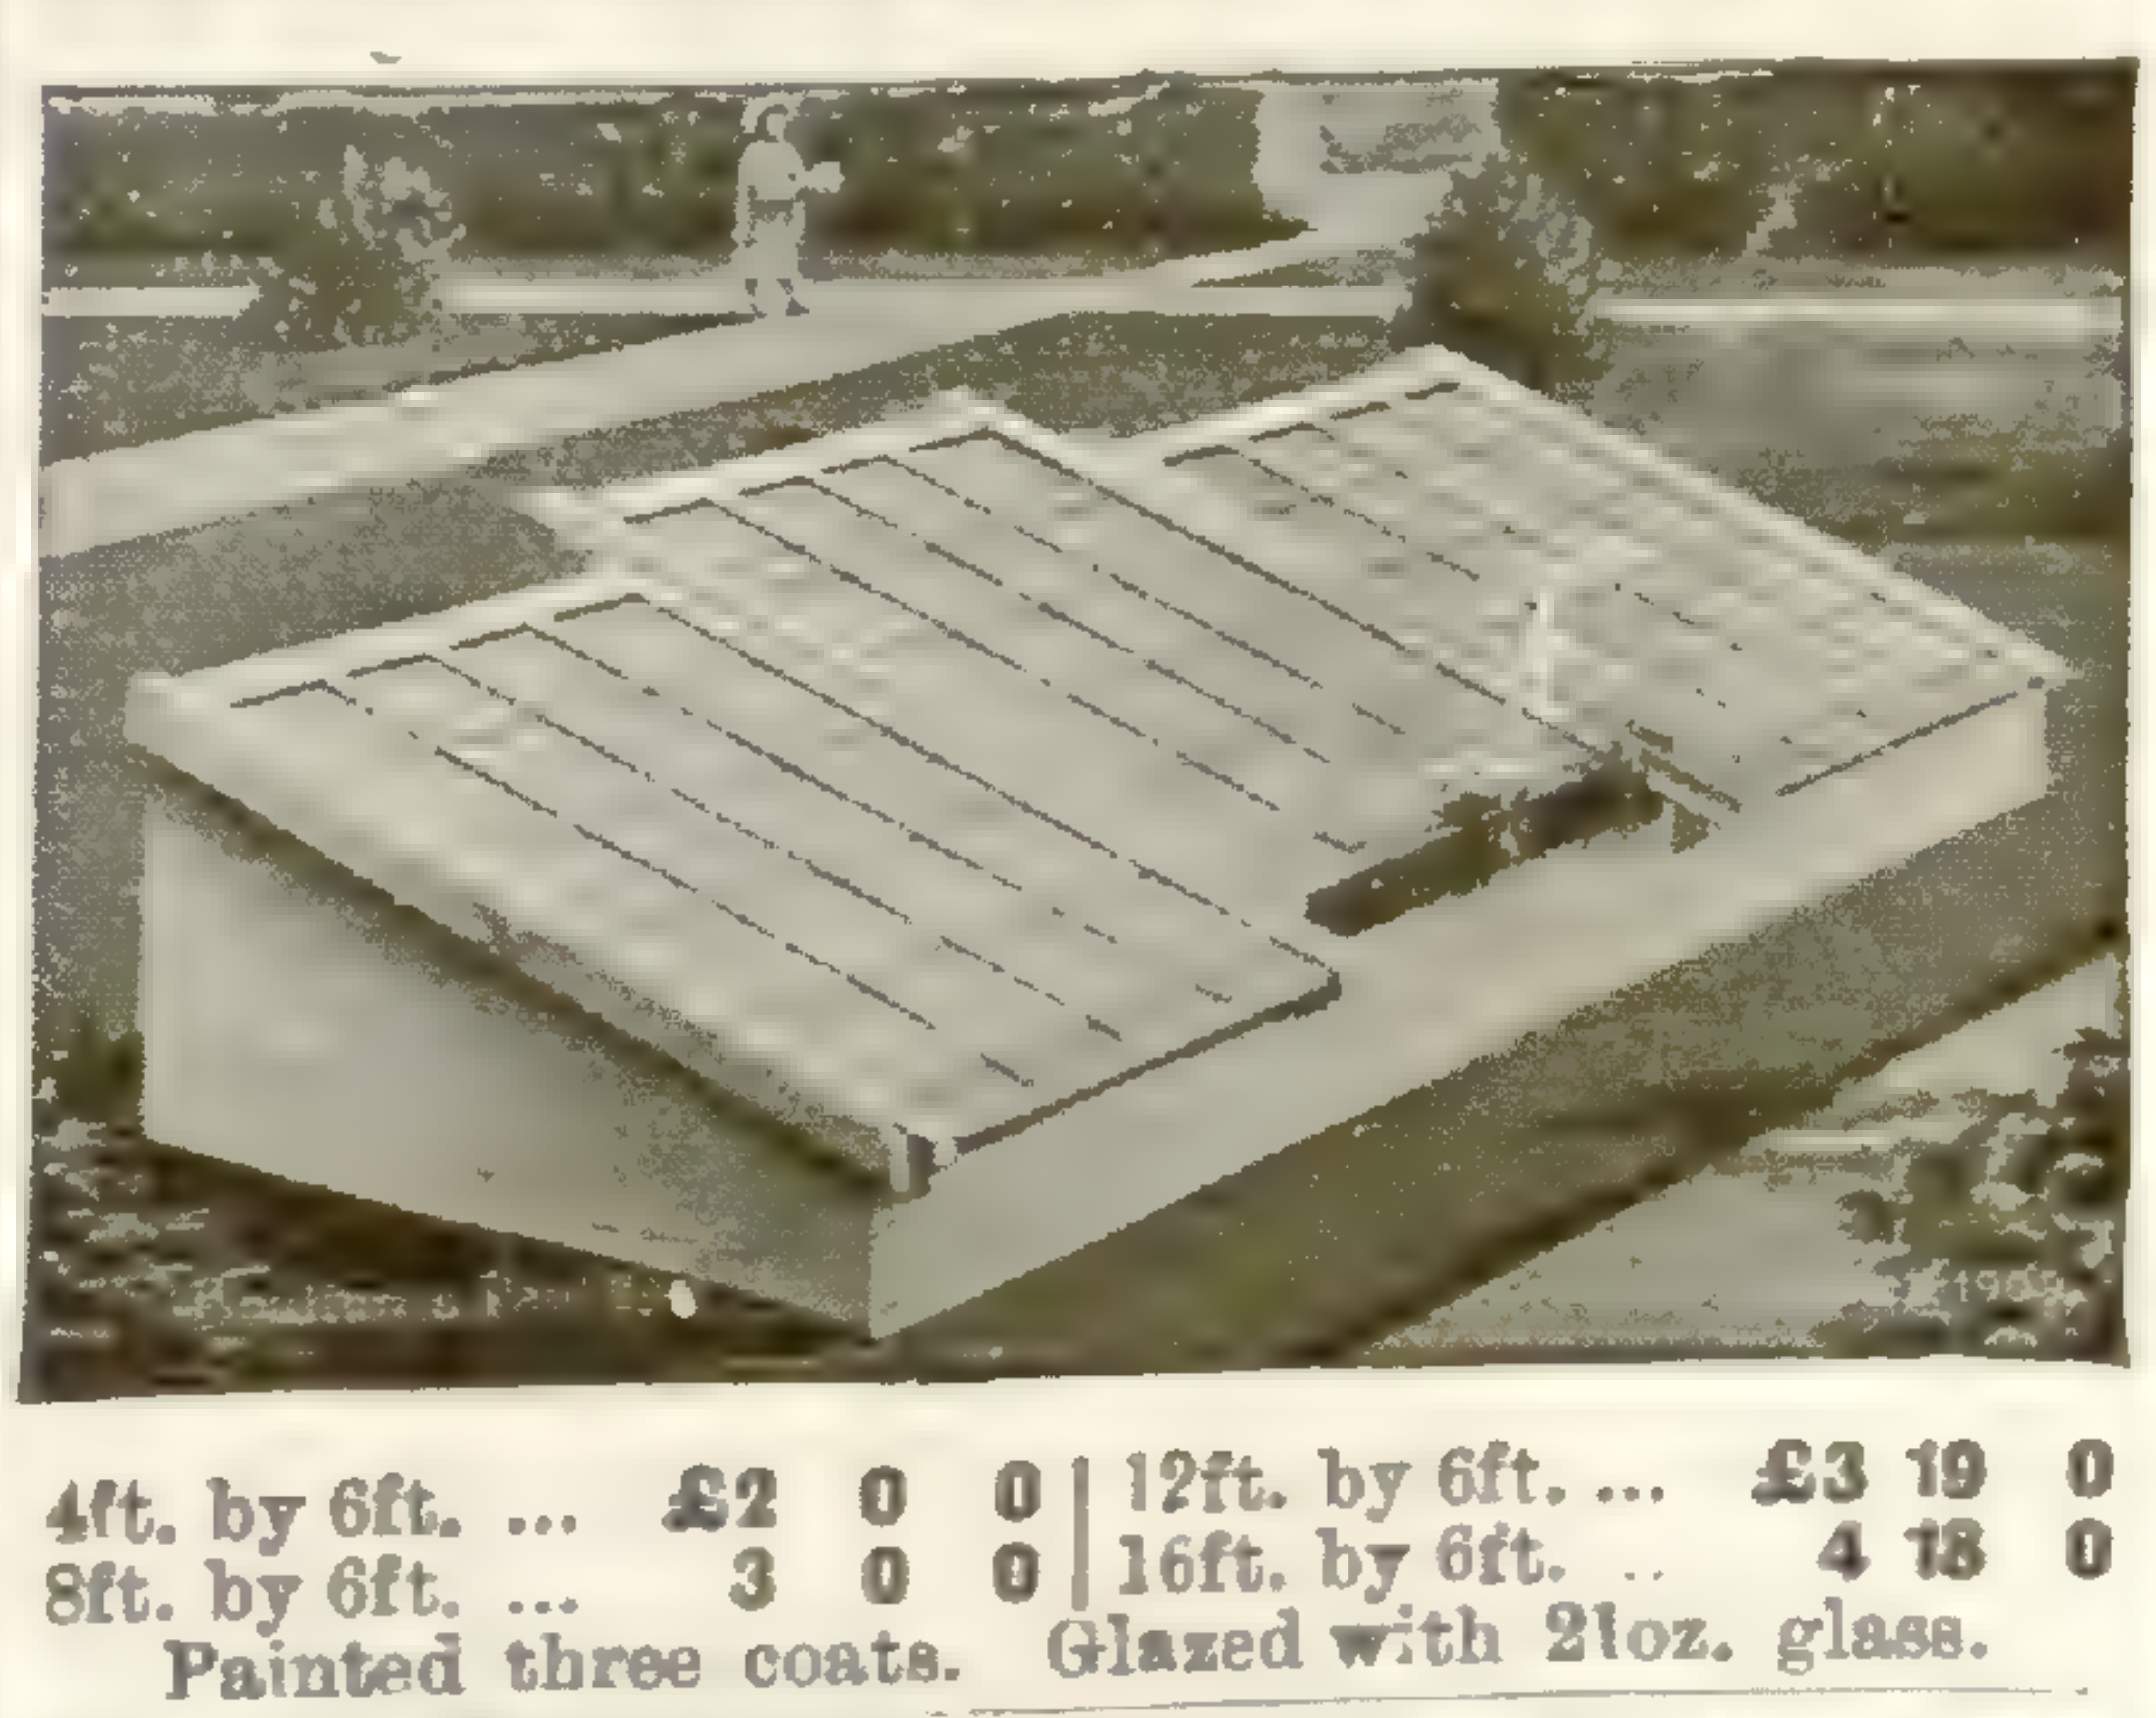
Boulton & Paul

Ladies and Gentlemen waited upon by appointment.

HEATING APPARATUS installed by experienced workmen in Horticultural, Public, and Private Buildings.

GARDEN FRAMES in Great Variety always in Stock.

No. 75.—MELON and CUCUMBER FRAME.



4ft. by 6ft. ... £2 0 0 | 12ft. by 6ft. ... £3 19 0
8ft. by 6ft. ... 3 0 0 | 16ft. by 6ft. .. 4 18 0
Painted three coats. Glazed with 21oz. glass.

No. 77.—VIOLET FRAME, 6ft. by 4ft. Similar to No. 75, with Two Lights... 35/-

SEND FOR ILLUSTRATED PRICE LISTS FREE.

GREENHOUSES FOR AMATEURS.

Boulton & Paul

No. 49A.—Span, 10ft. by 8ft. £11 10 0
No. 47A.—Lean-to, 10ft. by 7ft. £9 10 0
These Houses are sent out well made, painted three coats, Glazed 21oz. glass, and Carriage Paid.

CARRIAGE PAID on orders of 40/- value to most Goods Stations in England.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CROQUET LAWNS.—B. J., Worcester: We gave a full account of the setting out of a croquet lawn, with all the measurements and distances needed, in our issue of May 1, 1909, on page 339.

POINSETTIA CUTTINGS.—L. F. W., Leicester: If the young shoots are about three or four inches long they are quite fit for removal. Use a sharp knife and remove them with a little heel of old wood attached. Insert them singly and firmly in small pots of sandy soil, and place in a propagating case. They will soon root, and should then be potted and given a light position in a pit or low house.

PUNCTURED CUCUMBER LEAVES.—R. A., Newbury: We are making further investigations, but need more material for this purpose, fully grown leaves being necessary. We believe, however, that the damage is due to the bites of some insect pests, such as earwigs or cockroaches. Set traps for these, fumigate the house, and cut away the affected parts as soon as new growths can be trained into position.

THRIPS ON MILTONIAS.—M. E. G., Repton. Thrips seem to have a special liking for the leaves of Miltonia vexillaria, therefore the plants should be carefully examined not less often than once a week, so that steps may be taken promptly to dispose of the pest directly it is seen. Dipping in a diluted nicotine preparation is the best method to employ, but care must be taken not to allow any of the mixture to enter the compost. If there are flowers on the plants then sponging must be resorted to, following this by dipping at intervals of ten days, as soon as the flowers have faded.

DISEASED IRISES.—J. J., Chelmsford: We cannot tell precisely what is the matter with your irises unless we have the opportunity of inspecting specimens. We can only presume that your soil is heavy and wet, and that as a consequence the plants set out last year suffered considerably from the effects of a cold damp winter. If we are correct, then the best you can do is to remove the surface soil so as to expose the rhizomes to the sunlight, and at the same time lightly fork in a good dressing of lime or crushed mortar rubbish.

CLEANING WATER COURSES.—E. J. B., Bungay: The matter is a very serious one and you should point out that not long since the attention of the Board of Agriculture was drawn to the damage stated to be caused by the neglect of certain occupiers of land to keep clean the channels of water-courses and streams running through their land. It has been suggested that the law which deals with this subject is very little known, and the Board consider that it will be useful to publish, in the form of a leaflet, a short summary of the legal position. For mere omission a man is not, generally speaking, answerable by law; and accordingly, at common law, the occupier of land through which a water-course runs is not, as a rule, under any obligation to neighbours whose lands drain into that water-course to prevent or remove any obstruction of the outfall due to merely natural causes (such as silting up of the channel or growth of weeds), and not caused by any action on his part, though, in exceptional cases, e.g., under an inclosure award, such an obligation may sometimes exist. A statutory remedy is, however, provided by the Land Drainage Act, 1847 (10 and 11 Vict. c 38), and it appears to be applicable irrespective of any existing legal obligation on the part of the occupier of the land; but the statutory duty imposed by this Act arises only on notice given by the person injured, and the Act does not create any statutory liability in damages for the injury caused by the occupier's neglect. Section 14 of the Act enacts that where, by the neglect of any occupier to maintain or join in maintaining the banks, or to cleanse and scour or join in cleansing and scouring the channels of existing drains, streams, or water-courses lying in or bounding the lands of such occupier, injury is caused to any other land, the proprietor or occupier of any land so injured may serve a notice on the neglecting occupier requiring him to maintain the banks or cleanse or scour the channels in question. If he neglects so to do, the occupier of the land injured may, after one calendar month from the service of the notice, carry out the necessary work. The cost of the same or a just proportion thereof is to be paid by the neglecting occupier, and payment may be enforced by an order of justices. Section 15 provides that, unless the drain, stream, or watercourse to be cleansed bounds or immediately adjoins the land of the occupier injured by the neglect, a justices' warrant to enter on the defaulter's land in order to carry out the necessary works must be obtained. This warrant is to be granted if the justices are satisfied that the injury has been caused by the neglect of the occupier whose land is to be entered.

BITTEN DAHLIA LEAVES.—C. E., Bournemouth: The leaves of the young dahlias have been bitten by earwigs. These insects sometimes do a great deal of harm to the tender foliage of dahlias, chrysanthemums, pelargoniums, and other garden plants, especially in districts where they seem to be unusually plentiful. Invert some dirty pots, partly filled with dry hay, on short stakes among the plants, and examine those every day in early morning, shaking the trapped earwigs out into a bucket of hot brine, or other mixture that will quickly kill them.

SWOLLEN JUNIPER SHOOTS.—C. S. F., Matlock: The swollen shoots are evidence of an attack of a fungus known as Gymosporangium clavariaforme or by its popular name of Hawthorn Cluster-cups. The gelatinous yellowish material contains crowds of telentospores that germinate presently, and in turn produce secondary spores. These latter are carried by wind, etc., to a favourable host, such as the damp surface of a hawthorn, apple, pear, or similar leaf, and there they germinate, develop, and produce æcidiospores, which, apparently can only germinate upon the juniper and so commence anew the cycle of the life of the fungus. But the mycelium is perennial in the tissues of the juniper, and if allowed to spread it annually does more damage to the tree, and is the means of spreading the plague to thorns, etc. The great and only satisfactory remedy is to attack the fungus in the juniper tree, cutting back the affected parts well beyond all outward evidences of the attack, and after washing the cut surfaces with sulphate of copper, paint them with Stockholm tar. A sharp watch must be kept upon the junipers in the garden, and whenever a swollen stem suggests further development, use the knife promptly.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

F. F., Monmouth; 1, Metrosideros florida; 2, Viola pedata; 3, Thunbergia alata.

E. A. H., Chester.—1, Alyssum saxatile; 2, Dodecatheon media; 3, Cytisus albus.

N. B. J., Hanworth.—1, Odontoglossum concinnum; 2, Syringa rothamagensis.

M. E. W., Shanklin.—1, Ceanothus dentatus; 2, Veronica Hulkeana; 3, Sarracenia purpurea.

R. A., Guernsey.—1, Pittosporum tobira; 2, Eleagnus longipes; 3, Ruscus racemosus; 4, Cestrum elegans.

A. W., Sheffield.—1, Abies nobilis; 2, A. Douglasi; 3, Cupressus macrocarpa; 4, Cedrus Deodara.

H. D., Potter's Bar.—1, Arabis albida fl. pl.; 2, Trollius asiaticus; 3, Gala Beauty Tulip; 4, Leycesteria formosa.

P. C. S., Wimbledon.—1, Palumbina candida; 2, Panax Victoriæ; 3, Adiantum pedatum; 4, Odontoglossum crispum.

C. R. C., Wraysbury.—1, Gasteria verrucosa; 2, Perilla nankineusis; 3, probably Omphalodes intermedia; 4, Cytisus albus.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Sunshine.

The sudden flood of brilliant sunshine which has burst upon us as a contrast to the too frequent chilliness and dullness of the month of May, as if to mitigate the gloom inseparable from a great and unexpected calamity, may well lead us to consider the utterly inestimable boon which it involves. All too unthinkingly, as a rule, do we bask in its rays and revel in the brighter prospects of verdant foliage and resplendent bloom which it is bringing into being, without considering that in those genial beams of light we behold the veritable hand of the Creator, the one vivifying and stimulating influence by virtue of which we and all organic life outside us live and move and have our being. The sunbeam, properly considered, is the most wonderful of all familiar things, one of the most complex, and one of the most subtle. If we analyse it, break it up into its components by means of the spectrum, a mere prism of cut glass, we find it composed of an infinite number of light waves, which, impelled from the sun, ninety-seven millions of miles away, have undulated across that inconceivable distance in about nine minutes, or less, to exercise their beneficent influence on our planet. These waves, moreover, are not all alike; they vary greatly in length and in nature, and by simply passing a beam through the prism aforesaid, this difference becomes manifested by a sorting out, so that the shorter waves appear at one end of a line and the longer at the other, with a regular gradation in between. By this sorting it is found that each wave length produces its special colour within a certain area, within which appear all the tints of the rainbow, itself an enlarged section of the line we see. Outside that area of light, however, other invisible waves exist which convey the heat, as may be proved by focussing such rays through a lens on any combustible object. This, however, is by no means all; that beam of broken-up sunshine is practically a chart of all the elementary substances existent in the sun, and contributing to its incandescence. The line of colours is traversed perpendicularly by an immense number of thin dark gaps, and every one of these gaps or dark lines has been found to occupy a certain definite place in relation to a certain definite element, so that it has been possible to make a chart infallibly denoting all the elements in the solar complex. This has been proved by the fact that on our earth (originally a part of the sun, and therefore of similar composition, though by virtue of its cooling under different conditions) these same elements exist, and when rendered incandescent, their particular spectrum shows the particular sets of lines proper to them, and occupying the same places as shown by the solar charts. Undoubtedly, in addition to all this, there are potent electrical waves in combination with the heat and light ones, but whether these are separate or, as is more probable, intrinsically identical, is not yet made clear. In any case, the marvellous result is the same—viz., that when these beneficent rays reach the earth's surface their potency, unenfeebled by the enormous journey through the inconceivable cold of space, becomes immediately manifest as genial warmth and vivifying energy. How it is that the great world of vegetation comes in as the one and only medium for the transference of this solar energy to the organic world generally. The beam, falling on the nascent leaf, impels its component cells to absorb the carbonic acid from the surrounding atmosphere, and by inducing transpiration, draws up from the root system fresh supplies of sap. Under its impulse, and by virtue of the material thus supplied, the cells multiply and fulfil their manifold duties of decomposition and re-composition, and thus, bit by bit, build up all the wonderful vegetable products upon which the animal world is dependent for its existence, directly or indirectly; while man himself becomes its debtor, not merely for his food, like the rest of the animal creation, but for the great mass of his luxuries, the production of which from the raw material affords the means of subsistence for myriads of men and, in conjunction with the merely agricultural industries, constitutes the very backbone of human prosperity. Considering all this, the thoughtful mind cannot but sympathise with the old cult of the Sun-worshippers, who even in those far distant days appreciated much of what we have said above; though in these more enlightened times we perceive that even the mighty sun itself is but a dot in the universe, and that the beneficent influence it imparts is but a manifestation of an infinitely greater beneficent, omniscient, and omnipotent Creative Power, which is utterly beyond human comprehension. Therefore, while we enjoy the sunshine and all the blessings it brings, we may well pause to consider what it is, whence it comes, and how it reaches us.

MR. BENJAMIN CROMWELL.

Mr. Benjamin Cromwell, whose portrait it gives us great pleasure to present in the present issue, is well known to our readers by reason of his prowess as a cultivator and exhibitor of stove and greenhouse plants over a long number of years. Mr. Cromwell has also on several occasions contributed calendarial notes to the GARDENERS' MAGAZINE. He is head gardener to Thomas Sutton Timmis, Esq., at Cleveley, Allerton, Liverpool, and has been at these gardens for twenty-seven years. He is fortunate in having an employer who has a very deep love for his garden, and for all that is beautiful in Nature, and who also sees to it that his gardener has sufficient staff and material to maintain the gardens in a very high state of cultivation Mr. Cromwell does the rest, with the result that the Cleveley gardens are probably the finest among the many fine gardens in the Liverpool district. As a cultivator of specimen stove and greenhouse plants Mr. Cromwell has few equals, and no superiors among private gardeners, and his skill in this direction has been demonstrated over a long series of years at the leading flower shows of the Liverpool district, but more especially at the great Shrewsbury Fête held each August; both for twenty specimens and for thirty specimens Mr. Cromwell has again and again won the premier honours, and he frequently scores for fewer and larger specimens in the open competitions, where he has to meet the great trade growers. But other things are not neglected at Cleveley, and, as we have had opportunities of discovering, the various departments of the garden give evidence of the same high order of skilful management as do the plant houses. Mr. Cromwell is no longer young, but he has abundant energy, and his many friends are glad to know that his health is much better than it was a year or two ago.

Floricultural Encouragement at Newcastle.—We are delighted to learn that the North British Academy of Arts (Newcastle-on-Tyne) last month formulated a scheme for beautifying the homes of the poor by encouraging the children in pot plant and window box gardening, prizes being awarded for the best. An influential committee was formed, and so successful have been their efforts that on Tyneside alone more than 2,500 children have entered, and been provided with the necessary seeds by the academy. The sum of fifty guineas has been allocated for prizes, in the hope that not only will the homes be beautified, but a love of Nature inculcated which will have lasting effects in the minds of the children.

Essex Farmers' Visit to Ireland.—The Essex Education Committee have arranged for a twelve days' visit of agriculturists and horticulturists to Ireland in July. The programme is a comprehensive one, and will afford the party opportunities of seeing the organisation and practice of agriculture and horticulture on farms and holdings varying in size from four or five up to three hundred and fifty acres. The sparsely populated districts of the West, the potato growing soils of the South, and some of the more intensely cultivated areas of the North will be visited. One day is devoted to the Loughgall fruit district of 3,000 acres, another to the commercial estate of Sir Josslyn Gore-Booth, Bart., near Sligo, and another to the estate of Colonel Nugent T. Everard, J.P., D.L., at Navan. Co-operative creameries, bacon factories, and a poultry fattening station will be inspected, while among the extraordinary industries to be visited are tobacco and hemp culture, bulb farming, cider making, fruit and vegetable drying, and a school of needlework. Ireland has been such a good customer for pedigree cattle during the past ten years that it is needless to add that some very fine pure-bred stock will be met with during the journey. The schemes of instruction and agricultural institutions of the Department of Agriculture, the work of the Congested Districts Board and the Irish Agricultural Organisation Society figure in the itinerary, while the lighter side is catered for by a week-end at Killarney and a drive down the Vale of Avoca. Mr. B. W. Bull, N.D.A., County Laboratories, Chelmsford, will gladly forward particulars of this outing. The dates are July 14 to July 26, and the party is limited to forty persons.

Finsbury Square Garden.—One of the best-known of London's squares is Finsbury Square, and we understand the London County Council is anxious to take over the garden in the square, and make it a public open space. The owners and occupiers of houses round the square evidently prefer matters to remain as they are, though in so doing there is, apparently, some risk of the Ecclesiastical Commissioners presently building upon the garden. At a meeting held a few days ago at the City of London College the following resolution was defeated by a substantial majority: "That at this meeting the owners and occupiers of the houses round Finsbury Square Garden hereby resolve that, pursuant to the Open Spaces Act, 1906, the owners of the Finsbury Square Garden may convey to the London County Council their estate or interest in Finsbury Square Garden in trust for the enjoyment of the public."

The Selborne Society, of which the late Lord Tennyson was, and Lord Avebury now is, president, has recently been developing its work and increasing its activities. During last year it acquired new offices at 42, Bloomsbury Square, in order to form a home for its library and to provide reading and committee rooms. The objects of the society are to promote the study of natural history; to preserve from needless destruction such wild animals and plants as are harmless, beautiful, or rare; to discourage the wearing and use for ornament of:—(1) the skins and furs of such animals as are in danger of being exterminated, and (2) the skins and plumage of such birds as are not domesticated; to protect places and objects of natural beauty or antiquarian interest from ill-treatment or destruction; and to afford facilities for combined effort in promoting any of the above or kindred objects.

The Gardens in the Dukeries. Among the celebrated gardens of England none are more famous than the group of princely establishments that occupy a very large tract of country around Worksop, and are known collectively as The Dukeries. It has been the aim of almost every young gardener who aspires to a high position in his profession to spend at least a couple of years at one or other of these extensive and well-kept gardens, just as it is the desire of every real garden lover to inspect the fine plant collections and spacious pleasure grounds at Welbeck Abbey, Rufford Abbey, Clumber, and Thoresby Park. However, it is not given to everyone to work in or inspect these beautiful gardens, therefore the next two issues of the "Gardeners' Magazine" should prove particularly interesting and attractive to our readers, because they will contain a freely illustrated and descriptive account of those mentioned. An unusually large sale of these issues (June 11 and June 18) is already assured, consequently all who need extra copies should place their order at once to prevent disappointment.

Epping Forest.—The continued interest taken in Epping Forest is shown by questions asked at a recent Court of Common Council, held at the Guildhall, under the presidency of the Lord Mayor of London. The chairman of the Epping Forest Committee was asked to bring before his committee: — That part of the forest lying between Bury Road and Fairmead, with a view to the advisability of thinning the same, the judicious policy of the committee in existence for the last two years being much appreciated by the public of the district. In reply the Chairman said he was very glad to know that the policy of the Epping Forest Committee, so far as thinning was concerned, met with so much approval from the public living in the district, and he would have much pleasure in bringing the matter to the attention of the committee.

York Gala.—We may remind our readers that the Grand Yorkshire Gala will be held at York on June 15, 16, and 17. There will be special features on this occasion and prizes to the value of £800 will be offered for competition.

Edible and Poisonous Fungi.—With a view to enable residents in the country to distinguish accurately between the poisonous and edible kinds of native fungi, and thus to utilise to a greater extent those kinds useful for food, the Board of Agriculture has published a book containing descriptions and coloured illustrations of seventeen edible and eight poisonous species, all more or less common in Great Britain. The original drawings were prepared by Mr. George Massee, V.M.H., assistant keeper of the Herbarium at Kew, a famous mycologist, who has been greatly assisted by his daughter, Miss Ivy Massee. The book is published by the Board at one shilling, and it should become a popular work of reference. It is stated that, contrary to popular belief, the poisonous kinds of fungi are comparatively few in number, while there are about fifty species which may safely be eaten. In order to recognise with certainty these different kinds it is necessary, however, to know the special features possessed by each species which separate it from all others. The old rule of thumb signs for discriminating between edible and poisonous fungi are absolutely valueless, and no reliance should be placed on the presence of a skin that is readily peeled off as an indication of an edible fungus, or on the statements that a silver spoon placed in contact with poisonous kinds becomes tarnished, or that all fungi growing on wood are poisonous.

Horticulture at Dudley. Although the Dudley Corporation is doing its best to provide allotments for those who desire them, it would appear that horticulture in the district has fallen on evil times, inasmuch as lack of interest or support has led to the cessation of annual exhibitions in the neighbourhood. Both at Gornal and Tipton there used to be horticultural exhibitions each year, and one on a comparatively large scale was held at Dudley, but all these have come to naught. During the last two years the Corporation allotment holders have held an exhibition of their produce, so that there is the foundation for a society. All that is wanted is an energetic and enterprising person to take the matter in hand, and if he has "zeal according to knowledge," we have little doubt that an influential committee and the necessary financial support will be forthcoming. A Wolverhampton contemporary discussing the matter states: "There is more sport in a flower show than some people are aware of, and a community like Dudley without a flower show is simply a howling example of wasted opportunity."

London Playing Fields.—After twenty years of excellent work in the provision of playing fields for the youth of the metropolis, the London Playing Fields Society finds itself under very heavy responbilities, and is appealing for larger financial assistance. Altogether a sum of £33,000 is needed for the purpose of completing the purchase and improvements of the Elms [illegible] Fields at Walthamstow; Fairlop [illegible], Ilford; Prince Edward Playing Fields, Edgware; and Prince George's Playing Field, Raynes Park. The respective areas of these spaces is 34 acres, 30 acres, [illegible] acres, and 50 acres. Mr. F. R. Bush, The Warren, Coombe Lane, Wimbledon, will gladly acknowledge any assistance given, or give particulars concerning the work of the society.

Rhododendrons at Regent's Park.—The annual display of rhododendrons formed by Messrs. J. Waterer and Sons, Lim., of Bagshot, in the gardens of the Royal Botanic Society, Regent's Park, is invariably one of the most beautiful features of the London season. This year it promises to be well up to the average in beauty and extent, and as the firm has many fine novelties the interest of the display will be increased. The exhibition opens on Monday, June 6, and will remain open throughout the month.

Warning to Window Gardeners.—We cull the following from an American contemporary: "A peculiar and unfortunate accident happened in front of the Belmont Hotel, New York, on the afternoon of April 8. John E. Mayhew, an advertising agent, had just left the Grand Central Station, and was passing the hotel when a flower pot fell from the tenth storey, struck him on the head, and broke his skull. He was taken to Bellevue Hospital in a dying condition. We trust that this accident will be a warning to all dwellers in cities. Many times we have noted great carelessness by householders concerning the way they have plants, both in pots and boxes, outside their windows. Doubtless the people who caused the accident are deeply grieved, but that does not improve the situation. Here are some instructive figures: Distance flower pot fell before striking Mr. Mayhew, 120 feet. Weight of flower pot, about 10 pounds. Its velocity when Mayhew was hit, 128.60 feet a second, or about 100 miles an hour. Force of the blow, about three tons—about the same force a projectile from a 6-inch gun has when it strikes an object."

Royal Oak Day at Chelsea.—Everyone knows that "The twenty-ninth of May is Oak-apple Day," but not many know that each year, at the Royal Hospital, Chelsea, there is an Oak Day celebration to commemorate the fact that Charles II. founded this fine institution. The celebration took place on Saturday, May 28, when all the able-bodied men among the 550 pensioners paraded round the statue of King Charles II. The statue was decorated with oak leaves and sprays, but the pensioners did not wear oak leaves, as on former occasions.

French Garden at Warley Park, Birmingham.—We are informed that the French Garden exhibited by Messrs. Sutton and Sons, in Warley Park, Birmingham, during Whitsun week, was inspected by no fewer than 140,000 visitors.

American Lady Gardeners.—It appears that some of the American ladies occupying high positions in Society are disgusted with the high prices of flowers. The Californian ladies object to pay one and a half dollars for an orchid bloom and two or five dollars a dozen for roses produced in that land of sunshine, and to shew their [illegible] seventy of them have joined together, and articles have been signed for the incorporation of the California Ladies' Plant and Flower Company, with a capital of 100,000 dollars. These ladies are going to reintroduce the old favourite La France and other roses, and make things hum generally in the flower trade of the Golden West.

YELLOW FOXGLOVES.

Everyone admires the foxglove, with its handsome spikes of flowers, and there are few finer sights than masses of their tall stems laden with bloom. The range of colour among foxgloves is now very great, but it is to the perennials, and not to the biennials, such as Digitalis purpurea, that we have to look for foxgloves with yellow blooms. They have, besides the difference in colour, the gain of a true perennial character, and, could we import into their drooping blossoms a little more brightness of hue, we would ensure for these perennial digitalises a high degree of popular favour.

Digitalis ambigua, the Swiss yellow foxglove, is a good perennial, sending up its spikes of rather dull yellow flowers to a height of about three feet, and, despite its want of brightness, proving itself a highly useful plant in the border, on the rockery, or in the wild garden. It is thoroughly hardy, and will grow in any common soil, and either in sun or in shade. Seeds are obtainable, and a few seeds can be purchased for a small sum.

It is doubtful whether one ought to include the Rusty Foxglove (Digitalis feruginea), in these notes, seeing that the pale yellow ground colour of the blooms is obscured by the purple veinings which run through the flower. It is more singular than pretty, yet there are not wanting people who confess to some preference for it, which is a true perennial also. It is both curious and distinct, and these are points which some seek for, and will find in Digitalis ferruginea.

Digitalis grandiflora is a fine foxglove, having large and pretty flowers, although the shade of yellow is not a bright one. The blooms are differently shaped when compared with those of D. purpurea, but are in all points pleasing and acceptable. It is of dwarfer habit than the preceding species, for, while D. ambigua grows about three feet, and D. ferruginea about four feet, D. grandiflora only reaches about two feet high. It, also, is easily raised from seeds, and a little clump or group is sure to draw the notice and admiration of the garden lover.

Such flowers as these are so easily grown that the word cultivation seems superfluous. Yet, although they will thrive anywhere almost, they have their places, and among these are positions in shade, as well as in sun. They will, for example, be found good for growing under deciduous trees, and they can be planted to advantage in open woods. On the large rockery they look well, and in the border good clumps will give pleasure. They can be increased by division in spring or autumn, when the plants are large enough, but, undoubtedly, they are best raised from seeds sown in spring in drills of sandy soil, about a quarter of an inch deep, and covered with similar soil. They should be thinly sown, and afterwards thinned out to about two inches apart, those removed being transplanted to a little bed to remain until strong enough for their flowering quarters, into which they can be put in autumn or spring.

Distinct, curious in their colouring, and pretty as well, these yellow foxgloves will appeal to many.

S. Arnott.

STRAWBERRY CULTIVATION FOR MARKET.

The following comprehensive and excellent treatise on the cultivation of strawberries has been issued in the form of a leaflet by the Board of Agriculture. The cultivation of strawberries has of late years greatly extended, and strawberry growing has become an important industry in certain localities. The area in Great Britain returned as under strawberries alone, or with only a very small admixture of other fruits, on holdings exceeding one acre was 28,815 acres in 1908. Of this total 24,601 acres were in England, the leading counties being Kent, Cambridge, Hampshire, Norfolk, and Worcester.

The industry is a very suitable one for small holders, although considerable initial capital is required. It has been found in Hampshire, where strawberry growing is extensively carried on, that a man can often make a moderate living from two acres of land under strawberries, while in many instances a family may be said to be comfortably provided for on a holding of four acres.

Gross returns may be said to lie between £40 and £60 per acre, but may fall as low as £20, while in a favourable season they may rise to as much as £100. Strawberry growing, however, is attended by considerable risks, and the beginner who is only possessed of a limited capital will find that late frosts towards the end of April or in early May may spell disaster to his crop, and involve the loss of the greater portion of his capital.

Soil,

Good heavy land, especially if such land has a warm aspect, makes an almost ideal strawberry soil. Heavy land holds moisture well, and does not require so much manuring as land that quickly "dries out." Soil just too heavy for potatoes also makes good strawberry land. Different varieties of strawberries, however, require somewhat different soils; for example, a heavy soil is more suitable for the Paxton than for either Royal Sovereign or the Laxton, as both these varieties produce an excessive amount of foliage in the second and third seasons when grown in a retentive loamy soil, especially if manure has been liberally employed. Though on the whole heavy soils are preferable to light soils, stiff clay cannot be recommended.

Where other conditions are favourable, but the land at first sight seems unsuitable, it would be desirable to test its strawberry-growing capacity by planting a small area as an experiment, for experience has shown that land not possessing any apparent qualifications may in some cases by suitable cultivation be made to yield heavy crops. Many of the strawberry plantations of Hampshire are examples of this, as they have been formed on heath land which was considered unsuitable for ordinary farming.

In forming a new plantation the ground should be thoroughly cultivated to a depth of 12 or 15 inches, by ploughing and sub-soiling, or by digging and trenching.

Manuring.

Owing to the extent to which strawberries exhaust the land, and to the risk of damaging the bed by subsequent manuring, the soil must be well manured at the outset. As much as 20 to 30 tons of good short dung may be applied per acre when the bed is formed, and 10 tons in the autumn after the second crop is taken. Bone manure may be substituted for the latter dressing, but artificial manures are not in general use.

The cost of farmyard or town manure may be put at about 6s. 6d. per ton, and in addition 2s. per ton for haulage to the ground, and from 2s. to 3s. per acre for spreading, must be allowed, so that the average cost of manuring will work out to something like £9 to £12 per acre.

Planting.

Strawberries may be planted either in the autumn or the spring. If planted in a good soil in September or October a small crop of quite good fruit may be gathered the following year. The importance of this lies in the fact that a small return is obtained a year earlier than if the planting were done in the spring. Many growers, however, consider that September is too early for planting owing to the runners not usually being sufficiently established, and also regard it as undesirable to take a crop the first year. October is probably the most usual time for planting, or else February or March. In planting it is important that the crowns be kept well below the surface of the ground, without being buried. If elevated above the surface the new roots which are continually forming near the surface will suffer for lack of moisture. The plants will throw out runners in May or June. These may be allowed to remain if the plants are strong ones, but if the plants are weak and backward, some growers consider that the runners should be removed at once, each plant being allowed to concentrate its energies on the development of the first truss of flowers. On the other hand, backward plants may thrive later in the season and it is doubtful if the advantages gained by removing runners will pay for the extra labour involved.

The cost of runners varies according to variety and quality, specially layered plants costing from 10s. to 15s. per 1,000, while "runabouts" (ordinary runners) may be bought for 5s. per 1,000. Assuming that there is less waste entailed in the purchase of stocky runners, and that weaklings are often planted in pairs, the average cost of plants per acre is from £4 to £8, 12,500 to 16,000 plants being required for each acre of ground. If planted 2 feet apart each way, nearly 11,000 plants are required per acre, but the distances between the rows and between the plants in the rows may vary considerably; for instance, rows 30 inches apart, and 12 to 15 inches from plant to plant, are common, while on the other hand, "Paxtons" and "Nobles" are planted 2 feet from row to row, and 1 foot from plant to plant, in which case nearly 22,000 plants per acre are required.

Varieties.—Particulars of some useful varieties of strawberries are given below:

Bedford Champion.—A large, handsome, richly coloured mid-season fruit. In much favour with growers, as the flesh is firm, and the fruit bears packing and travelling well.

Givon's Late Prolific.—A valuable dark crimson skinned variety for the last crop. A vigorous and free cropper.

Royal Sovereign.—A large and early variety, of good flavour; excellent for market and forcing.

Sir Joseph Paxton.—A large and prolific mid-season variety, having a good flavour and standing packing well.

Noble.—A large early variety, selling well until others are ready, but soft and bearing packing badly.

The Laxton.—A large, handsome, oval fruit, having a good flavour, but not packing so well as some varieties.

After Cultivation.

Pending the arrival of harvest time, a good deal of labour is involved. Where land is infested with weed seeds, and therefore liable to become foul very quickly, three hoeings are often necessary before the crop comes into profitable bearing, and each hoeing may cost as much as £3 per acre, so that the cost of cultivation, including the removal of runners, from the time of planting to the period when the fruit is fit for gathering—on an average about twenty months—will amount approximately to from £9 to £12 per acre. In some cases the charge for this work may be £15 or even £20 per acre. On a small holding most of this work would be done by the occupier.

Another item of expense is the cost of bedding with straw for the fruit to rest upon. There is no objection to bedding with manure made with straw, provided it be placed on the ground in early spring in order to allow the rains to wash the soluble constituents into the soil, leaving the sweetened or otherwise bleached portions of the straw for the fruit to rest upon. A large number of growers, however, now use clean barley or oat straw at the rate of from 15 cwt. to 1 ton per acre, the cost of the straw being from 35s. to 40s. per ton, with the additional expense of 8s. to 10s. per acre for laying or bedding it between the plants. A large quantity of medium quality straw is now steam baled and sold for bedding strawberries.

A further annual charge is the cost entailed in cleaning the plantations of weeds, clearing up straw, and trimming plants after the fruiting season is over. The cost of these operations may be put at from 10s. to 15s. per acre.

Life of the Beds.—A strawberry plant is usually at its best in its second year. A crop planted in the autumn of 1910 or the spring of 1911 would thus be at its best as regards quality in 1913. In 1914 the yield would be larger, but the quality would have somewhat depreciated, and it would probably be advisable that the beds should be cleared after this crop has been gathered.

The life of a plantation, however, is largely dependent upon the character of the soil and the amount of manure it has received. On heavy soils plantations are sometimes maintained for a period of five years, although this practice is much less common than formerly, whereas on lighter land three years is the usual limit. No advantage is gained by prolonging the life of a plantation beyond the fourth year, and the more successful cultivators now favour young plantations. Old beds are often kept for growing strawberries for jam-making.

(To be continued.)

BUSH PEACH TREES.

I was much interested in Mr. T. Coomber's reference (page 370) to my notes on this subject. I may add that peaches, nectarines, and apricots were all treated in a similar way in two long houses; one being 80ft. long, and the other 130ft. The former was well heated, the latter a cool house. The peaches predominated; the apricots were all grown together at one end of the long house, bushes in the front border and trained trees on the back wall. The apricot fruits from the bush trees were more juicy and richer in flavour than those from the wall trees; and I may here say that the fruits from trees on outside walls were still more juicy and of better quality. The peaches from the bush trees under glass were quite as well flavoured as those grown on the wall trees, the flesh being rather firmer. With regard to the all-round quality, especially in colour and size, if I say that thirty-six per cent. on the wall trees were fit for exhibition, then twenty-five on the bushes would be about the percentage.

The treatment of the young shoots on the bushes will, I am sure, not have the approval of gardeners generally; at least, I do not think it will; but the object was to prevent the bushes outgrowing their available space. Probably three or four fruits would form on a branch of the previous year's growth, and also a number of young shoots. Both fruits and shoots were reduced in numbers until one fruit, and one basal shoot only, were left on the branch; so that the peach appeared to be growing on a leafless branch, or stick. No young shoots were left on the branch beyond the fruit, and the same treatment was meted out to branches which were not allowed to bear fruits on account of over-cropping, all being taken off except a basal shoot. This was quite different treatment to that given to the wall trees. In the autumn all the leafless branches were cut back to the young shoots, and the latter took the places of the fruit-bearing branches, and, in their turn, bore fruit the following year.

This treatment never failed to yield a full crop of fruit, and at the end of ten years the bushes do not appear much larger than when they were first established. The shoots made are comparatively short, but are very strong, and quite bristle with fruit buds when the leaves have fallen. G. B.

TREES IN PLACE AND OUT OF PLACE.

Among many good people who use more sentiment than reason, or who lack knowledge of the facts, it has become a fad to say it is a crime to cut down a tree and that it is always, and under any circumstances, an act of greatest virtue to plant one.

To one who gives thought to the matter, these accepted axioms may be reversed; and we can say with all seriousness and all truth, that there is no town in this country where the judicious use of the axe among the trees in some part of it or another, is not demanded; and, on the other hand, thousands of trees are being planted where no tree should ever be placed.

Each variety of fruit or ornamental tree, when it reaches maturity under reasonably favourable conditions, has its established size or spread of branches. Among the better shade trees commonly planted, this reaches 40 to 50, and even a greater number of feet in diameter. In dense forests we see the trees stretching up and up, after the precious sunshine and air, losing their side branches and becoming a collection of giant telegraph poles with pitiful little bunches of green at the top; nothing beautiful about them, and all smaller and weaker specimens killed out or crippled.

Every tree, to be beautiful, must have room to expand and develop to its proper proportions, and to retain the side branches with which nature always furnishes them under such conditions, unless thwarted by the bungling hand of the hired man with the axe or saw.

Street trees should never be planted to be ultimately nearer than forty feet apart. Most of the better shade trees are slow in growth. It is quite advisable to plant quicker growing trees in between them for immediate effect, to be cut out later when they begin to crowd and injure each other.

Quite often when this time comes, the poorer, quick-growing tree is so much larger and finer looking a specimen, that the owner's heart fails him, and he compromises by hacking off the branches of all, ruining the whole row and, at that, only affording temporary relief, as it must be done again and again. In a few years the poorer and short-lived trees begin to die, and soon only a straggly row of melancholy cripples exists, where might have been noble specimens, good for generations to come.

Trees should never be planted so as to densely shade a building where humans or animals abide. The sun must reach every part of our dwellings for at least a part of the day, or the doctor will be a certain and frequent visitor.

Trees must not be planted in the centre of the lawn, says "Gardening" (America). At the side or the rear is the place for them if they will there have room to develop. A spreading apple tree or two in the backyard is good for shade and for its fruit if it is sprayed to kill the insects and fungous diseases.

If the house is densely shaded, use the axe ruthlessly and open the place up to admit air and light. If two trees are crowding each other, select the best, or best located, and put the axe to the other, unless it is small enough to move.

Don't trim up—cut down. One perfect tree is of more value than a yard full of crippled or stunted specimens.

Royal Botanic Society.—At a meeting held on Saturday last in the Society's gardens, Regent's Park, 78 new Fellows were elected, and 89 candidates were nominated for election at the next meeting. This brings the total of new Fellows for the year up to 400. Those present heard with great pleasure that since the previous meeting £800 worth of debentures had been surrendered to the society.

POTTING COMPOSTS.

A potting compost, as the term implies, is usually composed of two or more constituents, and the successful grower of pot plants has a formula something like a cooking recipe for every kind of plant. As a thrifty housewife has her stores of things always ready to hand for making the various dishes for the family, so a capable gardener has his stores in some out-of-the-way part of the garden from which he can make up composts for all the kinds of plants he expects to grow.

Constituents of Compost.

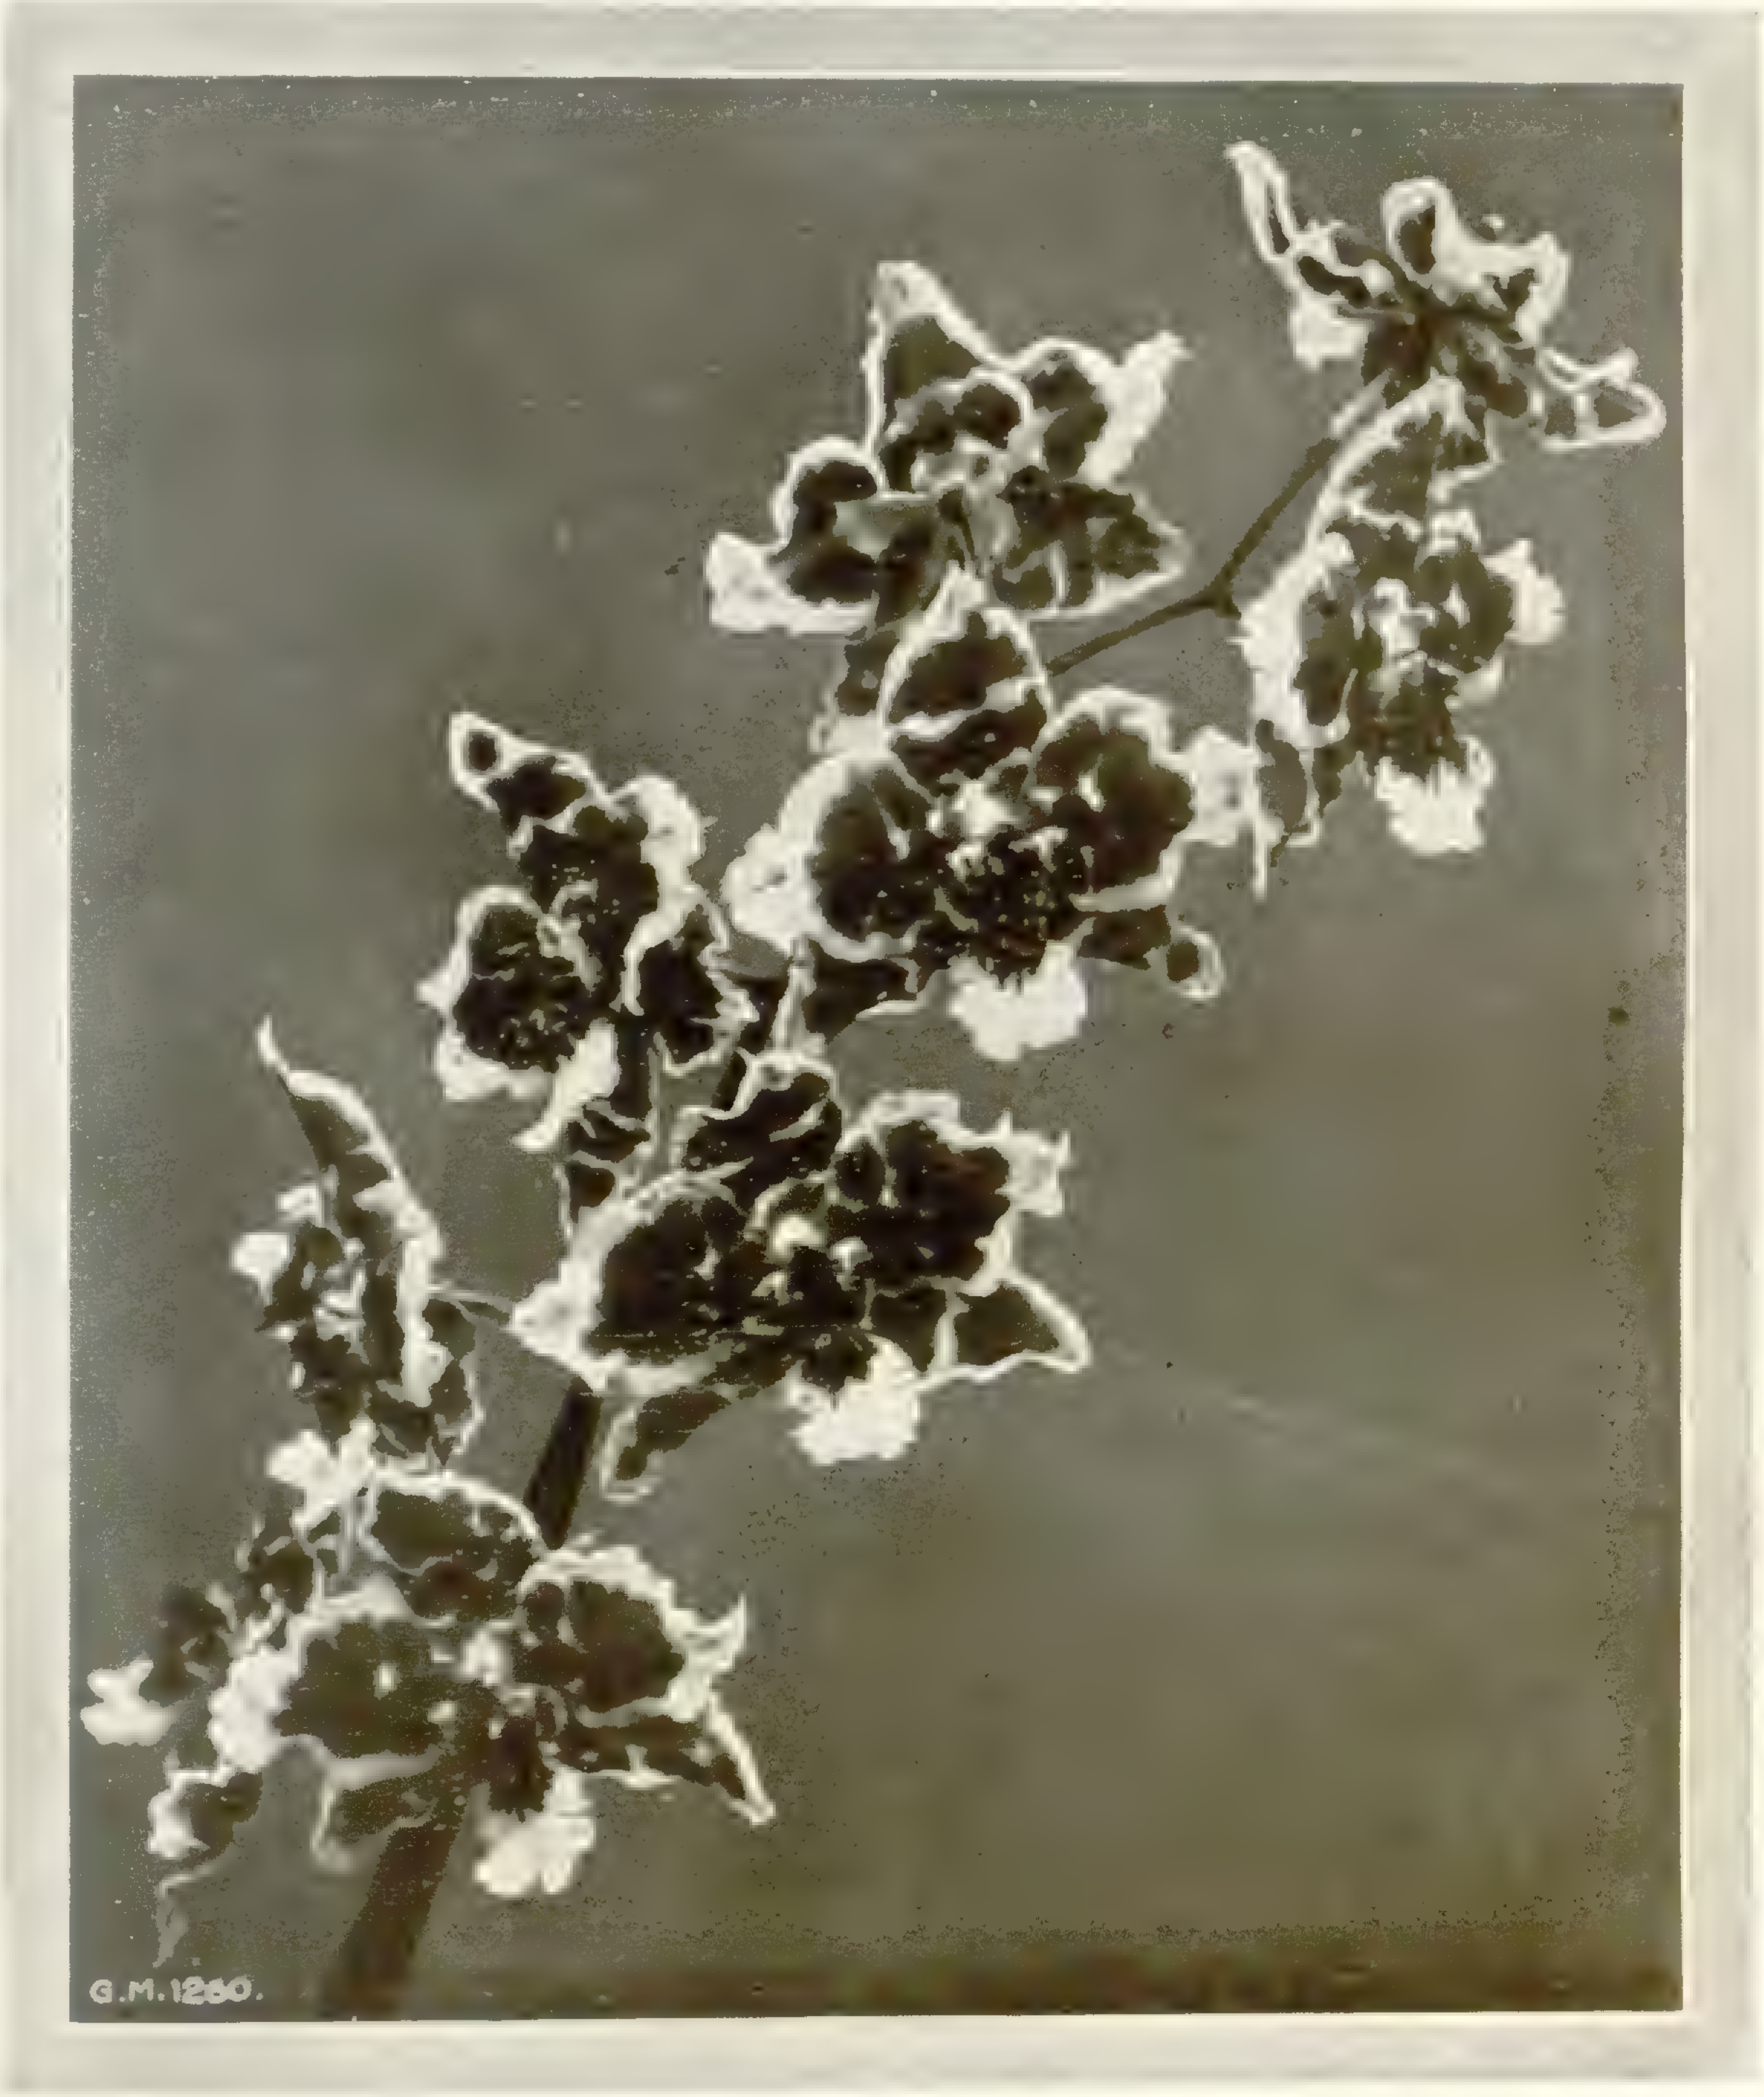
We must, then, first deal with the constituents of some of the principal potting composts, or those likely to be most generally in demand. The first to be mentioned, as it is the basis of most composts, is turfy loam. It is best obtained from a clay soil as the fibrous roots of the grass and the other constituents mixed with it will sufficiently lighten it, and we do not want the water to run through the pot like a sieve. It should be obtained from a rich meadow, and should consist of not more than the top three or four inches of turf—as bought it is often eight or nine inches, which is, of course, not so rich—this should be stacked up grass downwards in the form of a ridge, so that it may not get unduly washed by the rain, and left three or four months at least, and better six months, before it is put into use. Some put alternate layers of stable manure in the stack, and the result is very good when the whole becomes nicely mellow. When laying in a supply, it is well to estimate for two or three years, as loam improves by keeping and does not lose its fibrous character till after that time.

For those who grow plants of the heath family, which includes azaleas, a supply of peat is necessary, and this can be stored for a long time. Another necessary store, and one which will sometimes take the place of peat, is leaf-mould. Oak leaves are always recommended, but most people take the leaves of their own gardens whatever they may be, and these piled up and left for a year, and perhaps turned once or twice, will become excellent light material for potting composts, consisting as it will do, of a mixture of humus and the sand from the sweepings of the gravel paths. An old hotbed makes a very good reserve of rich material, which is always handy. Supplementary constituents, in order of importance, are sand, both silver and coarse, bone meal, basic slag, bone dust, and mortar rubbish.

Mixing the Constituents.

This demands some notice. Some recognised measure should be used, preferably one holding a peck, so that we may know the quantity of compost we have in view, and the amount of the various constituents. A pail is as convenient as anything for the purpose for an amateur, holding a comfortable amount to carry and well adapted for helping to scoop up the loam, leaf-mould, etc. It is advisable to have either a small pail holding about a peck or a large one holding half a bushel, as when mixing artificial manures with the compost a pound to the bushel of soil is a safe amount to use, while without any measure, either of soil or manure, one may easily use the latter at the rate of three or four pounds to the bushel without knowing it, and when one bears in mind that a pound to about forty square yards of surface is at the rate of a hundreweight to the acre, it will be seen what a number of tons to the acre three or four pounds to the bushel of soil will be. It is not necessary to weigh the manure every time, a little experience enabling one to tell what weight a given measure will hold, artificial manures, with the exception of basic slag, not varying very much in the weight of a small quantity. When making a compost, it is a good plan to sprinkle some of the manure over it as each pailful is emptied on the bench, as it ensures a more equal distribution through the mass.

An excellent compost for soft-wooded plants in general, one which might be called a universal compost, consists of two-thirds loam, the remaining one-third consisting of old hotbed material and leaf-mould in about equal proportions. When plants are given their final shift bone meal is a good lasting substance to mix with this compost at the rate of a pound to the bushel. It contains about half its weight of phosphate of lime, as well as some nitrogen.



TEMPLE SHOW—ODONTOGLOSSUM MEMORIA KING EDWARD VII.

F.C.C., R.H.S., May 24, Messrs. Sander and Sons, St. Albans. A striking variety, the sepals and petals being heavily blotched with deep purple on a white or blush ground.

Lime in Composts.

The soil in pots generally tends to become sour after a time, especially if watered with liquid manure, whether the latter is derived from animal manure or from artificial manures containing acid, as most of them do. Lime is a corrective of acidity, combining with acids and neutralising them, and it is well therefore to add it in some form to the compost except where it is to be used for plants which are lime-haters, as, for instance, most plants which like a peaty soil, such as the heaths, many lilies, azaleas, etc. Some plants, on the other hand, are specially lovers of lime, such as wallflowers, stocks, and antirrhinums, and nothing is better to mix with the soil in their case than old mortar rubbish.

The compost mentioned above as suitable for most soft-wooded plants is not so for that universally grown plant which we call the "geranium," as it is too rich, and induces more leaf than blossom. Turfy loam by itself is quite rich enough for them. If one has a heap of turfy loam and manure in alternate layers, as suggested above, that is by itself good enough for most plants without the addition of anything else than bone-meal, or lime in some form or other, according to the character of the plant. (Some samples of basic slag contain as much as 15 per cent. of free lime, besides phosphate of lime). For all young plants in the seedling stage such a mixture of loam and manure stacked together is quite rich enough, nothing needing to be added to it but some sand to keep it open.

Alger Petts.

Gloriosa superba.—Plants of this climber will now be covering a good portion of the roof of the stove, and in many instances will be flowering freely; they should therefore be given liberal doses of liquid manure, and the syringe must be used among the foliage, or thrips will be found troublesome.—Thomas Stevenson.

PLANTING LEEKS.

Few vegetables have come so quickly to the front in recent years as leeks. They make an exceedingly appetising dish, are also comparatively easy of culture, and enjoy the great advantage of remaining uninjured when other vegetable crops perish through frost. On this account a good supply of this highly nutritious vegetable can always be obtained in winter and early spring, when other vegetable supplies are at a premium.

Plants raised from seed in the earlier months of the year, either in the open ground or under glass, should be transplanted as soon as they are large enough to handle conveniently. A light, fairly rich soil, and open situation, is preferable for this crop, and as it is always advisable to provide a liberal quantity of manurial stimulant, this should have been incorporated in the ground during the previous autumn. Leeks are gross feeders, but they do not derive any benefit from fresh stable manure or undecomposed farmyard dung. The manure should always be thoroughly well decomposed. Perhaps the greatest essential in growing good leeks is to get a great length of well-blanched stem. For this purpose earthing up is necessary, as in celery cultivation, and the plants must therefore be put out in trenches, furrows, holes, etc., so that this work will be facilitated in the after-cultivation of the crop.

The young plants of the main crop varieties may generally be put out in June, while those of the later varieties are fit for transplanting in August. This work should be performed, whenever possible, when the ground is moist from a previous shower of rain, otherwise a good watering should be given and the trench or hole allowed to become just moist enough for the ground to be easily workable. Perhaps the most general method of planting is by means of V-shaped trenches. These should be at least six or eight inches deep, and about two feet apart, the plants being inserted at the bottom eight inches apart. This is a very satisfactory method of growing a useful main crop of leeks, and gives very little trouble in regard to earthing up. Plenty of moisture is essential, care being taken to provide this regularly, so that a uniform state of dampness is kept up. Shorten the leaves slightly before planting, and as the plants progress in growth keep the surface soil well stirred with the hoe, drawing the earth up gradually around the stems as the season advances. At first, this should only be done up to the level of the surrounding ground, but when the plants are nearing maturity the stems should be completely earthed in with a sharp ridge of soil.

Not only does this earthing up blanch the stems, thus giving them their very familiar and attractive appearance, but it also tends towards a greater length of stem, and prevents the plants from making too luxuriant a growth of useless foliage. Some advantage may be gained by supplying the plants with liquid manure when they are in full growth, but this should not be applied when the ground is dry, but preferably just after a shower of rain or after they have been well watered.

The method of growing leeks in shallow trenches is the one usually advocated where exhibition stems are required. Such trenches should be about twelve inches deep, and at least six inches of well-decayed manure should be put in the bottom of the trench. This manure must be well trodden or rammed down into the bottom layer of soil, and the seedling plants inserted about eighteen inches apart. It is necessary, however, to have this planting out completed in May, as the leek takes some thirty weeks to mature properly. Abundant supplies of water and liquid manure are, of course, essential for exhibition leeks, and to preserve them clean and unblemished it will be advisable to place sand or collars round the stem before commencing to earth up in the middle of July. Some growers adopt the plan of growing this vegetable in holes made with a large thick dibber. The plants are then placed upright in the centre of these holes, and eventually the soil will fall in, and so gradually earth up the plants without any trouble. It may be well, however, to prepare some specially fine soil and fill up the holes with it.

Leeks are usually ready for the table in September, and with good management a constant supply can be maintained throughout winter and spring, those of the later sowings being available until the end of April. Sowings may, of course, be made in the open ground, a practice which usually answers best in shallow soils or where the subsoil is damp.

As regards varieties, a selection can be made of the following, all of which are useful: Improved Musselburgh, Sutton's Prizetaker, Ayton Castle Giant, The Lyon (a well-known large exhibition variety), and London Broad-leaved Flag.

Old Basing. J. Newsham.

TEMPLE SHOW—ROSE EXCELSA.

A.M., R.H.S., May 24, Messrs. Paul and Son, Cheshunt. A rambling variety of the Wichuraiana type, somewhat like Crimson Rambler, but with larger and more double flowers, in more elegant clusters, and of a bright red colour.

Bougainvillea glabra.—Notwithstanding it is frequently grown as a stove plant, B. glabra, the species most generally cultivated, makes the most satisfactory growth and blooms most profusely when it has a place in the greenhouse or other structure in which an equivalent temperature is maintained. They may be successfully grown either in pots or beds, and should have the principal growth trained up the rafters with the laterals allowed to hang down in a natural manner. The beds and pots must be well drained, and the compost should consist of fibrous loam, leaf-mould, and sand. An abundant supply of water at the roots is necessary during the season of growth, but when the plants are at rest the soil must be kept rather dry. A short time previous to new growth commencing, the side shoots should be pruned to the second or third bud from the base. If the resulting growths are crowded remove a few, and allow those remaining to grow without check.—P. P.

ROSE GOSSIP.

At the time of writing (May 28) we have several roses in bloom, chiefly teas, in warm corners and on walls. Rêve d'Or, in a neighbour's garden, is quite showy, and promises, ere many days, to be in full bloom. One of the earliest in this district is Mdme. Falcot, while a plant of Charles Lawson is already fine. For many years this plant has been about the first to open, and I never knew it fail. The plant in question is on a friend's house, facing due east, but there is a fair screen of trees a little way off, while it is protected on the north side by an adjoining house. The Scotch briars are in flower. I often think we might well pay more attention to these. They form a pretty low hedge that is green all the season, and much freer from all enemies of the rose than other sections. If they do only bloom once, they are the earliest, and very showy without any suspicion of gaudiness. Then they are no trouble except for a tendency to ramble somewhat by means of their sucker-like growths. The first blooms of roses always attract; and even if not of high quality they are quite as pleasing as when we get such a quantity that choice is difficult.

Some Rosa rugosas are out, and the bushes of these will very soon be full of bloom. Weather does not seem to affect their foliage, and it is singularly free from maggot, which, I am sorry to see so much of already. Then we have a few blooms open of sinica Anemone, and a more delightful single rose, with its glossy green foliage, it would be hard to select.

Much work is springing upon us now. Not alone is there the constant hand-picking of maggot and grub, but in sheltered positions we are inundated with green-fly, and prompt measures must be adopted. For several days now we have had cold north-east winds here—if I except the two or three days of thundery and sultry weather of "comet-time." During the prevalence of cold, and especially easterly winds, I fancy the fly is more troublesome than usual, and seems to increase very rapidly in a sheltered corner. It may be more noticeable because it is in such positions that our forwardest growth is to be found.

Standard roses, more particularly maiden plants, need much care now. There are numerous suckers to remove, both from the stems and around the bud, and the sooner these can be cut away, not only is it better but the work itself is done easier, and in so much less time, while we are conserving the whole of the plant's energies in the desired direction. As the first break from the rose bud advances we think it wise to pinch out the tip, unless there are two or three breaks from the same bud, which not infrequently happens. By heading the maiden growth one secures a stouter wood, and one that will not be so likely to break out later on. It also has a tendency to help the growing bud to unite with the stock more firmly. Such plans should not be adopted where roses are worked upon the standard briar solely with the object of securing a few good flowers for exhibition. For instance, we used to work Louis van Houtte, Duchess of Bedford, A. K. Williams, Monsieur Noman (seldom seen now), and others for the sake of getting a better maiden bloom for exhibition, and in that case they were allowed to throw up the first break without being headed.

I think we might pay more attention to the selection of young growths in the centre of dwarfs and the heads of standards. It is little trouble now, and not only benefits the remaining growth by admitting more air and light, but the bulk of the resulting shoots if allowed to mature would need removal when pruning next spring.

How very widely roses vary in growth in different districts. Liberty, with me, is far from being a satisfactory grower, try it how I may. A few miles off, and apparently in similar soil, a friend of mine grows it as strongly as I can the old favourite General Jacqueminot, and very grand have some of his flowers been. Madame Jules Grolez is another similar case. This beautiful rose does fairly well with me, but with my friend it is a large bush. On the other hand, our Le Progress is three times as strong as his.

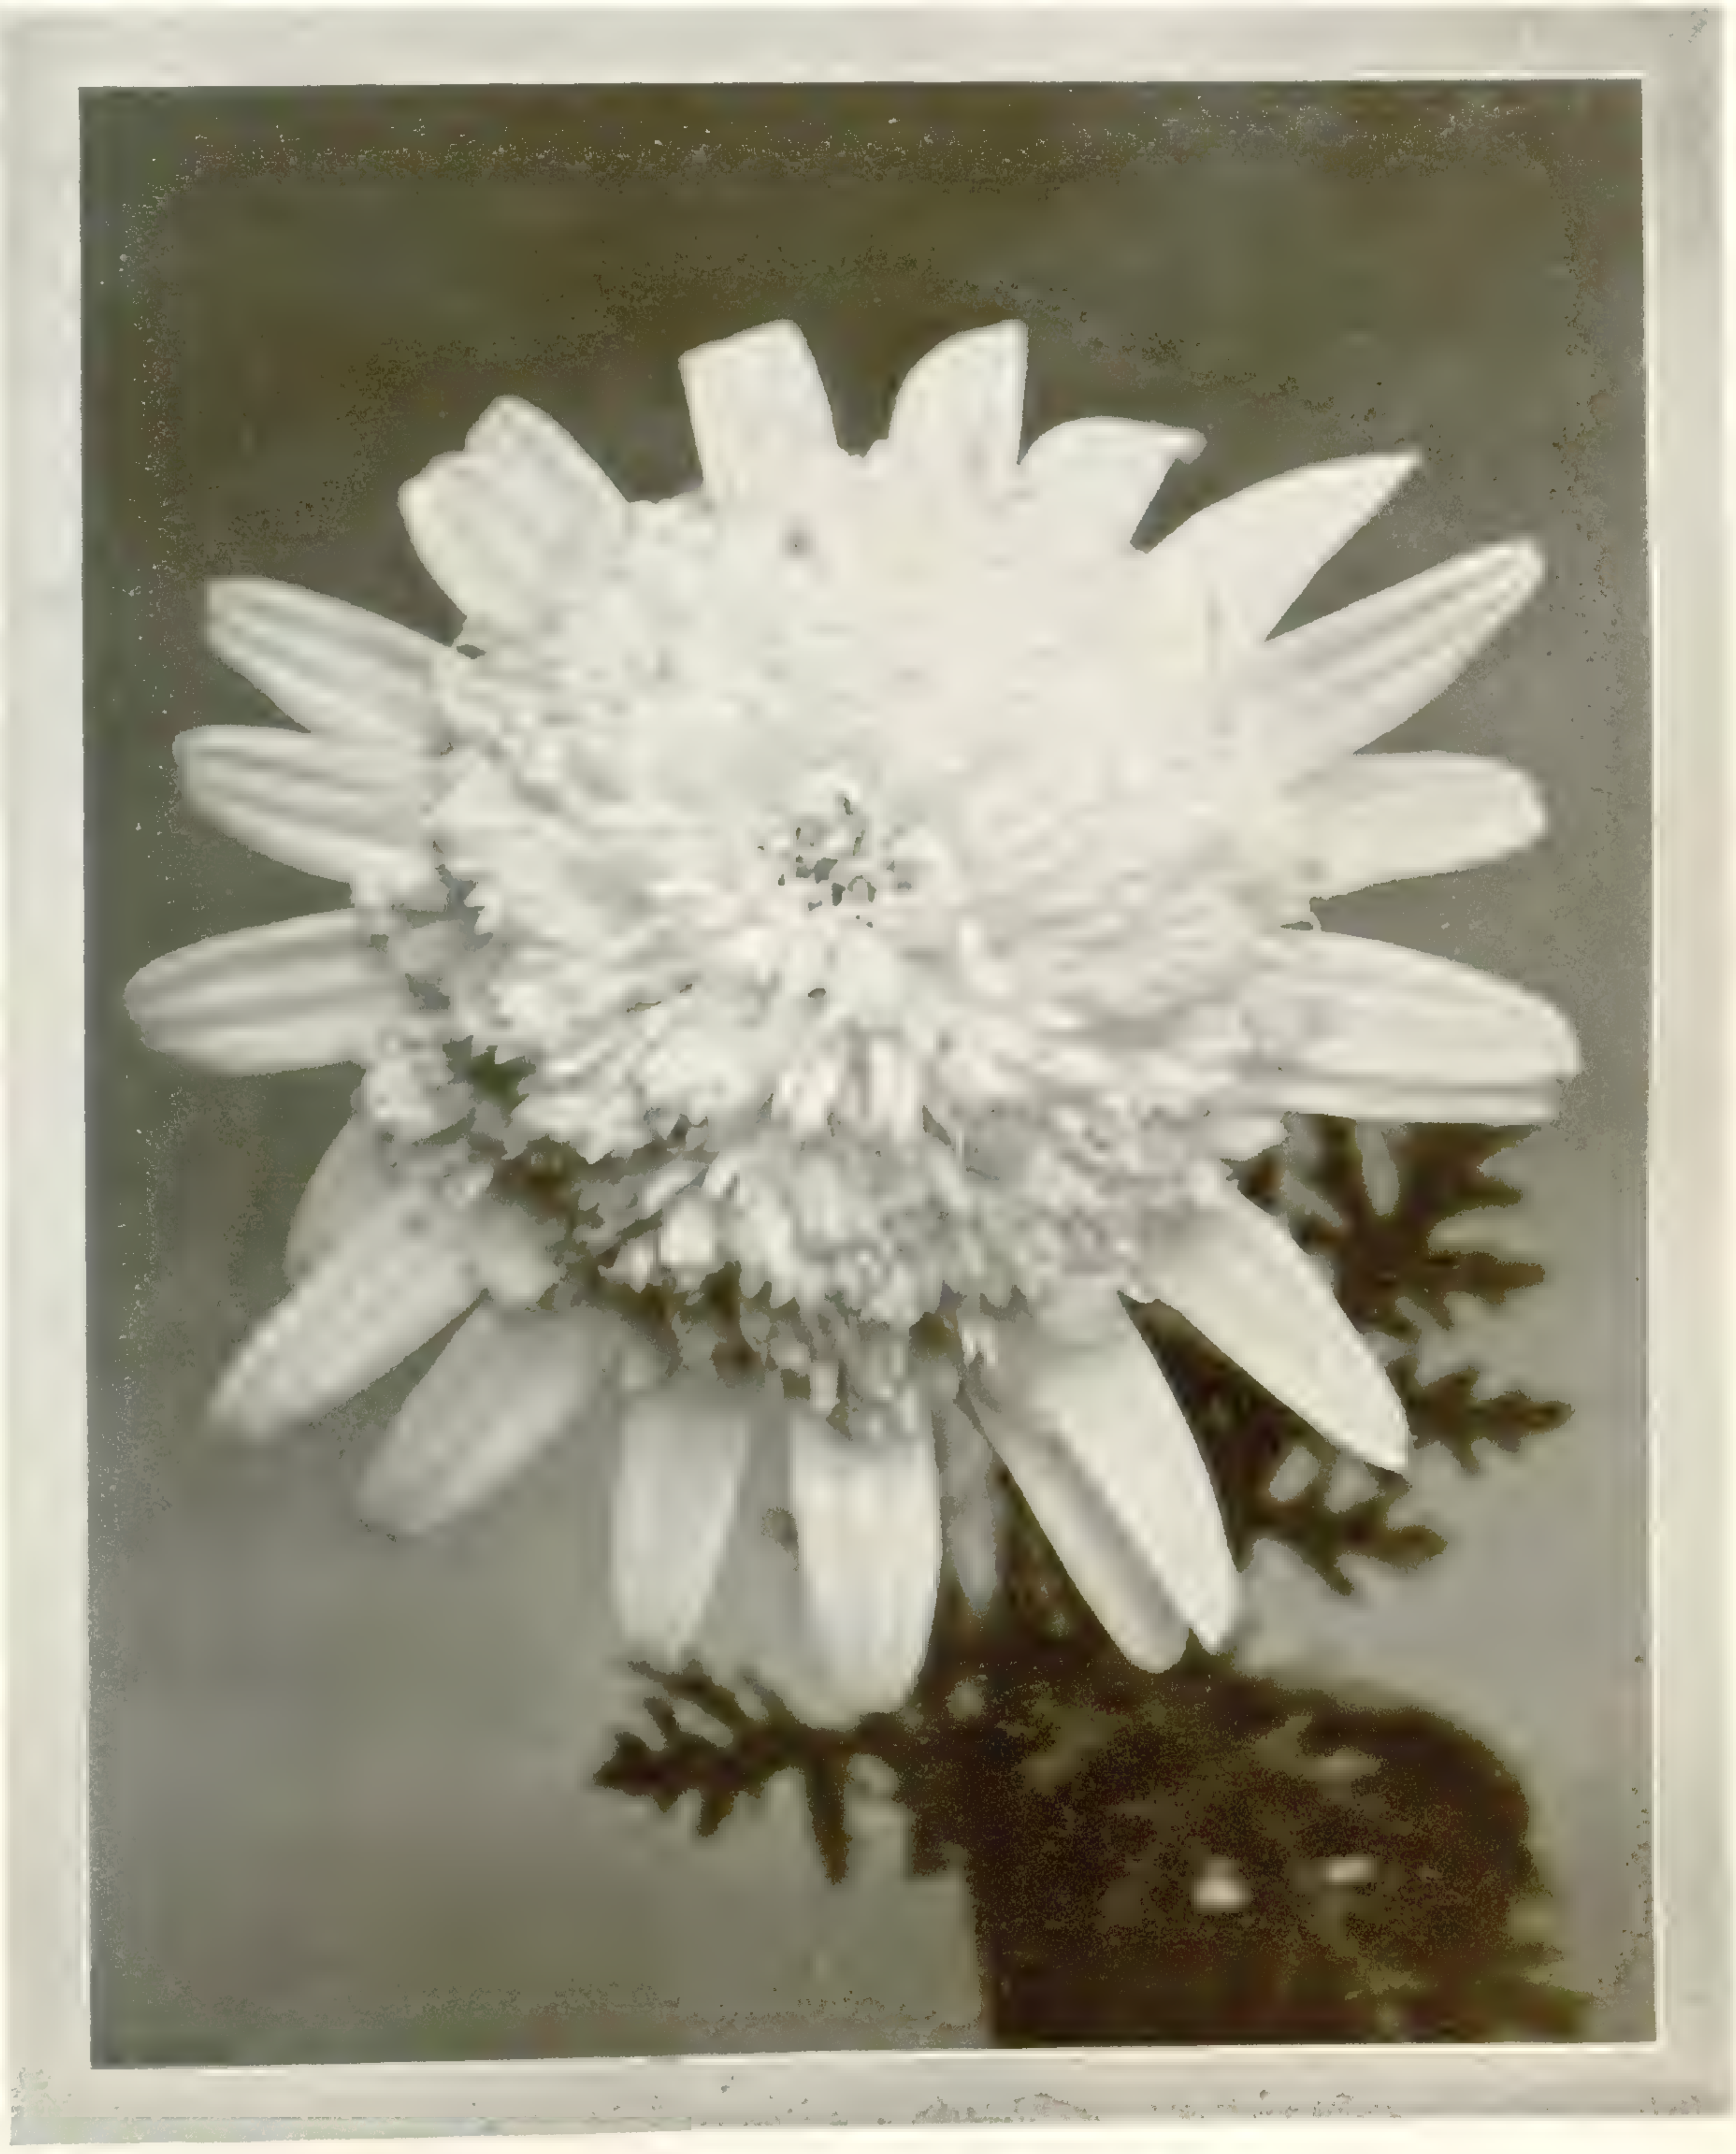
To my mind, this is just the time to apply artificial manures, if they are to be used at all, and to keep the hoe going.

Uckfield. A. Piper.

Onions.—These will now require thinning, and to be settled in by watering as each row is thinned, should it be hot at the time. If the bed needs filling up choose a showery day, if possible, for this work. No hard or fast rule can be laid down as to the thinning distance, it being best to observe from the nature of the soil how far apart we can leave them in the rows. Even at three inches apart the resulting bulbs come to an excellent size and weight.—G. E.

CÆSALPINIA JAPONICA.

This handsome leguminous shrub was introduced from Japan by Messrs. J. Veitch and Sons, and figures of it appeared upwards of twenty years ago, yet it is now comparatively little known. The original plant, or one of the oldest plants, grew for many years in the Coombe Wood Nursery, where it blossomed almost every year. It is of rampant growth, and forms a rather straggling shrub, with long, intensely spiny branches, and large compound leaves made up of numerous small dainty green leaflets. The flowers are borne during July and August in good-sized racemes, twenty-five or more flowers being found in each.



TEMPLE SHOW—MARGUERITE MRS. F. SANDER.

A.M., R.H.S., May 24, Messrs. Sander and Sons, St. Albans. Flowers pure white, about five inches across.

The individual flowers are about an inch across, and yellow in colour, with red stamens, the whole forming a very striking combination. In cold districts the ends of the branches are cut back in winter, but, as a rule, the lower parts of the stems survive. In the event of very severe frost being experienced it would, however, be wise to place a little bracken among the branches and over the roots.

The best position for this shrub is against a low fence, where it can ramble at will, and it should be exposed to full sun. Either sandy or heavy loam suits it. It is difficult to propagate, but succeeds moderately well from layers. W. D.

THE GARDEN OF HERBS.

"Here's flowers for you;
Hot lavender, mints, savory, marjoram,
And marigolds that goes to bed with the sun,
And with him rises weeping."
— Shakespeare.

Floating back from the past, as with a wave of incense, there are many quaint memories and associations, and of these not a few are connected with the old-time flowers of our gardens. In an antique chest, out of which the writer was clearing documents and papers, he came across a sprig of lavender tied with a blue ribbon: it had laid there for probably half a century, for the papers, which belonged to the gentleman owning the chest, were dated fifty years back, yet its scent still lingered amongst the documents, and whether it was a love token or a charm one can but surmise.

TEMPLE SHOW ROSE DUCHESS OF WESTMINSTER.

A.M., R.H.S., May 24, Messrs. A. Dickson and Sons, Newtownards. A beautiful H.T. variety of fine form and size: the colour is rich rose-pink, almost rose du Barri shade, with charming silvery suffusion on the outer petals.

In all well-conducted gardens it is usual to have some portion at least set apart for the cultivation of herbs, and this is best, for ofttimes in other gardens it is a trouble to find what one wants, perhaps it may be some rosemary, rue or lavender, borage or mint, some sage or some thyme, that is required, and the border in the kitchen garden is searched; but is it not better to have a garden specially set apart for the growth of herbs, whether the garden be large or small? For this purpose it is desirable to have a piece of ground in a sunny open position thoroughly dug and trenched; it should then be enriched with old decayed farmyard manure, lime should be incorporated, sand should be added, and plenty of leaf-mould well mixed: the garden should then be neatly bordered with box, which should be allowed and encouraged to grow two feet high at least, a few narrow walks may be permitted, and all the plants should be neatly labelled, and, if desirable, a large label, entitled "The Herb Garden" or "The Herbary," placed in the centre.

Lavender.

We will now refer to the principal herbs which should be planted in the herbary; of these, lavender has, perhaps, been the most popular; its associations come from its perfume. When carefully put away amongst linen and clothes, placed with care in wardrobes, lavender keeps moths at a distance, and produces a lovely fragrance. Its scent, too, is so lasting, perhaps the most lasting of all. A hedge of lavender in a garden is a joy for ever, growing year after year stronger and more pungent, scenting its perfume on a southerly wind with royal largesse, and waving its tall grey feathery flowers in gentle rhythm. Lavendula is the pretty Latin word from which our English one is derived, and the common Lavender (L. vera) grows wild on rocky mountains on the balmy shores of Southern Europe; the Narrow-leaved Lavender (L. angustifolia) is also found there, and is generally cultivated in gardens, growing readily from cuttings taken in spring or autumn; the Broad-leaved Lavender (L. latifolia or L. spica) is also a native of the South of Europe, but it is from the former that the celebrated oil of lavender is made. The oil is procured by the distillation of lavender flowers with water, and lavender water is made from it, and is one of the most popular of perfumes.

Rosemary.

Rosemary is another favourite herb. It grows into a large shrub, varying from four to eight feet in height, and at Christmas its sprigs are used for decorating the dwelling-houses. Herrick, referring to it in his poem on Candlemas Day—

"Down with the Rosemary, and so
Down with the bays and mistletoe,
Down with holly, nay, all,
Wherewith you dressed the Xmas hall."

Rosemary for remembrance is the language of the plant, and Ophelia, speaking to Laertes, in "Hamlet," Act IV., sc. 5., says:

"There's Rosemary, that's for remembrance.
Pray you, love, remember;
And there's pansies, that's for thoughts."

But Kirke White, in a poem, associates the plant with more sombre topics. He writes:

"Come funeral flower, who lovest to dwell
With the pale corse in lonely tomb,
And throw across the desert gloom,
A sweet decaying smell."

There is only one species of rosemary known, namely, Rosmarinus officinalis; it has pale bluish flowers, and grows on rocks and old walls in the countries by the Mediterranean Sea, but is grown here as an aromatic shrub. Oil of rosemary is made from the plant; it is used in preparations said to promote the growth of hair. There is a beautiful white honey from Narbonne which owes its reputation to the flowers of this plant, the bees of the district drawing the honey from its nectaries. It belongs to the natural order Labiatæ, and is allied to the sage. It is easily propagated by cuttings inserted in sandy soil in spring.

Sage.

The well-known herb sage, so popular at Christmas time when used in seasoning, comes next in our list. It also grows wild in the South of Europe. It is one of the renowned salvia family, and is known as Salvia officinalis. It is seen at its best on dry soils, and is easily grown from cuttings; it also contains an essential oil, but is chiefly now used for garnishing. Of wild flowers the Meadow Sage, or Clary (S. pratense), and the Apple-bearing Sage of Europe (S. pomifera) are well known. The peasantry of Crete collect the galls which grow on the latter and sell them for making sweetmeats. The salvias have very beautiful flowers, and are ornaments of the hardy border and greenhouse. Jerusalem sage has a quaint yellow whorled flower of great oddity, but it is not a salvia, but a phlomis.

Rue.

Rue is another herb often referred to, and is the real "herb o' grace." Ophelia refers to it in Hamlet when she addresses Laertes:

"There's fennel for you, and columbines:
There's rue for you; and here's some for me:
We may call it herb-grace o' Sundays:
O, you must wear your rue with a difference."

Rue was called herb of grace because it was formerly used by the priests and monks for sprinkling the people with holy water, and in the time of Aristotle it is referred to as being used as an amulet against witchcraft: in some cases the syrup of rue is used as a stomachic for children's ailments. The Garden Rue (Ruta graveolens) grows in sunny, stony spots in countries bordering on the Mediterranean Sea; it has greenish-yellow flowers, and may be cultivated by cuttings and offshoots in the spring.

Angelica.

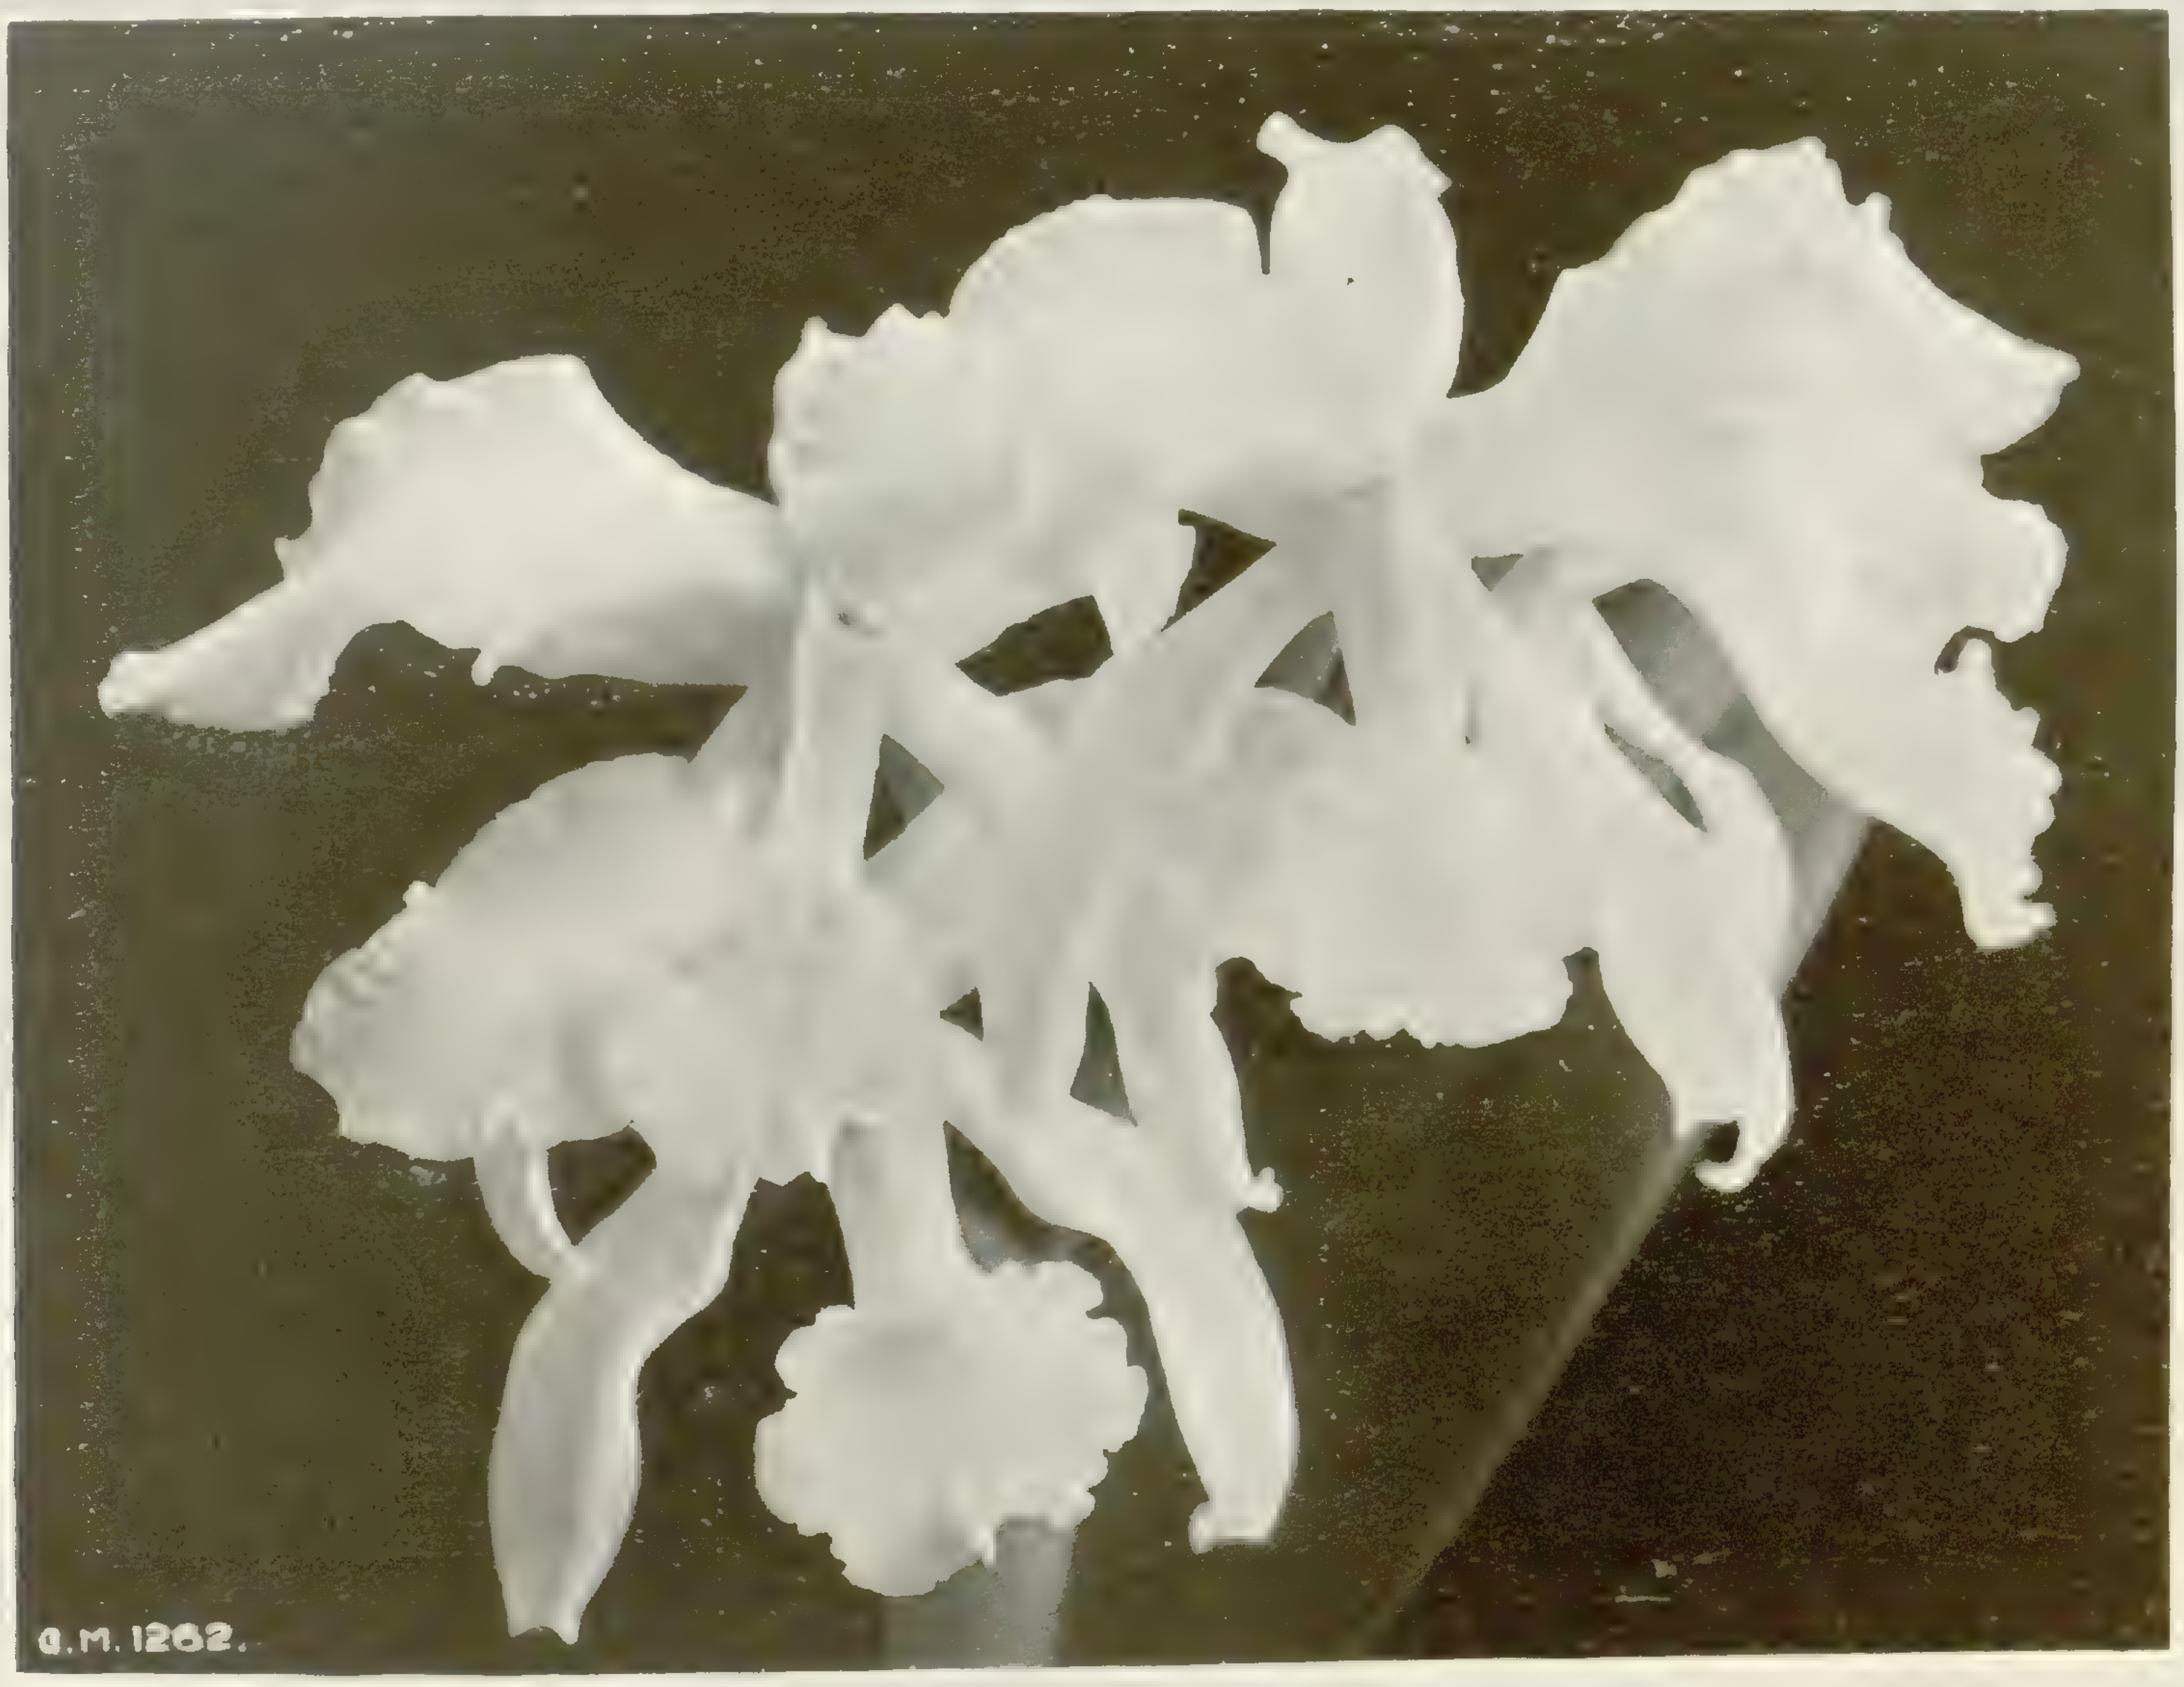
Angelica (A. archangelica) is another handsome shrub, growing to a height of three feet; it is a native of these islands, and is used for flavouring confectionery and liquors; it is called locally ground ash, and may be propagated by seeds sown half an inch deep in April. It derives its name from its supposed angelic virtues in medicine, and was said to possess qualities which prevented the evils of witchcraft. It belongs also to the natural order of Umbelliferæ.

Thyme.

Shakespeare has immortalised thyme in his beautiful lines, so graphically realistic, so charmingly sympathetic, and yet embracing a subject lying at one's feet:

> "I know a bank where the wild thyme grows,
> Where ox-lips and nodding violet blows,
> Quite over-canopied with luscious woodbine,
> With sweet musk roses and with eglantine."

The wild Thyme (Thymus serpyllum) is, however, much smaller than the garden variety, Thymus vulgaris, which grows six to ten inches in height, and was introduced into England three or four centuries ago; it is a native of Spain and Italy. There is another species of the wild thyme, which is called lemon thyme, but it is of smaller growth than the garden varieties. Nearly all the herbs we have mentioned belong to the natural order Labiatæ, or lipped flower order, but these minute differences are rather for the botanist than the general reader. Thyme is used for flavouring, and in medicine as a strong stimulant. Oil of thyme is also obtained by distillation. This plant is easily propagated by cuttings at almost any time of the year except during the flowering season.



TEMPLE SHOW—CATTLEYA LAWRENCEANA MARY REGINA.

F.C.C., R.H.S., May 24, Messrs. Charlesworth and Co., Haywards Heath. A fine albino, and the first one of this species that has yet appeared. Wholly white except for the faintest tint of blush on the apex of the lip and the palest possible yellow stain in the throat.

Fennel and Parsley.

Fennel is useful for its leaves, which are boiled and served up with mackerel and salmon, or other fish, and are used to form a sauce for them. It is allied to dill, and belongs to the Umbelliferous or umbrella-headed plants, such as wild carrot, parsley, and parsnip; it is also a biennial, growing from three to four feet high. Oil of fennel is made from it, and it is a native to some parts of England.

Parsley and its uses are so well known to everyone that it is not necessary to refer to them save to say that no garden should be without it either in summer or winter, as it is one of the best of all seasoning plants.

Dill and Anise.

Dill is a native of the countries round about the Mediterranean Sea; it belongs also to the Umbelliferæ, and is an annual or biennial plant, used as an aromatic, stimulant, and carminative; also like anise in cookery, and in medicine as the well known dill water. The common dill is called Anethum graveolens.

Anise (Pimpinella anisum) is a native of Egypt, and similar warm countries, and from it is produced the famous aniseed; it also belongs to the Umbelliferæ. It is occasionally sown here in gardens for a garnish or seasoning.

Balm and Borage.

Balm (Melissa officinalis) has been naturalised in some places in England, and its stem and leaves are used as a gentle stimulant; it also belongs to the order Labiatæ, and is a native of the Mediterranean coast. It was used in early times for the purpose of anointing, and the following immortal lines were written in reference to this high office:

> "Not all the water in the rough, rude sea,
> Can wash the balm from an anointed king."
> —Shakespeare.

The writer pictures a bed of borage in an old-fashioned walled-in garden one springtime, its deep blue flowers, with dark purple anthers, still lingers in his memory. Borago officinalis is one of the handsomest of the herb family, and its leaves are used in "claret cup" to the present day. Gerard refers to its leaves when he states: "There is also many things made of them used everywhere for the comfort of the heart, for the driving away of sorrow, and increasing the joy of the mind." Its leaves are still used in Germany in salads, and its tender tops are pickled, and occasionally boiled for the table. It is also a native of Europe. Walter Smyth.

(To be continued.)

Brooklyn Botanic Gardens.

Plans are now being made for the new Botanic Gardens and Arboretum which will be located in Institute Park, Brooklyn, N.Y. We learn that the Institute of Arts and Sciences has an annual fund of £400 to £500 for the purchase of plants, while the city will furnish the land and maintain the gardens. Dr. C. Stuart Gager, director of the department of botany at the University of Missouri, has been engaged as director at a salary of £800.

NEW PLANTS, ETC.

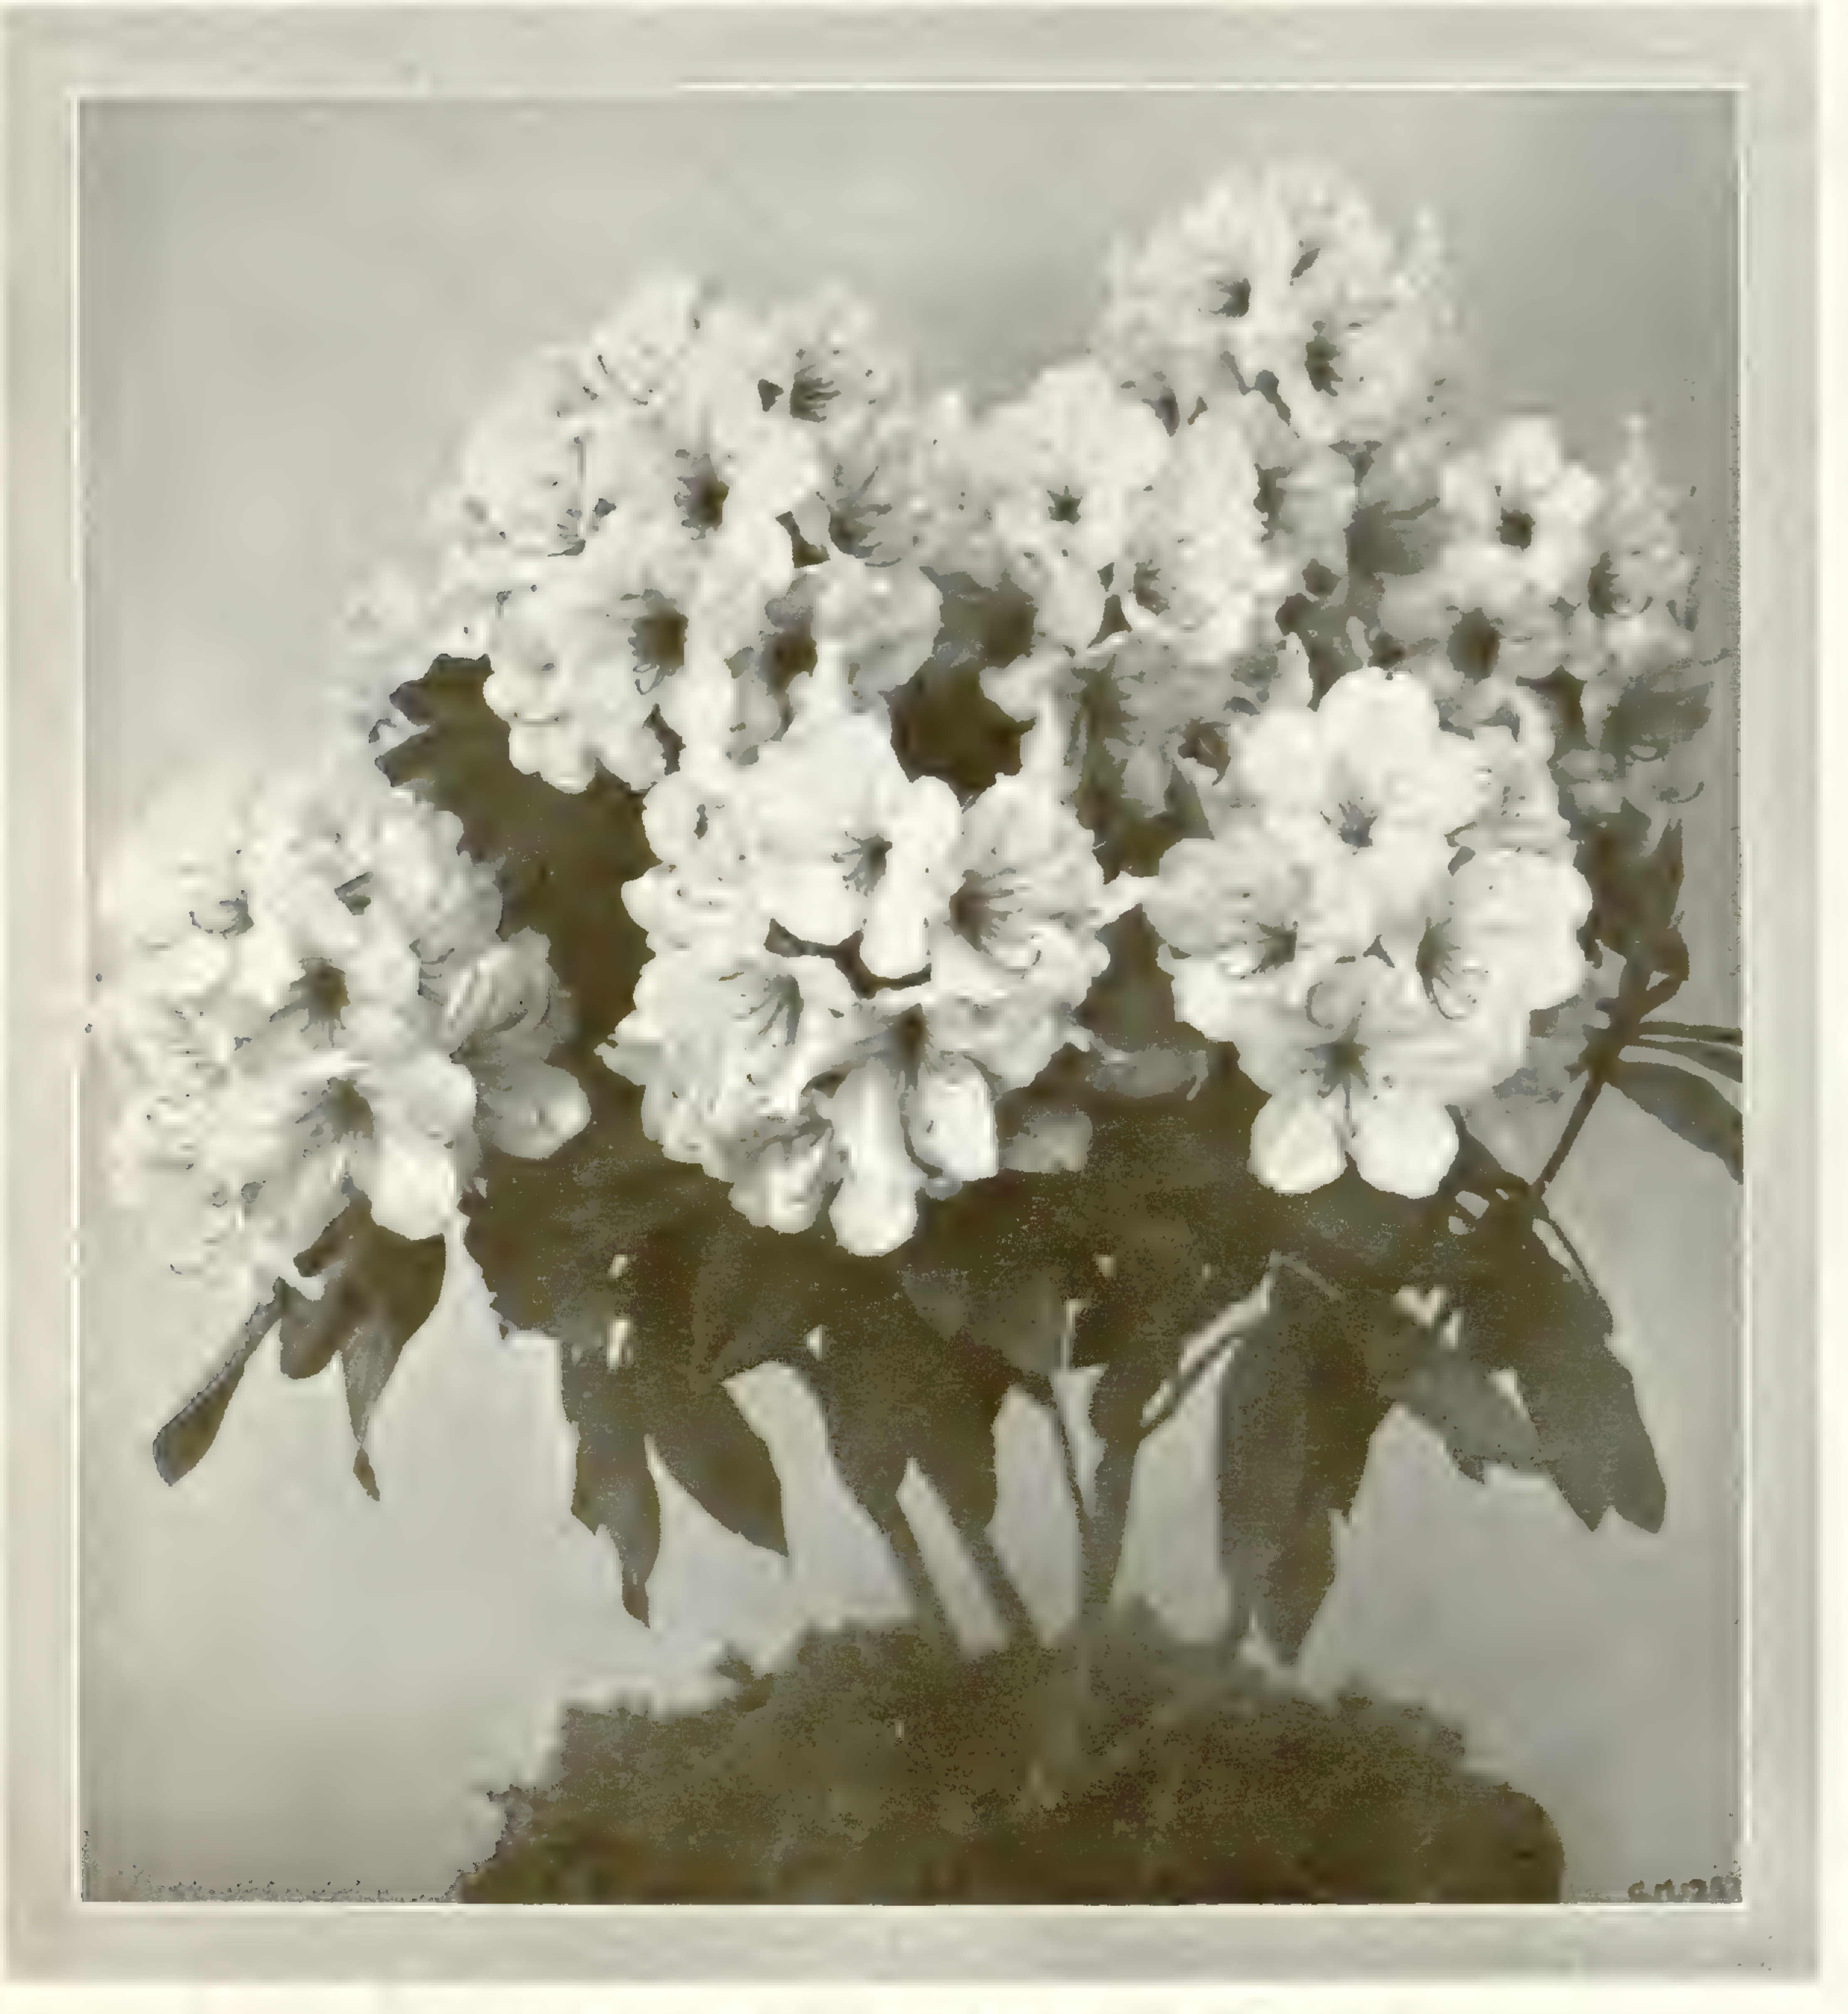
◆

CATTLEYA MENDELI PRINCESS VICTORIA.

This is a delightful form of a fine old species, and it has large, shapely flowers of great beauty. The sepals and petals are white, fading to deep blush after the flowers have been open for a week or two. The white lip has a pale yellow throat, veined with purple, and the broad apex to the lip is charmingly fringed and stained, and edged with rich rosy-purple. Altogether a very fine orchid. F.C.C., R.H.S., May 24. Messrs. Mansell and Hatcher, Rawdon, Yorks.

LÆLIO-CATTLEYA LUMINOSA VAR. MAGNIFICA.

A very brilliant form of a showy hybrid. The sepals and petals have an orange-buff foundation, overlaid with rich bronzy crimson, this colour being most highly developed on the petals. The large lip is very dark old rose colour, heavily marked with deep crimson, and with lighter veins in the throat. A.M., R.H.S., May 24. His Grace the Duke of Marlborough (gardener, Mr. Hunter), Blenheim Palace, Woodstock.



TEMPLE SHOW—RHODODENDRON ALICE.

A.M., R.H.S., May 24. Messrs. J. Waterer and Sons, Bagshot. An exquisitely beautiful large flowered variety, bearing rich rose-pink flowers in large trusses.

LÆLIO-CATTLEYA APHRODITE VAR. MARK HAMBURG.

A bold and handsome variety of this beautiful orchid. It has very large blooms with a spread of about eight inches. Sepals and petals are pure white, and sufficiently substantial to stand up well. The big lip is rich purple with a well-defined wire-edge of rose, and a well-defined white, light yellow-stained throat. A.M., R.H.S., May 24. J. T. Clifton, Esq., Lytham Hill, Lytham, Lancashire.

ODONTOGLOSSUM MEMORIA KING EDWARD VII.

A remarkable odontoglossum of the ardentissimum class, bearing nine large rounded blooms of great substance and wonderful colouring, the greater part of each bloom is deep rosy-purple, almost a soft deep crimson shade, but this is barred and veined lightly with pale rose and white, and round each segment is a border of white, that is flushed here and there with rose. The lip has a crimson base and deep golden crest, and a pure white apex. A grand and startling novelty. F.C.C., R.H.S., May 24. Messrs. Sander and Sons, St. Albans.

ODONTOGLOSSUM EXIMIUM VAR. EMPEROR.

A beautiful and showy odontoglossum carrying ten large blooms of fine shape. The sepals and petals are all of about the same size, rich red-brown, bordered and tipped with blush or soft pink. The lip is of deeper red-brown colour, marked with yellow, and with a pure white apex. A fine form of the cross between O. ardentissimum and O. crispum. A.M., R.H.S., May 24. Messrs. Sander and Sons, St. Albans.

ODONTOGLOSSUM PROMERENS.

A very handsome variety, very like a form of O. crispum. The flowers have very broad segments, white, very heavily blotched in irregular fashion with intense maroon-scarlet, the markings being especially heavy and brilliant on the broad petals. The spike exhibited carried five flowers. A.M., R.H.S., May 24. Mons. Chas. Vuylsteke, Loochristy.

ODONTOGLOSSUM EXIMIUM EMPRESS OF INDIA.

In shape and size this is a very lovely orchid. The ground colour is pale rosy-blush, almost white, but this is chiefly evident as marginal colour and irregular veinings through the solid maroon colouring that occupies the greater part of the sepals and petals. The rather large lip is white, with a few spots of deep maroon-red at the base, close up to the small yellow crest. F.C.C., R.H.S., May 24. Mons. Chas. Vuylsteke, Loochristy, Ghent.

MILTONIA MEMORIA BARON SCHRODER.

A lovely and very distinct variety of Miltonia vexillaria. It has large blooms that are faintly rose-coloured, this colour shading to white towards the apices of the sepals and petals, and the margins of the lip. At the base of the broad lip, on a white ground, is a fine blotch of rich crimson with rays of colour extending into the white area. A charming and distinct variety. F.C.C., R.H.S., May 24. Messrs. Sander and Sons, St. Albans.

RHODODENDRON ALICE.

This is a magnificent addition to our list of hardy rhododendrons, and one that bids fair to become as popular as the lovely Pink Pearl. The new comer has huge trusses of large, widely-expanded, beautiful rich rose-pink flowers, the colouring being slightly paler in the centre of the petals. Some of the big trusses carry as many as twenty blooms, and as a comparatively small plant a yard high will carry a dozen such trusses, some idea of the grand effect the variety produces may be formed. A.M., R.H.S., May 24. Messrs. J. Waterer and Sons, Bagshot, Surrey.

RHODODENDRON PRINCESS JULIANA.

A delightful large-flowered rhododendron, with large trusses of broad, widely-opened flowers of pure white, the edges beautifully waved. As the flowers age they develop a blush shade. It is a grand addition, and with Pink Pearl and Alice forms a grand trio. A.M., R.H.S., May 24. Messrs. J. Waterer and Sons, Bagshot.

CYTISUS DALLIMOREI.

This is a very distinct, interesting, and pretty hybrid, obtained by crossing Cytisus albus with C. Andreanus. It is a very free-flowering, erect-growing shrub, the standard of each flower being pale pink, and the wings deep rose-red; the stamens and the inner side of the keel are pale yellow. In general appearance this pretty new-comer shows very little of the influence of C. Andreanus. In general effect it is a bright rosy-flowered shrub. A.M., R.H.S., May 24. The Director, Royal Gardens, Kew.

SOBRALIA CHARLESWORTHI.

A distinct and strong-growing new species, six feet or more high. It bears large flowers, and has broad mauve-purple sepals and petals that have slightly fringed margins. The lip is very large for the size of the flower, oval in outline, with a rose-purple centre stained and marked along the centre with soft yellow. Around the whole of the lip is a broad wavy border of intense deep maroon-purple. A very striking novelty from Columbia. F.C.C., R.H.S., May 24. Messrs. Charlesworth and Co., Haywards Heath.

SARRACENIA WILLMOTTÆ.

A handsome and bold sarracenia obtained by crossing S. purpurea with S. Stevensi. It grows about a foot or fifteen inches high, and has very broad apple-green pitchers, heavily and reticulately veined with dark and deep crimson-purple. The expanded mouth of the pitcher has a spread of nearly six inches, and a depth of about three inches. It is a very fine addition to a very interesting group of plants. A.M., R.H.S., May 24. Mr. A. J. Bruce, Chorlton-cum-Hardy, Manchester.

ODONTIODA KING GEORGE V.

An exquisitely beautiful bigeneric hybrid, one of the largest and most distinct yet produced. The spike shown bore seven rounded flowers, the largest nearly three inches across. The sepals and petals are rosy, with a purple flush at the tips, and bright red-brown, quite approaching a scarlet hue, all over the centre and base, this colour being broken up by veins of buff, and with a crescent of this colour on the petals. The neat lip has a broad golden crest, is yellow, pink tinged, and spotted with bright red at the base. A very beautiful flower. F.C.C., R.H.S., May 24. Mons. Chas. Vuylsteke, Loochristy, Ghent.

ODONTIODA ROYAL GEM.

Another lovely form, with bright red colouring, broken up into more or less confluent clusters of spots, these growing smaller until towards the margin of the sepals and petals they are tiny speckles. The ground colour is blush, shading to rose at the margins. The lip is white and rose, with a few dark red spots and a bright yellow disc. A.M., R.H.S., May 24. Mon. Chas. Vuylsteke, Loochristy, Ghent.

MARGUERITE MRS. F. SANDER.

This is a charming and delightfully beautiful plant, and one that is almost sure to be very extensively grown both in private gardens and for the market. Many of the plants carried a dozen large blooms of the purest white, and the long stems suggest a great usefulness of this variety for floral decorations. Some of the flowers measured five inches across. There is a circle of about two dozen broad ray petals or florets, forming a setting for the broad, raised, anemone-like centre composed of row upon row of short, fringed, pure white disc florets. The whole flower suggests a glorified and refined pyrethrum, and the deeply cut and elegant leafage below adds grace to it. A.M., R.H.S., May 24. Messrs. Sander and Sons, St. Albans.

ROSES.

Duchess of Westminster.—A broad-petalled H.T. rose of beautiful form and fine size. The colouring is difficult to describe; rose-pink does not properly convey the shade, but rose du Barri colour is nearer the tint seen, but this is charmingly suffused with silvery-rose on the outer petals. A.M., R.H.S., May 24. Messrs. A. Dickson and Sons, Newtownards.

Excelsa.—A showy addition to the rambling section. It belongs to the Wichuraiana group, and bids fair to out-rival Crimson Rambler. The flowers are double and borne in large elegant clusters, and they are of a rich red colour. When they fade the flowers shade into a rosy hue, and not the magenta shade that is so objectionable in faded blooms of Crimson Rambler. A.M., R.H.S., May 24. Messrs. Paul and Son, Cheshunt.

BEGONIA ROSE QUEEN.

A handsome tuberous begonia with blooms of immense size and a delightful shade of rich rose. A further attraction is the beautiful waving of each row of petals. A.M., R.H.S., May 24. Messrs. Blackmore and Langdon, Twerton Hill, Bath.

CATTLEYA MOSSIÆ MAGALI SANDER.

A distinct and beautiful variety with pure white sepals and petals, and bright mauve-purple stains on the apex of the yellow and white lip. A.M., R.H.S., May 24. Messrs. Sander and Sons, St. Albans.

CATTLEYA MENDELI QUEEN MAUD.

This is a pretty variety with white sepals and petals, and a bluish magenta apex to the lip. A.M., R.H.S., May 24. Messrs. Charlesworth and Co., Haywards Heath.

CATTLEYA LAWRENCEANA MARY REGINA.

A beautiful and distinct variety of an old and well-known species. Nearly seventy years ago the typical C. Lawrenceana was introduced, and from then until the present occasion no albino form has ever appeared. In the variety Mary Regina the sepals and petals are purest white, and the lip is of similar whiteness, except for a very faint blush tinge at the apex of the lip and a very pale yellow stain in the throat. F.C.C., R.H.S., May 24. Messrs. Charlesworth and Co., Haywards Heath.

NOTES FROM KEW.

In my notes which appeared in the GARDENERS' MAGAZINE of April 30 reference was made to the typical form of that striking Aroid, Lysichitum camtschatcense, whose golden blossoms were then at their best, and which has now developed its noble tuft of handsome leaves. Close by, in the same structure, namely, in the cool portion of the Temperate House, a plant of the variety album is now bearing several of its white spathes, and very pretty it is when in that stage. Though later in flowering than the typical form, this feature of the white-flowered variety would appear to be only an accidental one, as the specimen appears to have been newly planted. While Lysichitum camtschatcense itself is decidedly uncommon, the variety album appears to be quite rare, at all events, it is the first time that it has come under my notice.

Rhododendron Victorianum is a beautiful hybrid, now in flower in the Himalayan portion of the Temperate House,. and is one of the most striking of all the tender garden forms. Such being the case, it is a matter for surprise that it is not more often met with, for it was raised in Belgium over thirty years ago. It is a hybrid between R. Dalhousiæ and R. Nuttalli, and as a garden plant, at least in a small state. is decidedly superior to either of its parents, being more compact and free flowering. The blossoms, which are for the most part borne three or four in a head, are individually four inches or so in length, and the same across the expanded mouth, the segments of which are recurved in a pleasing manner. In colour they are of a clear milk-white tint, with a suspicion of yellow in the throat. They are deliciously fragrant. As a parent R. Dalhousiæ has given us the popular Countess of Haddington, but R. Nuttalli does not appear to have been much used by the hybridist. Such a delightful form as R. Victorianum should, however, serve to direct attention to the possibility of further triumphs among this noble class of plants.

Much has been written concerning the beautiful and popular Rhododendron Pink Pearl, whose hardiness in most districts is unquestioned. Still, after the plants out of doors have been subjected recently to 10 degrees of frost they cannot be expected to vie with those which have been protected

TEMPLE SHOW—BEGONIA ROSE QUEEN.
A.M., R.H.S., May 24, Messrs. Blackmore and Langdon, Bath. Flowers large, of beautiful form, and rich rose colour.

therefrom. A specimen in the Temperate House shows this variety at its very best, and also serves to direct attention to its great value for cool house decoration at this season.

Clematis aristata Guilfoylei is an Australian species now flowering freely in the cool portion of the T range at Kew; it is a good deal like the New Zealand Clematis indivisa. The foliage is lobed, as in Clematis indivisa lobata, and the flowers are also similar, but less showy, owing to the smaller petals. It, however, possesses one notable feature, and that is the reddish tinge in the centre, which suggests the possibility that in time a coloured form might be evolved. On this point one cannot fail to note that we have now a coloured variety of Clematis montana, which is, however, not of garden origin.

When one remembers the many failures that used to occur in the attempts to successfully cultivate Clianthus Dampieri the presence of thriving specimens year after year at Kew serves to show that its requirements are now better understood than they formerly were. The success achieved at Kew seems to be owing to the employment of seedlings of the common bladder senna as stocks on which to graft young plants of Dampier's clianthus. This, combined with liberal treatment and a total absence of coddling, yields highly satisfactory results.

Kew has been remarkably fortunate in raising some desirable members of the Broom family, and Cytisus Dallimorei is one of the latest to show its charms. Of the Kew-raised forms C. Kewensis is of strictly procumbent habit, and bears cream-coloured blossoms; C. Beani, a low-growing plant, has rich golden-yellow flowers, but the C. Dallimorei is quite a break away. This is, I believe, the result of a cross between Cytisus albus and Cytisus Andreanus. The flowers have a rich velvety keel, with a purplish tinge, and the rest of the flower is more or less of a rosy-pink shade. In the bud state it is purplish-rose. It is of free upright growth, and is undoubtedly a great acquisition to the hardy brooms. K.

Celery.—This is often the most important crop in the kitchen garden, and it is always advisable to maintain a supply from an early to a very late period. No crop appreciates good treatment more than this, therefore every care should be given to the preparation of the trenches and after treatment. Prepare trenches three and a-half feet apart for the early batch, and four feet for the main crop; take out the soil with a spade, one foot wide, and the same in depth; break the bottom up with a fork, and place on this four inches (when trodden) of decayed farmyard manure, finishing off by chopping the sides of the trench on to the manure, and mixing with this some old marrow-bed or similar material, and soot. In heavy soils it is an advantage to put the plants almost on the ground level, leaving only sufficient depth to facilitate watering. Celery will be found to stand the wet winter weather quite safely under this mode of culture. On very light soil, which is naturally drained, a foot below the surface will not be found too low for planting. The early batch should now be quite ready for planting out; place the plants ten inches apart in single lines, and plant firmly. Dust with soot every ten days to ward off the celery fly and to prevent the slugs doing damage. Prick off main crop under old lights, or in sheltered situations, and make one more sowing for planting on the level ground, but not to be earthed-up. In the spring this batch will throw up green succulent stems, which form a most delicious vegetable.—G. Ellwood, Swanmore Park Gardens.

EUCHARIS AMAZONICA.

Some cultivators find this plant a very difficult one to grow, whereas others do not experience the slightest difficulty in securing excellent supplies of the lovely pure white flowers.

About twenty years ago, I remember, when the "mite" was causing so much havoc in many collections, Mr. W. Bardney, then head gardener at Norris Green, Liverpool, took a vast amount of interest in the matter, and gave, through the horticultural Press, his experience of the "mite," and the treatment adopted. I have forgotten the details of the treatment advocated, but I know that Mr. Bardney rendered great service at that time.

Not only did the "mite" prevent some cultivators growing the plants, but others were not able to grow them satisfactorily even when the bulbs were quite free from the pest. I may say that years ago I never experienced any difficult in growing large batches well, but I have never had many under my charge since the time that I new refer to.

There were two notable cases. I shall never forget the struggle in one large garden to grow the eucharis even moderately well, and the failures that occurred, and the ease with which they were cultivated in the other garden. The establishments were situated about a dozen miles apart in one of the northern counties. From the successful collection specimens were selected and taken to the other garden, but in a very short time the new plants looked as dilapidated as the others. As a young man I was greatly interested, and paid a visit to the garden in which the eucharis was so well managed. When I entered the house in which the main batch was growing, I heard some voices, but could not see anyone. Presently, however, some heads poped up amid a thicket of foliage; several young men were seated on empty inverted flower pots engaged in sponging the leaves, but the plants were so huge and healthy that they hid from view men seated as stated.

I had previously been told that tiny bulbs, if thrown down on a bed of soil in one of these houses, would grow. Well, when I entered the structure referred to I noticed a number of small bulbs lying on the surface of the soil in an open propagating frame, and roots were freely entering the soil from them, the leaves had turned to the light, and were growing, too. This collection was entirely free from the "mite." The soil used for the plants was a rather heavy yellow loam.

I have had charge of several collections since that time, and never have failed to grow the plants satisfactorily, but in the "bad" case referred to above I assisted in the work of cultivation, but entirely without success. Now, disease-free plants were kept away from those that were unsatisfactory, but all efforts to grow them well were unsuccessful. The soil was good, fibrous, and a little lighter than that in the other garden

Where the "mite" exists it must be eradicated before the eucharis can be induced to grow, and extreme cleanliness, both of bulbs and foliage, is absolutely necessary; but I am at a loss to understand what there could possibly have been in the soil or the atmosphere that prevented plants, free from the "mite," growing satisfactorily in one place and not in the other.

Perhaps some readers of the Gardeners' Magazine can explain.

George Garner.

SOIL STERILISATION.

Having recently received a series of questions relating to the important subject of soil sterilisation, and being quite unable to answer them at length to each person I beg, through the medium of the Gardeners' Magazine, to make a few remarks which may be of service to gardeners generally.

The sterilisation of the soil, which has been heated to the temperature almost of boiling water by the injection of steam from a high-pressure boiler, has recently received considerable attention, both in this country and on the Continent, especially in greenhouses, conservatories, and glass frames. Some of the most successful growers also sterilise their compost soil for outdoor beds. If this is properly done it destroys all nematodes (eelworms), grubs, and all plant and animal parasites likely to attack the growing plant roots. All organisms of an order higher than bacteria will be killed off, and certain organisms which normally limit the number of bacteria in the soil are destroyed.

From a series of recent experiments made at the Rothamsted Agricultural Station it has been found that when the soil is thus cleared of hurtful agencies the ammonia-producing bacteria increase rapidly, and there is a considerable increase in the production of plant food from the soil and manure employed, followed by an increase of crop of a more healthy character.

In large horticultural establishments at least it will certainly pay to sterilise all soil used, especially where nematodes or other root parasites exist.

The usual method of sterilisation of the soil is to build a large wooden bin about four feet wide, ten to fifteen feet long, and three feet deep, with one side hinged so that it can be let down to shovel out the soil. Iron pipes should be run along the bottom of the bin a foot apart, lengthwise. In a four feet bin there will thus be three pipes, each with one-sixteenth inch holes drilled in their side about one foot apart. Of course, the pipes must be connected outside the bin, and joined to the steam boiler, which can be done with a rubber pipe. Fill the bin loosely with soil, and place on the surface two or three potatoes. When these are cooked the soil has been sufficiently heated. Cover the whole with closely-fitting sacks or similar material to keep in the steam, the latter being turned on at about 80lb. pressure per square inch.

In some recent experiments on soil sterilisation at the Massachusetts Agricultural Station it was found that when the soil was heated to 180 degrees Fahr. it not only killed all eelworms, but penetrated and so destroyed the thick resisting cover of their eggs. J. J. Willis.

Harpenden.

Dracæna Sanderiana.—There are many dracænas suitable for room and other decorations, but for this purpose there is none to compare with D. Sanderiana, when grown three, four, or more plants together in a pot. They make very effective decorative specimens, and develop best when grown in a stove temperature until they reach the required size. Afterwards, with a little hardening by removal to a cooler house, they are fit for use as room plants. This hardening process, however, is not altogether necessary, as I have used many from the warm stoves, and placed them in cool rooms without the plants showing any ill-effects. This dracæna is what may be termed a "safe" plant for decorating, as the combination of colour will not clash with other shades, or offend the most fastidious tastes of those who have an eye for colour effect.—T. H. Slade.

NOTES ON SUMMER BEDDING.

At the time of writing, near the end of May, more or less severe frosts and bitterly cold winds are the order of almost each day, and no one will dream of commencing the work of bedding out until we experience a radical change in the weather. Anyhow, everything possible should be done so that the work may be carried out in an expeditious manner when the clerk of the weather assumes a sane mood.

Beds, borders, and all available space should be dug, manured if necessary, marked out, and labelled. It is advisable to add only a very small quantity of manure at this season, provided the ground received a fair share in autumn; at the same time, nothing but good can accrue from dressings of phosphates and superphosphate of lime, which should be spread over the surface and be dug in after the bulbs have been lifted and stored, or laid in in the reserve garden. There is but little danger of over-manuring the sites that are intended for foliage plants; but in speaking of flowering plants generally, when rich ground and a wet season go hand in hand, there is over-exuberance of growth and a paucity of flowers.

I venture to propose a few suggestions as to combinations of plants for flower beds, in the hope that they may prove of service to those who are strictly localised. A bed that struck me as being exceedingly effective in one of the London parks last season was composed of Antirrhinum Queen of the North, of spotless purity, and the new and exquisite annual Delphinium Blue Butterfly thinly disposed between them; while Viola Lilacina formed a capital framework. Those who have not seen Iceland poppies associated with tuberous begonias should experiment with one or more beds this season, and they cannot fail to be delighted with the result. These silken beauties lend lightness to the whole, and relieve the somewhat heavy appearance in both the foliage and flowers of begonias. For such beds violas appear happy as an edging, or a wide belt of Fuchsia Meteor may be employed. Groups of nine or a dozen Lobelia cardinalis Firefly, arranged on mounds (the mounds being separated from each other by three feet of space), and Antirrhinum Golden Queen doing duty between, with two rows of Royal Blue lobelia as edging, produces a very rich effect. Cockscombs and Viola Niphetos may be brought together, and here a viola of purple colouring may be used as a finish.

Gold and silver leaved abutilons with a few Perilla nankinensis interspersed, and Amaranthus melancholicus ruber outside provide a fine foil to flowering plants in its neighbourhood. Among foliage plants Iresine Lindeni and others are very effective when grown into specimens three feet in height, and they are well worth attention in this way. In a large bed I would recommend specimen plants of Fuchsia fulgens, Hibiscus rosea sinensis, Plumbago capensis, and Cassia corymbosa, with either verbenas or Phlox Drummondi as a carpet. Erythrina cristi-galli in large and strong plants, is both distinct and handsome, and a very fitting companion plant is found in the single blue aster, Callistephus sinensis. One need not dwell upon combinations of specimen fuchsias, ivy-leaf pelargoniums, streptosolons, heliotropes, Solanum jasminoides, etc., with dwarf plants as a carpet, as their merits are now both well known and recognised.

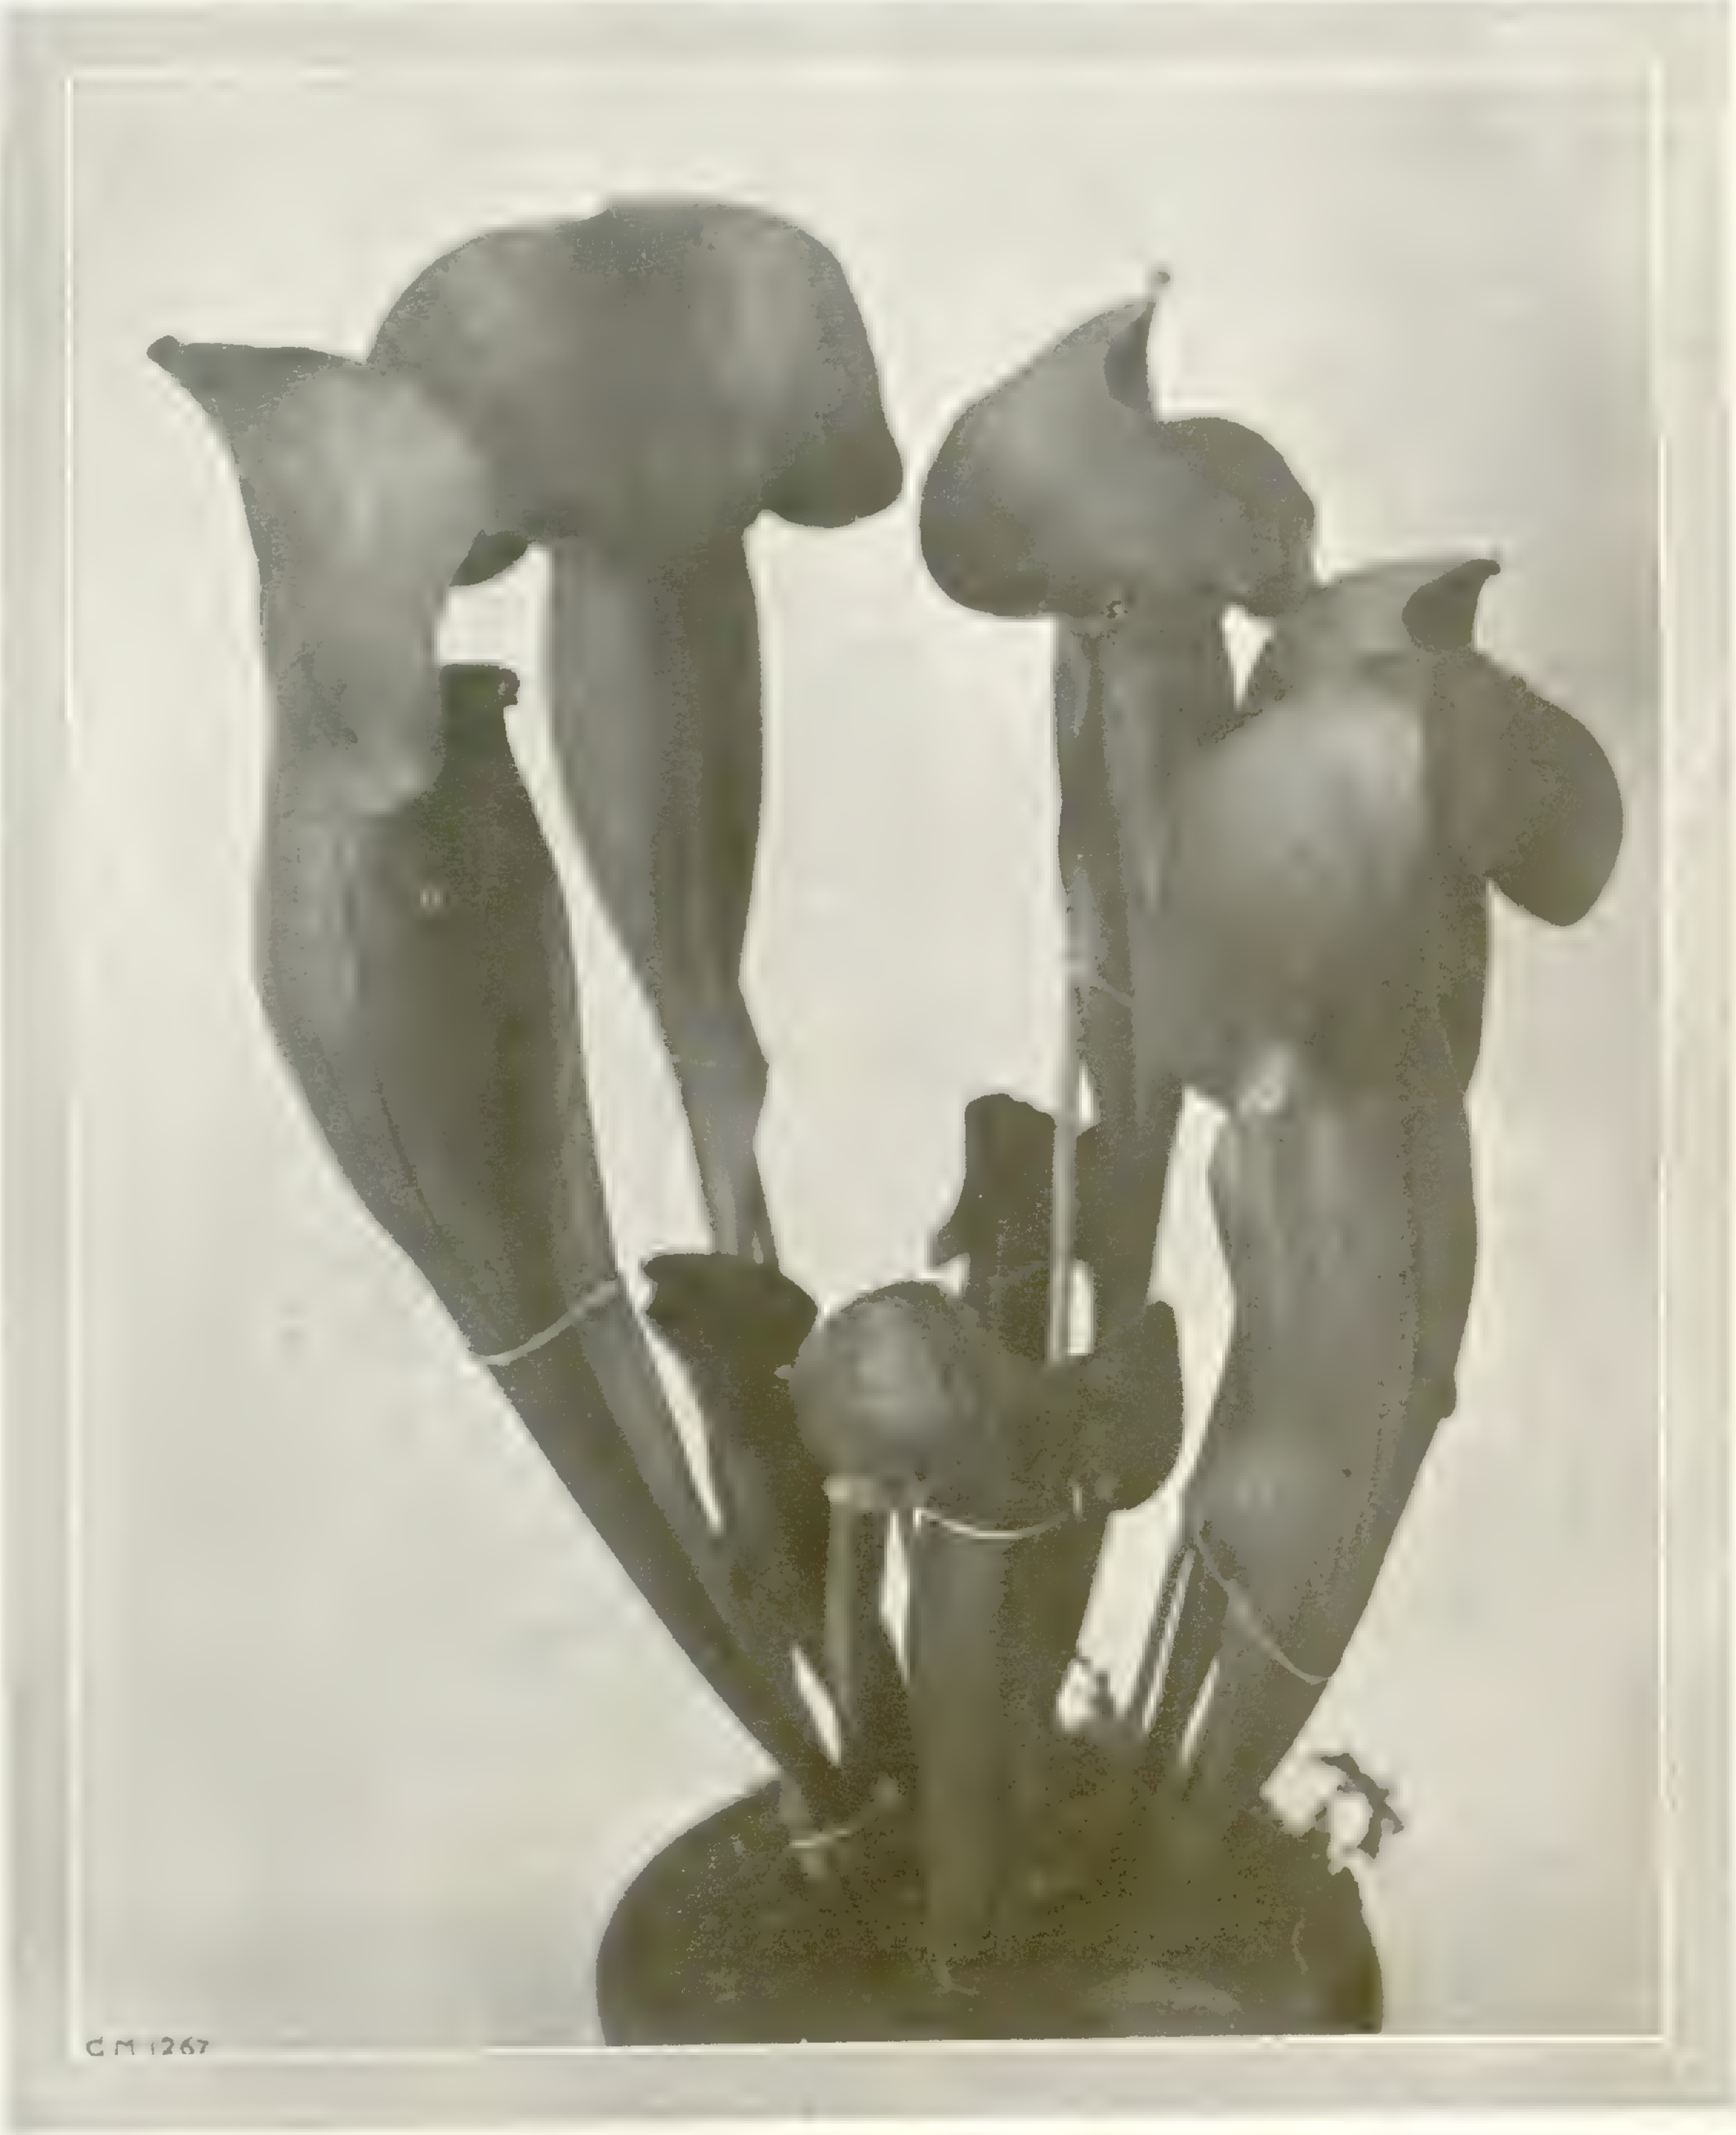
Walter H. Aggett.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

ONCIDIUMS.—There are few orchids that are more useful or effective for decorations and exhibition than the various summer-flowering species of oncidiums. One of the most beautiful and useful of the species is O. Marshallianum. Unfortunately, it has the habit of not being able to retain the vigour of the imported plants for many years in succession, and therefore needs replenishing from fresh importations about every alternate year. There can be no doubt that to the free-flowering characteristics of the species can be attributed its rapid decline in vigour.



TEMPLE SHOW—SARRACENIA WILLMOTTÆ.

A.M., R.H.S., May 24, Mr. A. J. Bruce, Chorlton-cum-Hardy. A fine new hybrid between S. purpurea and S. Stevensi. The pitchers are green, finely veined with purple and crimson.

The huge branching spikes of flowers take so much from the strength of the plants that it is rarely they withstand a flowering period without the bulbs showing signs of distress by shrivelling. With this fact before us, cultivators should see to it that the flower spikes are cut as soon as possible after they have become fully expanded, so that the excessive strain may be relieved at the earliest possible moment. It is a good plan to place the plants as soon as the flower scapes have been removed, in a cool, moist position in the odontoglossum house. This should be especially done where they have been taken out of the houses for exhibition purposes. There are many other kinds of oncidiums which are exceedingly useful when grown as specimens. There are few more serviceable for exhibition purposes than O. flexuosum. In our own immediate neighbourhood the pitmen grow this species admirably. It is not at all uncommon to see large specimens, in tubs, exhibited among the specimen stove and greenhouse plants they are so successful with.

SUMMER-FLOWERING ONCIDIUMS.—In the section of summer-flowering oncidiums to which O. macranthum, O. superbiens, O. lamelligerum, O. serratum, etc., belong, we have also useful exhibition and decorative subjects. The long flower scapes should be neatly trained around sticks, so that when the lateral racemes are produced they may display their flowers to the best advantage. Care must be taken to guard against the flower buds becoming attacked by greenfly or yellow thrips. Occasional vapourising and regular sprayings with some safe insecticide will effectually keep these pests in check. This section of oncidiums should have attention as soon as they pass out of flower, and any repotting necessary be done then. The young growths will in most cases have commenced producing their new roots before the plants come into flower. They are vigorous-rooting in most cases, and therefore ample root room should be given. Fill the pots to about one-half their depth with chopped bracken roots, and use a fairly coarse compost of fibrous peat, osmunda fibre, broken leaves, and chopped sphagnum moss, with sufficient broken crocks and sand added to render the compost porous. Keep them shaded, and maintain a humid atmosphere about them until the new roots have become established in the fresh material.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

CALADIUMS.—These are now about at their best, unless they were started very late; if still growing freely a little weak liquid cow manure may be given them, and this will help to keep them going for some little time to come. Where they are required for house decoration some of the most forward plants should be removed to a rather cooler house, and so hardened somewhat before they are introduced into the living rooms; if this is done a few days beforehand they will be found to stand pretty well for several days, but if they are likely to be wanted again it is as well not to leave them in the house too long. Under no circumstances should they be put in before being hardened, or they will flag within a few hours, and a good plant or plants will be spoiled for the rest of the season. Where the small growing varieties are in demand late in the season some of the smaller plants in thumbs or 60's should be moved on into large 60's or 48's before they become too root-bound, and if given a shady position in the stove or even in a cucumber or melon house, they will be found to grow well, and prove useful decorative plants for the table or rooms right on to the autumn.

HARDENING STOVE PLANTS.—As mentioned in the last calendar, stove plants at this season grow very fast, and it may be necessary to provide more room for many of the young plants. Where this is so it is a good plan to shift some of the older crotons, dracaenas, pandanus, phyllanthus, etc., out of the stove proper into a house where they may have a little cooler treatment for a time; from here they may do a good turn in the conservatory or winter garden, as a little later on the temperature in these places will hardly ever fall below 60 deg., so that the plants will keep in good condition for quite a long time, and thus do good service before being finally disposed of. This hardening process also applies to many ferns, which will make a nice change in the scheme of decoration in the house or conservatory during the very hot weather, and it is astonishing what a cool appearance they give to the rooms during the heat of the summer, and what a restful effect they produce after a long season of flowering plants. But it is only during the very warm weather they may be used without being injuriously affected by the change of conditions.

POINSETTIAS.—Early batches should now be rooted and ready for a shift. If rooted in thumbs then a large 60-sized pot will be the best for them, from which they may be transferred later into 32's, these latter being the most useful size for flowering the plants in. A fairly open compost should be used, such as one third each of loam, leaf-soil, and peat, with enough sand and charcoal to keep the whole porous. At this stage pot moderately firm, and place the plants in a fairly warm house or pit, where they may be kept close for a few days and be shaded till the roots begin to run freely, when they may be given more air and inured to the sun-light. It is not wise to let them grow too freely in the early part of the season, or they will become too tall to be useful before November or December arrive.

SEEDLING TORENIAS should be potted as they require it, and the earliest batch, which should be coming into bloom, ought to be removed to a rather drier house, in which the flowers will keep in a better condition, and if necessary they may be used in the conservatory or house.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

FRUITING QUEEN PINEAPPLES.—The fruits upon plants started early in the year as previously advised will be swelling well, but until they commence to ripen continue about once weekly to afford needful supplies of tepid water slightly enriched with manure. Maintain a moist atmosphere by damping as necessary between the plants, and by spraying the plants overhead when the house is closed for the day. Keep up a night temperature of 70 degrees, or slightly more, in mild weather; carefully ventilate the house early on bright days, and close it soon enough to entrap a temperature of 90 degrees, or a little higher, if it is desirable to advance the ripening. In order to prevent the crowns and the leaves being scalded by powerful sunshine, shade with thin tiffany blinds during the middle part of the day. Remove suckers, except those required for propagation purposes, at an early stage of growth. When the fruits commence to ripen keep the atmosphere tolerably dry, increase the ventilation of the house by day, and leave the ventilators slightly opened by night; discontinue watering the plants, and should too many fruits be ripening at one time remove some of them to a tolerably cool house in order to lengthen the supply. As soon as all the fruits are gathered give the plants liberal and painstaking treatment to enable them to develop sturdy suckers.

YOUNG QUEEN PINES that have made considerable root progress in their fruiting pots will demand an increase of root moisture and manurial assistance, but it should be remembered that few plants resent excessive supplies of water so much as the pine does (especially when green) before their pots are well filled with roots. Root growth will be accelerated by keeping the plunging material at a temperature of about 85 degrees, accompanied by other cultural details, such as advised for plants now swelling their fruits, the object being the attainment of sturdy plants. Remove all suckers as they appear.

CHARLOTTE ROTHSCHILD, SMOOTH CAYENNE, ETC.—Plants intended to afford next winter's supply of fruits will, in some cases, be completing their growth, and should at an early date be encouraged to push their fruits; if necessary this may be done by discreetly restricting the supply of both root and atmospheric moisture. In other respects ordinary details of management should be followed, always bearing in mind that the Smooth Cayenne is impatient of powerful sunshine. As soon as the plants raised in seven-inch pots in spring are sufficiently rooted shift them into their fruiting pots, twelve inches in diameter, or, if preferred, plant them in carefully prepared beds. In either case a compost of turfy light loam, relieved of fine particles, and mixed with a little soot and bonemeal, or a suitable artificial manure, should be used, and made firm by ramming. See that the balls of soil are fairly moist, and pull away a few of the bottom leaves before the plants are turned out of their pots, and in the case of potted plants lose no time in plunging the pots. When necessary lightly shade the plants, and carefully ventilate the house; keep the atmosphere moist, and spray the plants overhead in the morning, and again when the house is closed for the day, and above all things be careful not to over-water the plants.

EARLY PEACHES.—As soon as the trees, either in pots or planted out, are cleared of their fruit, give the roots a good watering with diluted liquid manure, and, if necessary, re-mulch the borders. Ventilate the house freely by day, and in a less degree by night, and when the wood has become firm, leave the ventilators fully open, and subsequently, in the case of pot trees, plunge the pots in a sheltered sunny position out of doors. With a view to assist the maturity of next year's fruit-bearing shoots thin out all useless wood, and in necessary cases rearrange that which is left. Keep root suckers carefully removed, and all leaves perfectly clean, and free from red spider, etc., by a thorough use of the syringe.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

BEETROOT.—The main crop will now require its final thinning—from nine to twelve inches apart. If the weather is dry the rows should be duly watered, and the finer particles of soil worked firmly around those plants that are left; in fact, it is much the better plan to carry along during the thinning process a receptacle filled with finely sifted old potting soil, as this will be found to give the young plants a good fillip. Keep a sharp lookout for small birds, which wantonly tear the young plants, and, as a preventive (which also proves very beneficial to the crop) give an occasional overhead dusting of a mixture of three parts sifted burnt rubbish and one of soot. Two light sowings of salt between the lines when the plants are six inches in height helps wonderfully.

RUNNER BEANS.—If the plants raised in pots and boxes are not already put out, lose no time in planting them in the prepared trenches, as previously advised; a foot apart will not be too much if the plants are strong. Plant in double lines, and well water in. To save any trouble from slugs place around each plant a quantity of finely sifted cinder ashes. Stake with very strong sticks, and spray the young plants regularly, particularly when in bloom, as this promotes a good "set" of beans. Sow a row in the open ground for succession, and make the final sowing the first week in July.

CELERY.—Continue to plant out the main crop as ready, well water in, and commence at once to give weekly sowings of soot and lime over the plants to prevent the celery fly from working, as it appears almost useless to scatter these after the maggot appears. An occasional spraying of quassia extract should be given where the fly makes regular visits.

COLEWORTS.—Make one sowing of these now, and another three weeks later, on a well-prepared seed bed, in drills; well soak the drills before sowing. Not half enough of this valuable winter cabbage is grown; it is of high quality, and of a hardy nature. The young plants from the first sowing can be planted on ground which will be cleared of early peas and potatoes without further preparation of the ground beyond a little treading and levelling. Plant at one foot apart, well water in, and at the first hoeing give a good dressing of wood ashes. Rosette colewort is a finely flavoured early variety, and Hardy Green is the best late or winter variety.

ENDIVE.—Make a small sowing for an early supply, and follow this at intervals of three weeks. When large enough to handle plant out in partially shaded ground and water and shade for a few days.

CAULIFLOWERS.—A little sowing of Walcheren and Magnum Bonum varieties made now will provide heads at a very opportune time.

EARLY BROCCOLI AND BRUSSELS SPROUTS must be planted out as soon as ready to succeed those already planted; if only a few rows of each are planted regularly there is no glut of sprouts at one time.

PEAS.—Make sowings in well-prepared trenches; Webbs' Masterpiece, The Gladstone, and Autocrat are excellent late varieties. Mulching must be attended to now the ground is getting warm, for maincrop peas, broad beans, cauliflowers, French beans, etc.—George Ellwood, Swanmore Park Gardens.

Clarkia elegans Firefly.—Of the innumerable annuals that contributed their share to the Temple Show none appealed more strongly to me than did this Clarkia, and for greenhouse decoration I know of nothing to surpass the delightful specimens that formed a part of Messrs. Sutton's magnificent group. The plants exhibited were a yard or more in height, their ascending branches being clothed throughout the greater part of their length with showy blossoms. Under the shade of the tent the exact colour was somewhat difficult to define, but the flowers appeared to be of a warm rosy-red hue, which, though harmonising well, was quite distinct from any of their associates. As hardy annuals the clarkias have of late years made considerable headway, their adaptability for cutting being a very desirable feature, but the better forms might well have greater attention bestowed upon them as subjects for the embellishment of the greenhouse at this season.—W. T.

BLETCHLEY & FENNY STRATFORD HORTICULTURAL SOCIETY.
BLETCHLEY PARK, BUCKS.
Charming and extensive grounds, one minute only from Bletchley Junction, L. and N.W. Rly.

FIRST ANNUAL SHOW,
AUGUST 1st, 1910, Bank Holiday.

LARGE SPECIAL PRIZES
for
ROSES, CARNATIONS, TABLE DECORATIONS,
etc., etc.

Schedules on application to Secretary,
THOS. BEST,
Bletchley.
May 28th, 1910.

[Page 5 of Schedule, Class 9. Carnations, should read "Eighteen" Vases, not "Eight" Vases.]

RICHMOND HORTICULTURAL SOCIETY
The 36th ANNUAL SHOW
Will be Held in the
OLD DEER PARK, RICHMOND, SURREY,
On WEDNESDAY, June 29th.
Silver Challenge Cups. Gold and Silver Medals.
Valuable Money Prizes.
Entries close June 22nd.
W. J. COOK, Hon. Sec., Holmsley House, Richmond, Surrey.

WOLVERHAMPTON GREAT FLORAL FETE,
July 12, 13, and 14, 1910.
£900 IN PRIZES.
Schedules on application to the Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Gardeners' Orphan Fund.

Although there were some vacant seats, the attendance was good at the annual festival dinner of the Royal Gardeners' Orphan Fund held at the Hotel Cecil, on Thursday, May 26, under the genial presidency of Sir Jeremiah Colman, Bart. The chairman was supported by Messrs. N. N. Sherwood, Edward Sherwood, H. J. Veitch, W. Atkinson, Edward White, G. J. Ingram, J. Douglas, H. B. May, W. Poupart, J. F. McLeod, D. Thomson, G. Monro, E. Rochford, P. R. Barr, W. Cutbush, T. W. Sanders, W. Bates, [illegible] Alderson, W. Thompson, A. Allan, T. Bevan, J. H. Witty, James Walker, D. Ingamells, H. L. Wright, R. H. Pearson, R. F. Felton, C. Dixon, and many other well-known horticulturists.

The tables were splendidly decorated with [illegible], carnations, anthuriums, orchids, ferns, etc., while pillar roses, liliums, palms, etc., were used in the room, and a few elegant pillar roses, Coquina and Lady Gay, were used on the top table.

In a very loyal, pleasantly worded, and sympathetic manner, the Chairman proposed "The King" and also "Her Majesty Queen Mary, Alexandra—the Queen Mother (our patron), Edward Duke of Cornwall, and the other Members of the Royal Family." For many of those present the loyal toasts had a sad meaning and were honoured for the first time since the death of King Edward. They were honoured in a very loyal manner and with deep heartiness.

Sir Jeremiah Colman had a fine reception when he rose to propose "The Royal Gardeners' Orphan Fund." He said that facts and figures were not the most digestible things, and not very suitable for an after-dinner speech, and so he proposed to avoid them as far as possible, especially as the treasurer, Mr. Edward Sherwood, would presently have to deal with figures. He ventured, however, to remind those present that the fund had one hundred and twenty-seven children under its care, and that during the year 1909 the sum of £1,716 had been expended upon the maintenance of orphans of gardeners. This showed that the fund was doing a great work in an unpretentious manner. It proved that the management was economical and to the great advantage of those whom it was intended to benefit. The fund was, therefore, fully deserving of the utmost support. That the science and art of gardening has advanced greatly during recent years was amply demonstrated at the great Temple Show just concluded; and with its advance came the need for an advanced type of gardener, one who would accommodate himself to the wishes of his employers, and not, as in the case of some old-fashioned gardeners, look upon the garden as his own property, and grow what he himself thought fit. No recreation, said the Chairman, was more delightful than that of gardening, as it appealed to the senses of sight, smell, and taste. As one who spent a good deal of his time in life's commercial battle he found nothing more soothing after a busy time than the rest and recreation the garden afforded, and for this recreation one had very largely to depend upon the gardener for the amount of enjoyment obtained. Gardeners deserved all the help they needed, but he thought they might take a little more interest than they at present did in a fund founded and worked for their general benefit. Many appeals were made nowadays in the name of charity, but he hoped there was still a warm corner in the hearts of those present for the Orphan Fund. The height of practical religion was "to visit the sick and the fatherless," and he therefore appealed to all lovers of gardens to make the festival one of the best on record, to give liberally, and so enable the good work to be continued.

Mr. Edward Sherwood, treasurer of the fund, very ably responded to the toast, and thanked Sir Jeremiah Colman for his presence and his admirable and sympathetic speech on behalf of the fund, and for the kindly letter he had circulated on behalf of the festival. He hoped there would be a large response to the chairman's appeal, and that the fund would not suffer because of the sadness and sorrow of the past three weeks. He was the more anxious because for the first time the receipts had not been sufficient to meet the expenditure. The need of funds was great because 127 children were being provided for, and grants were being made to fifteen selected candidates already awaiting election. The amounts received in 1909 fell short of 1908 by about 63 guineas; 1908 was the coming of age year and the response to appeals was so ready that perhaps the committee, having the funds in hand, had placed more children on the funds than they should have done. But, said Mr. Sherwood, they looked forward to more substantial funds to continue the good work. He believed the late Baron Sir Henry Schröder had bequeathed £500 to the fund, and if so this sum would be invested and provide in perpetuity for one orphan in memory of "the Baron." He desired to bring before them one instance of the fund's operations. Not long since the wife of a gardener named Bailey, at Chertsey, gave birth to a child and very shortly afterwards her husband died, and the following day she died also. The eldest child was a lad of fourteen, and the youngest a tiny baby. Four children were taken care of by local charitable institutions, the baby was adopted by a Chertsey lady, one child was awaiting election upon the Gardeners' Orphan Fund, and the lad of fourteen had been received in the School of Handicrafts, at Chertsey, on condition that the Orphan Fund contributed 5s. per week until he was sixteen years of age. The committee had accepted this further responsibility, and therefore begged for a hearty response to the appeals for funds to carry on its work. Mr. E. Sherwood suggested the formation of more auxiliaries, so that gardeners might co-operate, contributing a penny or more per week to the local secretary, and he believed that in this way a great deal could be done. The fund did not exist for the benefit of gardeners round London, but was a national institution, and therefore deserved national assistance.

Mr. C. Armstrong proposed "Gardeners and Gardening" in a pleasant little speech, and Mr. Harry J. Veitch responded, and congratulated Sir Jeremiah Colman upon the splendid exhibit of orchids he had made at the Temple Show, and upon his success in winning the Sherwood Cup. Mr. Veitch also referred to the forthcoming International Horticultural Exhibition to be held in 1912, and expressed a hope that all would work to make that exhibition worthy of those who had done so much in the past to bring horticulture to its present proud position.

Mr. N. N. Sherwood proposed "The Visitors," and in doing so welcomed those present for the first time, and expressed a hope that they would come again, and would also contribute liberally to the fund. The beautiful decorations would remind them of the calling of the majority present, while the aim of the gathering was the assistance of a deserving charity. He was glad to find that the Worshipful Company of Gardeners had contributed to the two great gardening charities, and he hoped the time would come when its funds would permit it to provide for one orphan entirely. Mr. Ebblewhite, clerk to the Gardeners' Company, responded, and said his company hoped to do more in the future, and, among other things, to help make the great exhibition of 1912 a success.

At this point Mr. Brian Wynne, the secretary of the Fund, gave the list of donations, the list included £250 from the chairman, £100 from Mr. N. N. Sherwood and his sons, Mr. W. and Mr. E. Sherwood; Mr. G. H. Cuthbert, £52 10s.; Mr. L. Sutton, £50; Sir Frank Crisp, £27 12s.; Messrs. de Rothschild, 25 guineas; Mr. Anthony Waterer, £25; Mr. J. F. McLeod, 26 guineas; Mr. G. Reynolds, £37 12s. 6d.; Mr. R. Hooper Pearson, £13, Mr. Nutting, £16 5s. 6d.; Mr. Leak, 13 guineas; Mr. D. Thomson, £13 8s.; Mr. J. C. Eno, 10 guineas; Messrs. Barr and Sons, 10 guineas; Mr. W. Howe, 7 guineas; Mr. T. W. Sanders, 7 guineas; Mr. J. Douglas, 7 guineas; Mr. E. White, £5; Mr. H. J. Veitch, 5 guineas; Messrs. J. Veitch and Sons, 5 guineas, etc., etc. The Covent Garden friends excelled themselves, the lists from Mr. D. Ingamells (£105), Mr. H. L. Wright (£71 8s. 6d.), and Mr. W. Poupart (£35 10s.), making a total of £211 18s. 6d. from the market men. Rounds of applause greeted the notification of the chairman's handsome donation and the fine response of Covent Garden, and there was great joy when Mr. Wynne gave out the grand total as £1,134 3s. 4d.—the second highest amount obtained at a festival dinner.

[Just as we go to press we learn from Mr. Wynne that other items received bring the total up to £1,160—this constituting a record sum for a festival dinner.—Ed., G.M.]

Mr. H. B. May, chairman of Committee, proposed the health of "The Chairman," and briefly referred to Sir Jeremiah Colman's long and close connection with horticulture, and his success at the Temple Show. He called attention once more to the case of the Bailey family for the purpose of suggesting the formation of an Emergency Fund that would enable the committee to deal with cases that did not quite come within the purview of the rules of the fund. Mr. May congratulated Sir Jeremiah on the success of the festival, and heartily thanked him for his kind and generous help. The toast was heartily received, and accorded musical honours. Sir Jeremiah Colman briefly responded, and thanked all those who had done so much to make the meeting a success. He referred to Messrs. Veitch, Rochford, Barr, Low, Felton, and others, through whose kindness the tables and hall were so charmingly decorated. After a kindly word of recognition of Mr. B. Wynne's services, the meeting closed with "Auld Lang Syne."

The musical arrangements, under the able direction of Mr. Turle Lee, were excellent, and the songs by Miss Violet Oppenshaw were particularly well rendered.

Royal Scottish Arboricultural Society (Aberdeen Branch).

The quarterly meeting of this society was held in the Aberdeen University Buildings, Mr. Sydney J. Gammell, of Drumtochty, president, in the chair.

The Secretary (Mr. George D. Massie, solicitor, Aberdeen), intimated the addition of a large number of new members among whom were Lord Leith of Fyvie, Sir John Macpherson-Grant (of Ballindalloch), Mr. Ogston (of Ardoe), Mr. William Irvine Fortescue (of Kingcausie), Colonel Ogston (of Kildrummy), and Mr. J. P. Robertson White, advocate, Aberdeen.

PRUNING FOREST TREES.

Mr. C. S. France, Aberdeen, then read a paper on "Practical Forestry, with Special Reference to the Pruning of Forest Trees." Mr. France commenced by referring to the importance of practical knowledge being added to theoretical knowledge in regard to forestry. The tendency at the present time, he said, was to consider the higher and more scientific aspects of the question to the neglect of the practical. It was only this combination, however, that would enable foresters to produce the best results in the cultivation of the different classes of trees grown. One of the most important practical questions with which the lecturer dealt at some length was that of pruning. He referred to the effect of pruning on the broad-leaved or hard wood trees, and emphasised the necessity of pruning being done, wherever it was required, in the early stages of the growth of the tree. He advocated that this pruning should be done in such a way as to enable the wound caused by the pruning to be healed within twelve months. The cutting of large branches, necessitating the use of a saw, was at all times to be deprecated. Cases arose, however, where that rule might have to be departed from to prevent branches unduly contending with the upward tendency of the leader. In such cases the wound ought to be specially treated, and as few branches as possible ought to be cut off. If pruning were done at the earlier stages, the necessity would not be so apt to arise later on for cutting off larger branches. With regard to fir trees, no pruning at all ought to be done, or as little as possible, because these trees were growing in close plantation, and were intended to be grown thus closely together, and Nature would regulate the layers of the branches of the trees. The lecturer was strongly of opinion that in young plantations where a number of dead branches were to be found on trees, it was conducive to the ultimate production of good, straight-grained, and clean timber, or rather timber clean from knots, that those dead branches should be cut off as soon as they appeared, and as close to the stem as possible, so that the succeeding longitudinal layers would be laid on in such a way that the grain of the timber would be uniform. As to conifers planted for ornamental purposes, they required little pruning, because all trees grown merely for the sake of ornamentation ought to be allowed to take their natural course.

NATURAL INCREMENT OF LARCH AND NORWAY SPRUCE.

Mr. John Rule, forester to the Duke of Richmond and Gordon, Gordon Castle, then submitted a few notes on "The Natural Increment to be expected from a crop of larch and Norway spruce in decades from fifty to seventy years." He described his experiences in connection with larch-growing near the top part of the Bin Hill Woods on the Huntly (Aberdeenshire) portion of the Gordon-Richmond estates, the elevation here being about 750 feet above sea level. Until a few years ago, Mr. Rule said, this wood was surrounded by a continuation of the same forest, and, for that reason, the trees were all straight and well-grown up to the top of the hill. The crop was of pure larch, with the exception of a very small sprinkling of Scots fir and spruce. Taking an average of fourteen to fifteen acres, the number of larch was found to work out at 166 trees to the acre. The large-sized timber trees were 75 feet in length to the top shoot, and measured up to five inches in diameter. The plantation was formed during the years from 1839 to 1841, and over the area mentioned very little cutting had been done for the last thirty years, so it could safely be set down as having remained very much the same as to the number of the trees during the two decades from fifty to seventy years of age. Mr. Rule estimated the contents of timber per acre twenty years ago, when the trees were fifty years of age, at 1,428 cubic feet. Ten years ago, when the trees had grown for sixty years, the estimated cubic contents were set down at 2,078 feet, and at the present time, at seventy years, the wood contained 2,676 cubic feet of timber per acre. With regard to spruce, which, planted at the same time, yielded 140 trees per acre, the cubic contents per acre at fifty years' growth, was 2,240 feet. One hundred spruce trees at sixty years of age—forty less per acre being allowed for trees which, it is assumed, may have been taken away or destroyed—were estimated to yield 2,500 cubic feet of timber; and a similar number at seventy years of age 2,800 cubic feet.

Discussion followed upon the papers. Mr. John D. Crozier, forester to Mr. Baird of Durris, near Aberdeen, deprecated the removal of branches from trees in close plantation, and even the disturbance of the humus created by the removal of these branches and leaves from the ground, contending that the humus formed the natural food of the trees, and that its removal or disturbance could not be good for the trees.

The Chairman referred to the practice followed in Bavarian forests, and pointed out that authorities had strongly deprecated the removal of humus from underneath the trees.

Mr. France and Mr. Rule were warmly thanked for their papers, and a similar compliment having been paid the chairman, a very pleasant meeting terminated.

British Gardeners' Association.

The sixth annual meeting was held at Carr's Restaurant, Strand, W.C., on Wednesday, May 25, Mr. John H. Witty, vice-chairman of the Executive Council, in the chair. The minutes of the previous annual general meeting having been read and confirmed, Mr. Hawes moved a vote of condolence and sympathy with the King and Royal Family, on the death of his Majesty King Edward VII. Mr. Thos. Bevan seconded, and the vote was passed in silence with the members upstanding.

In moving the adoption of the annual report, the Chairman referred to the sure and steady progress that had been made by the association. There were now about 1,900 members, and there were signs of quicker progress during the past twelve months. The monthly journal of the association was well edited by the secretary, and published with great regularity. It was doing great work in spreading information of a useful character amongst the gardeners of the United Kingdom, and it was now paying its way. In regard to the badges, he would like to see every gardener wearing one as a mark to distinguish the intelligent members of the gardening craft. So far as the financial position of the British Gardeners' Association was concerned, there was a larger balance than ever to its credit, although the expenses were heavier than usual. The work of the association was growing enormously, and entailed an increasing amount of labour upon their secretary.

Mr. Wrigglesworth, of Sunderland, seconded the adoption of the report in an eloquent speech. Practically no discussion took place upon the report, which, upon being put to the meeting, was carried unanimously.

A discussion arose, however, on the question of giving an honorarium to branch secretaries, and many members took part in it. The general opinion was against the payment of branch secretaries out of the general funds, but there was no objection to the members of any branch recognising the services of their secretary, and the Executive Council would be pleased to help. Mr. Raffill was elected treasurer, Mr. J. Weathers secretary, and Messrs. Tinley and Cowley auditors. Votes of thanks to the gardening Press and the chairman concluded the proceedings.

(LONDON BRANCH.)

The second annual meeting of the above branch took place at Carr's Restaurant, Mr. E. F. Hawes in the chair.

In formally opening the meeting the Chairman sympathetically alluded to the great national bereavement caused by the death of His Majesty King Edward VII.

The annual report was next read. This dealt principally with the work of the branch during the past twelve months. Nine meetings were held at Carr's, the average attendance being fifty. At each meeting the business of the branch had been dealt with, followed by a lecture upon some subject of horticultural interest. Three excursions to places of interest were conducted during the summer, the places visited being Aldenham House, Messrs. Jas. Veitch's nursery at Coombe Wood, and Battersea Park. Two concerts were held by the branch, and these proved very successful and were the means of considerably augmenting the finances. Fourteen new members joined, bringing the total membership up to 185.

The committee desire to thank all those who have so generously assisted in the work of the branch during the year, and to express their appreciation of the liberal manner in which the Horticultural Press has given prominence to the reports and notices of the branch. In moving the adoption of the annual report and balance-sheet, the Chairman congratulated the members upon the progress made, and upon the satisfactory financial condition of the branch. This was seconded by Mr. Winter, who endorsed the chairman's remarks.

The next business dealt with was the election of officers for the coming year. Members heard with regret that it was the intention of Mr. Hawes not to accept the post of chairman, which he has so ably filled since the formation of the branch; after considerable discussion Mr. North was appointed chairman, with Mr. A. G. Barnes as vice-chairman. Five new members were appointed on the committee, and Mr. A. G. Barnes and Mr. V. Cockram were re-elected as treasurer and secretary respectively.

Mr. Feltham then gave an address upon "The Policy of the B.G.A.," which was listened to with interest, and brought forth an equally interesting discussion, taken part in by Messrs. J. Weathers, G. Hemming, T. Winter, and J. Frogbook. A vote of thanks to Mr. Feltham terminated the meeting.

Croydon Gardeners' Society.

Mr. R. B. Leech, Wood Hall Gardens, Dulwich, continued his lecture on "Syringing and Damping Down Greenhouses" before the members of this society a few days ago. The second part of his lecture was confined to the practical side of his subject, and in giving his methods of growing plants in the various greenhouses which come under the gardener's charge. His first lecture was devoted to the theory of this important work, so that the members were well acquainted with the reason why the subject is deserving such close study.

The vineries were the first houses dealt with, and perhaps here the lecturer was inviting the most opposition from his audience, for he deprecated the use of the syringe entirely and only an occasional damping down on the floors. In his experiments during several years he had entirely satisfied himself that providing the roots were well watered and a slight evaporation going on in the troughs over the pipes this was all the moisture required. By this means he had obtained more fruit, of better colour and flavour, and the grapes had kept much better when cut.

NATIVE GUANO
BEST and CHEAPEST MANURE for VEGETABLES, FRUITS and FLOWERS.

Price **£3 10s.** per ton in bags. Lots under 10 cwt. **4s.** per cwt. at works; or **5s.** per cwt., carriage paid to any station in England.

Extracts from 32nd annual collection of reports:—
NATIVE GUANO for POTATOES, VEGETABLES, etc.
J. HAYDON, Hampton: "Potatoes, excellent crop; none diseased. Grand for keeping away slugs."
G. PERRY, Westcliffe: "Peas and onions splendid."

NATIVE GUANO for FRUIT, ROSES, TOMATOES, etc.
A. W. BRINKHAM, Hull: "Cucumbers, tomatoes, and chrysanthemums highly satisfactory." G. APPLETON, Carlisle: "Finest manure ever used for vines, peaches, roses, carnations, etc." W. COOPER, Shoeburyness: "Most excellent for roses."

Orders to the **NATIVE GUANO CO., LIMITED,** 29, New Bridge Street, London, E.C., where 32nd year's testimonials, etc., may be obtained. Agents Wanted.

ment he had found the results just as satisfactory as when continually syringing, and, of course, withholding the syringe meant lessening labour. Strawberries were treated in a similar manner and with better results than a continual damping of the foliage would produce. In cucumber growing the aim is to get fleshy and crisp fruit, so that the use of the syringe and plenty of moisture in the air would be well advised.

Foliage plants, such as caladiums, marantas, anthuriums, and dracænas, he had found to do much better in a buoyant atmosphere than when the house was full of vapour, so that the use of the syringe was not needed when growing them.

Coming to cooler houses, such as those where roses and carnations are grown, he would not think of using the syringe or wetting the foliage in any way, for in the case of roses this continuous moisture accounted to a large extent for mildew. For ferns, too, he advised what he termed the dry system, as the foliage would then be found more leathery and better able to stand removals to dwelling rooms than where succulent growth is obtained by so much moisture. Orchids came under similar treatment, and his results quite justified his remarks.

When speaking of the various plants mentioned he exhibited foliage of each, and the healthy appearance it had helped to convince the most sceptical of the truthfulness of his statements.

Mr. Leech hoped to create a discussion, and perhaps opposition to his methods, but his audience being well acquainted with him and knowing his reputation as a grower, they accepted his advice, and his remarks will no doubt be carefully studied and applied.

The Chairman, Mr. G. H. Dyke, in conveying the hearty thanks of the meeting to Mr. Leech, expressed the extreme gratification all felt for the admirable manner in which he had treated the subject on these two consecutive occasions.

Dundee Horticultural Association.

The University College, Dundee, was the rendezvous of the members of this association on the afternoon of May 21, and in the College gardens Professor Geddes, F.R.S.E., gave many little lecturettes in going round the beds of natural orders and interesting groups of plants. After inspecting the Botanical department in the College, and being refreshed with tea thoughtfully provided by the Professor, numerous microscopic slides were laid out (showing the structure of plants and flowers) for the enlightenment of the company.

Before leaving, Mr. Wm. Christmas voiced the thanks of the company to Professor Geddes for his kind attention, information, and hospitality. The Professor, in reply, said that the friendship between the scientist and the practical man was not what it ought to be, considering their relationship. He hoped that in future they would visit the College oftener and at various seasons when they might find more varied interests, and always a hearty welcome from either Mr. Watson, the gardener, or himself.

Bristol Gardeners' Association.

The first meeting of the new session was held on May 26, at St. John's Parish Rooms, when Mr. Hayball presided over a good attendance. Mr. Shrivell, of Tonbridge, Kent, gave an interesting lecture upon "Manures for Kitchen and Market Gardens." Mr. Shrivell, in conjunction with Dr. Bernard Dyer, has been conducting experiments on his farm, having twelve acres devoted entirely to this work. These experiments have been carried on for sixteen years, with the chief object of finding the cheapest way to grow vegetables. The following crops were dealt with by Mr. Shrivell: asparagus, beetroot, broccoli, celery, onions, and potatoes, also fruit trees, herbaceous plants, and lawns. Fifty tons of London manure to an acre of asparagus produced 922 bundles of $17\frac{1}{4}$ oz. each, but twenty-five tons of manure and 4 cwt. each of nitrate of soda and superphosphate per acre produced 1,254 bundles of 21 oz. each. Similar results were obtained with all other vegetables, plainly proving that nitrate and superphospate, used with farmyard manure, give far better results than manure alone.

A hearty vote of thanks to Mr. Shrivell was given at the close. For three spring cabbages, Mr. Young was first; Mr. Lee second. Three new members were elected.

Broughty Ferry Horticultural Association.

The usual monthly meeting was held recently under the presidency of Mr. James Bethel, when Mr. Wm. Gilchrist, Head Forester, Mount Melville, St. Andrew's, gave an admirable practical address on "Ornamental Trees for Parks, Pleasure Grounds, and Hedgerows." There was a bright and interesting display of exhibits from Roseby Gardens, Arbroath, and The Grange Gardens, Mansfield, as well as a competition for pots of schizanthus for which the president was awarded 1st, Mr. John Bell, Corona Gardens, 2nd, and Mr. D. Eggo 3rd.

OBITUARY.

Messrs. R. P. Ker and Sons, Basnett Street, Liverpool, and Aigburth Nurseries, Grassendale, Liverpool, write: "We regret having to announce the death after a prolonged illness of our senior partner, Mr. Robert Wilson Ker, who passed away at his residence, 72, Upper Parliament Street, on May 3. We have also to acknowledge with sincere thanks the many kind expressions of sympathy received by the firm testifying to the regard and high esteem in which the deceased was held.

"The business, as nurserymen and seed merchants, will be conducted as heretofore, under the same title as founded by the father of the late Mr. Robert Wilson Ker."

FORTHCOMING ENGAGEMENTS.

TUESDAY, June 7.—Royal Horticultural Society; Committee meet at 12 o'clock; lecture at 3 p.m. on "Survivals Among Plants of the Past," by Rev. Prof. G. Henslow, M.A., V.M.H.; Scientific Committee at 4 o'clock.

WEDNESDAY, June 8.—East Anglian Horticultural Society.

Royal Society of Arts.

Birmingham Summer Show.

THURSDAY, June 9.—British Gardeners' Association (London Branch) Excursion.

SATURDAY, June 11.—R.H.S. Gardens Club; Annual meeting at Wisley Gardens.

MONDAY, June 13.—United Horticultural Benefit and Provident Society.

WEDNESDAY, June 15.—York Floral Fete and Gala, three days.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

DISEASED PEACHES.—W. C. F., Renfrew: Will you please send us further specimens as soon as possible.

DAMAGED GRAPES.—B., Wimborne: Scalding is the cause of the damage to the berries sent, and due, as no doubt you are well aware, to the burning action of sunlight through the globules of condensed moisture on the berries. The remedy is ventilation very early in the morning so that the moisture is dispelled before the sun is powerful enough to cause scalding.

LILAC.—S. E. T., Cambridge: Cut the bushes back to a point where there are several strong young growths; thin out a good deal of the poor wood towards the base, and then encourage the remaining growths by mulching the bushes with half-decayed manure and watering them freely in hot weather. Growths so encouraged should yield fine panicles of flower next year provided the position of the lilacs is a good one. Where lilacs are starved by strong-growing trees and shrubs near them, or are in a shaded position, they do not flower well. An open position, good feeding, and thinning are necessary for the production of large panicles of bloom.

WRITING ON ZINC LABELS.—L. M. E., Winchester: If bi-chloride of platinum is used for writing the names of plants on zinc labels the name will remain legible for a very long period.

LILY OF THE VALLEY.—S. E. T., Cambridge: Early next year, in February or March, when the weather permits, dig up one of the beds of lily of the valley and sort out the individual crowns. Reject all small crowns and cut away any dead portions; then, having made a new bed in which leaf mould has been freely used, plant the crowns singly and regularly four inches apart. The points of the crowns should be two inches below the surface of the soil. A good watering is usually desirable, following this with an inch-deep mulching composed of equal proportions of leaf-soil and old mushroom bed or old-hotbed manure. Every necessary attention in the matter of watering must be given during the summer, and each autumn, after the leaves have died down, give the bed a mulching of very old manure and leaf soil.

SHADING FOR PLANT HOUSES.—M. E. J., Shepton.—In practically every case blinds are much to be preferred to a wash or permanent shading for plant houses, but where there are difficulties in the way of blinds one or other of the advertised materials may well be employed, as these are well prepared and very suitable. A very good green shade is prepared from Brunswick green and skim milk. There are two shades of Brunswick green, and to obtain the desired tint mix them together at the rate of one pound of the light shade to half a pound of the dark shade. To the mixture add sufficient skim milk to reduce it to the consistency of thin paint. Add the milk gradually as the stirring proceeds, otherwise there is a difficulty in mixing it. Apply it with a medium-sized painter's brush, when the glass is dry. Another very excellent light wash is prepared with newly-slaked lime, whitening, and skim milk. The whitening and lime

WOOD GARDEN HUTS

for use as Tool-sheds, Workshops, Potting Sheds, Play-rooms, Cycle Houses, Motor-car Houses, etc., etc. Strongly built of selected materials by skilled workmen. Made in sections for easy erection and removal by local workmen. Painted and finished throughout in a superior manner.

are mixed together in equal proportions, and enough milk is, as in the case of the green mixture, added to make it of the consistency of paint. Apply lightly and in fine weather, so that it may become dry before exposure to rains. These washes are easily removed in the autumn. Always brush the glass down with a soft dry brush before applying the shading material.

TO DEMOLISH TREE STUMPS.—J. C., Gourock: If the stumps are fresh and still sappy bore one or more holes, two inches in diameter, vertically into them, one of these being right in the centre of the stump. Put two ounces of saltpetre into each hole, fill up nearly to the top with water, and drive in a wooden plug. The holes should be about eighteen inches deep. Late in the coming winter remove the plugs, pour a quarter of a pint of paraffin into each hole, cover with a little straw or brushwood, and set fire to the latter. The stumps will smoulder away without flaming much, and soon be reduced to ashes. This method only holds good when the stumps are fresh and sappy, as the saltpetre then permeates the whole of the mass, and the fire follows after the saltpetre. In the case of dead stumps a good plan is to pour a pint of paraffin over the stump each day for two or three successive days, and then set fire to a small pile of dry refuse wood placed over the stump; if an old sheet-iron chimney or cylinder is available and is placed over such a fire then a strong draught may be produced, and the stump will be more quickly demolished.

PERPETUAL STRAWBERRIES.—F. C. W., Mundesley: During a considerable period some of the French raisers endeavoured to combine the more or less perpetual-fruiting habit of the alpine strawberry with the free-cropping and large-fruited kinds. Little success attended their efforts until about a dozen years ago the Abbé Thivolet of Chenoves was fortunate enough to obtain several perpetual varieties of the desired nature. The first of these was St. Joseph, which continued to flower and fruit from May until October, and though its fruits were not of first-rate flavour they were passable and of fair size. This was followed by the variety named St. Antoine de Padoue, which was an improvement on the St. Joseph, being more perpetual, larger fruited, and of fair flavour. For some time these varieties found a great deal of favour, but they are not much heard of nowadays. Possibly if raisers had continued their efforts the race would have been so improved as to be of considerable commercial value.

QUASSIA SOLUTION.—M. O. R., Wisbech: Soak half a pound of quassia chips in two gallons of water all night and then bring the whole to the boil and keep boiling for at least ten minutes. Strain the liquor, and while it is still hot add half a pound of soft soap. Plants infested with fly should be syringed with the mixture while still warm, and be syringed with clear tepid water about half an hour later.

NAMES OF PLANTS.

J. M., Yorks.—Funkia ovata.

J. M., Yorks.—Specimens insufficient for determination; probably No. 1 is Agathæa cœlestis, and No. 2, Celsia cretica.

T. A., Guildford.—1, Phlox canadensis; 2, Primula farinosa; 3, Cytisus albus; 4, Daphne cneorum; 5, Rhus typhinus; 6, Oncidium pubes.

E. C. C. D., Tunbridge Wells.—The flowering plant is a rubus, probably Rubus deliciosus: the other specimen is a cut-leaved lime, Tilia platyphyllos aspleniifolia.

D. H., Caterham.—1, Asplenium Nidus; 2, Dracaena congesta; 3, Trachycarpus excelsa; 4, Ophiopogon Jaburan variegatus; 5, Polypodium aureum; 6, Bambusa variegata.

S. R., Brandon.—The fringed tulip is one of the Parrot or Dragon varieties, but we cannot give you the varietal names of either specimen. Only in the case of very popular and well-marked florists' flowers is it safe to name a specimen unless one has access to a large collection of varieties.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

British Ferns.

The recently-awakened popular interest in the beautiful varietal forms of our native ferns undoubtedly justifies a short note of their merits. Half a century ago the discovery by a few pioneer fern hunters of some strikingly beautiful "sports." under wild conditions, and the introduction of these to popular notice, led to a "craze" in that direction, which unhappily induced the trade growers to place upon the market a large number of inferior and defective forms. These at first found a ready market as "curios," but eventually not only entirely swamped the comparatively few symmetrical and beautiful varieties then discovered, but also, as was inevitable, led to a reaction, which until the last year or two has thrown our native ferns entirely into the background. In the interim, however, a continuous coterie of enthusiasts not only maintained their collections, but by dint of persistent search in our ferny lanes, hedgerows, glens, and moorlands, discovered many more charming departures from the normal. These they not only propagated by offsets and bulbils, when such were developed, but also by their spores; and as it is a peculiarity of "sports," as a rule, to breed not only fairly true, but also to produce offspring of enhanced character, the result has been the acquisition of so large a number of fine symmetrical and constantly beautiful forms, that the merely "curious" have become quite ignored. At the present day we have as a consequence a series of purely native ferns with which no other country, or, indeed, all other countries put together, can vie, as regards intrinsic beauty and variety of type. It is this latter feature which is perhaps the most interesting. Exotic species, as we know, also are apt to sport, and many beautiful aberrant forms adorn our conservatories and decorate our rooms; but in the British forms we have quite a number which have sported in a fashion of which no parallels have occurred among the exotics. It is only recently, indeed, in the wonderful strains of Nephrolepis exaltata, which have been developed by bud sports from the first American introductions, that we have found rivals to some of our finest forms of Shield Ferns raised more than a quarter of a century ago, while every now and again new strains of the same genus, and of the Lady Fern, and other species, have cropped up, which really stand alone as examples of beautiful dissection, cresting, or other marked varietal character. At every show worthy of the name in these days, fine collections of Harts-tongues, Lady Ferns, Lastreas, Shield Ferns, and other species, may be seen; the first-named species, normally a simple plain-fronded fern, figuring in hundreds of different types, tasselled, dwarfed, frilled, fringed, and otherwise diversified in such a fashion, that, coupled with its perfectly evergreen and hardy nature, it constitues an ideal fern for cool conservatory or shady garden culture. In the Shield Ferns we have, as in the examples already mentioned, dense plumy fronds, so finely dissected and so redundant in growth as to rival even that miracle of ferny beauty the Todea superba of the Antipodes. The common Male Fern of our hedges and ditches may be seen as a stately tree fern, five feet high, with every terminal a graceful tassel, and by its side we may note a group of delicate dwarfs, crimped and curled and tasselled in like manner, a whole collection of which might be accommodated in a single window. The Common Polypody, which we may see on old wall tops or fringing the hedge banks, with its simple, once-divided fronds, has sported into scores of forms, among which the plumose or extra feathery ones, known as the Cambricum or Welsh Polypody section, are veritable evergreen gems, to say nothing of the many forms of the tasselled section of the same species. The several species, near relatives of the Male Fern, the Broad Buckler Fern, the Lemon-scented Fern, and the Hay-scented Fern, have all yielded crested and crimped and dwarfed varieties on pretty lines; and, in short, hardly one of our forty odd species but has "sported" more or less liberally to swell the ranks of the élite. This being so, and all these ferns being native, and therefore hardy, it is no wonder that now that they are once again presented to the public, minus the unattractive "curio" section, they are rapidly acquiring that popularity which they so undoubtedly merit. Thousands of cool, unheated conservatories, so situated as to lack that liberal sunshine demanded by flowering plants, are admirably adapted, by virtue of their shady position, for the accommodation of British ferns; while thousands of gardens in which the common forms, regarded by the connoisseur as merely the raw material of Nature's masterpieces, are grown in monotonous profusion, might well be improved by the substitution of a score or two of good varieties.

MR. GEORGE H. HOLLINGWORTH.

Mr. G. H. Hollingworth, whose portrait is given herewith, occupies an important position in the West of England as horticultural instructor under the Gloucestershire Education Committee. Though he is still a young man, Mr. Hollingworth has had a varied and thoroughly practical experience, as he was born in a garden, and when in his teens began to learn his business under his father, the late Mr. J. Hollingworth, who was at that time head gardener and bailiff to J. F. Campbell, Esq., Woodseat, Uttoxeter, and one of the best-known growers and exhibitors of grapes in the Midlands. Mr. Hollingworth, sen., was one of those men who believed in youths getting out into the world to gain experience, so he sent his son to Alton Towers, the seat of the Earl of Shrewsbury and Talbot, to serve under the late Mr. T. H. Rabone, who was a soundly practical gardener belonging to what is known as "the old school." After passing through the various departments from kitchen garden to orchid houses, Mr. Hollingworth was promoted, at the early age of twenty, to the post of general foreman, in which he carried out the instructions of his chief, who was also estate steward, and had a large staff of men under his charge. It was while he was at Alton that Mr. Hollingworth began to give expression to his views on horticultural matters in the gardening press, and he attracted the notice of Mr. J. Wright, V.M.H., then editor of the "Journal of Horticulture." This eventually led to an offer from the late Dr. Hogg of a post on the editorial staff of that paper, which proved to be a happy connection, and only came to an end when Mr. Hollingworth was appointed as an assistant lecturer in horticulture under the Kent County Council. After seven or eight years in this capacity he applied for, and obtained, the position he now holds in Gloucestershire, where he has charge of the horticultural teaching in a county where orcharding and fruit growing are industries of importance. The education authorities in Gloucestershire believe in administering a class of education that is adapted to rural needs, and in a few years gardens have been established under Mr. Hollingworth's supervision in connection with a large number of elementary schools in the country. As a lecturer and demonstrator Mr. Hollingworth's services are in great demand, and the fact that the teaching which he imparts is founded on his own practical experience goes a long way towards winning the confidence of the people who attend his classes.

International Horticultural Exhibition of 1912.—We understand that steady progress is being made in connection with the preliminary arrangements for the great International Horticultural Exhibition, to be held in London in 1912. The site of the exhibition has not been officially announced, but it is practically fixed, and the position is a very get-at-able one, with ample room, in pleasant surroundings, and so situated that its enclosure will be an easy matter. At the present moment the chief thing for those to do who are interested is to send along subscriptions to Mr. Edward White, at the Royal Horticultural Hall, together with a promise to guarantee a further sum in case of need.

The New Plants of 1909.—In the form of an appendix to the "Kew Bulletin," there has just been issued a very complete and descriptive list of the new garden plants of the year 1909. The list extends to 85 pages, and includes species, varieties, and hybrids, and is compiled from botanical and horticultural publications; a large number of the new plants have been described in the pages of the Gardeners' Magazine, and references are made to these in the Kew List. The authorities at Kew point out that the number of garden plants annually described in English and foreign publications is so considerable that it has been thought desirable to publish a complete list in the "Kew Bulletin" each year. Such lists are indispensable to the maintenance of correct nomenclature, especially in the smaller botanical establishments in correspondence with Kew, which are, as a rule, only scantily provided with horticultural publications. The Kew list includes not only plants brought into cultivation for the first time during 1909, but the most noteworthy of those which have been re-introduced after being lost to cultivation. Other plants included in the list may have been in gardens for several years, but either were not described or their names had not been authenticated until recently.

R.H.S. Committees' Outing.—Mr. and Mrs. Harry J. Veitch have again invited the members of the Royal Horticultural Society's Committees to East Burnham Park, on the day following the Holland House Show. The hospitality of Mr. and Mrs. H. J. Veitch is proverbial, and the beauty and interest of East Burnham Park are great, while, for the day, and for those who care for it, there is the added interest and mild excitement of a cricket match.

Vacant Land Cultivation.—The society that is devoting its attention to the cultivation of vacant lands by unskilled and only partially employed men, has Mr. Joseph Fels, Wilson Street, E.C., as its prime mover. In the second annual report, just issued, it is shown that the society now has the loan of considerable areas at Fulham, Westminster, Balham, Canning Town, Garratt Lane, Wandsworth, Cricklewood, Leyton, and Perivale. It has over fifty acres under cultivation, and more than four hundred plot holders, all of whom hold their plots rent free, and are advised and assisted by Mr. R. Lewis Castle, the society's expert superintendent. The total value of the produce raised by the men in three years, taken at a moderate average, exceeds £5,000, this including that used and sold at the prevailing retail prices of each district, namely, the prices the plot-holders would have to pay to shopkeepers or hawkers. The total sum expended by this society in the corresponding period to effect these results is less than the men would have had to pay collectively as rent for allotments in the London area at the customary rates. When it is remembered that the whole of the land thus employed had previously been practically waste—in some cases for many years—the advantages are obvious. The men and their families have profited substantially, and help has been rendered without pauperising the recipients. The men have learnt the full value of industry rightly applied to the utilisation of the resources of the soil.

Gardeners' Royal Benevolent Institution.—We may remind our readers that the seventy-first annual festival dinner of this charity will be held at the Whitehall Rooms, Hotel Metropole, London, on June 22, at seven o'clock, under the presidency of the Hon. Harry Lawson, M.P.

Steam Haulage of Market Garden Produce.—Mr. A. W. Smith, the well-known market gardener of Feltham, was recently fined, and had to pay costs, in connection with summonses for using an unlicensed road locomotive for the purpose of hauling his produce to Covent Garden. It was contended that the engines were being used for agricultural purposes, and therefore registration only and not a licence was necessary. The Richmond Bench considered the engines were used for haulage pure and simple, and not solely for agricultural purposes, therefore they imposed a fine of £5, and costs, but agreed to state a case for appeal.

Tree Pæonies in North Wales.—Miss Nelto Williams has very kindly sent us a photograph of one of the tree pæonies growing on the terrace in the gardens at Dendraeth, Penrhyndendraeth, North Wales, but the picture is not, unfortunately, suitable for reproduction. The specimen represented has pink flowers of immense size, stands 5ft. high, and has been eleven years in its present position. This year it has had fifteen blooms expanded at once.

May in the North.—The weather experienced during May this year has, on the whole, writes our Aberdeen correspondent, been finer with us than usual, for we had with one exception limited to a very small area, no squalls of hail, snow, or sleet, such as we often have during some parts of that month. The exception was in the Mintlaw district of Aberdeenshire, where, on the last day of the month, a heavy rainstorm, accompanied by hail, broke. For about a quarter of an hour the rain fell in torrents, and later a heavy shower of hailstones came on, and in a trice the ground and roofs of the houses were white. Short as the visitation was, it must have done much damage to the garden fruit crops now just beginning to form on the bushes. The only other occasion on which we had anything at all of the kind was on the 7th, a very cold day, when some of the rain that fell was of a sleety nature. The total rainfall for the month was about three inches, which is fully half an inch above the average for the last 40 years. As it was pretty well distributed over the month, falling on fully 16 days in moderate quantities, the ground has never been either too dry or badly soaked, although latterly the rain has been perhaps rather too plentiful. We have had a fair amount of sunshine, often quite brilliant and strong, with an almost cloudless sky, alternating with other days that were extremely cloudy. The wind was generally light, never very strong, and varied much in direction. Temperature during the earlier part of the month was rather low, with decided spells of frost on a few clear mornings. The hills have sometimes had a good deal of snow on them. Many of the whin bushes are withered and dead. Laurel leaves have also been quite ruined by the frosts. The latter part of the month, however, was very favourable for vegetation, and grass is now coming away beautifully and with a fine colour. The swallows were late in arriving this year, it being after the 20th of the month before one could count them in any numbers. At the close of the month the trees were all mostly in leaf, except the ash, and even that was opening out its buds.

Botanists and Humour. Botanists are generally regarded as intensely serious folk, but they are on occasion unconsciously humorous. The last thing, however, one would expect from botanists is a journal dealing wholly with the humour of botanical work and study, and yet such a journal has been issued under the title of "The Sportophyte," from the Manchester University, the editor being Dr. Marie Stopes. Jokes, humorous anecdotes in prose and verse, and parodies of serious articles appear, the whole making light reading for odd moments. "Punch" had better look to its laurels now that botanists have seriously entered the field of humour.

Proposed New Open Space for Kilburn.—At a largely-attended and influential gathering held at Kilburn a short time ago, it was decided that an effort should be made to secure The Grange, on the Kilburn High Road, for the public use. The Grange estate consists of about 9¼ acres, and is the centre of a large population. It is estimated that there are 87.2 persons per acre in Kilburn, and 4,000 children under 15 years of age.

There is no open space near by, as Hampstead Heath is two miles away. Local support has been promised, and a public appeal for funds is now being made, for which Mr. W. G. Snowdon Gard, of Rosslyn Hill, Hampstead, is acting as hon. treasurer.

York Floral Fete and Gala.—In our next issue we shall publish a full descriptive and illustrated account of this great exhibition, to be held at York on Wednesday, Thursday, and Friday next.

Eastbourne's New Park.—When the Duke of Devonshire succeeded to his title, he commemorated the event by presenting a pleasure-ground at Motcombe to the Borough of Eastbourne. This has been now laid out, and was opened to the public on Saturday last. The grounds are charmingly situated in the valley of the Bourne, and surround a pretty lake.

Addlestone Rose and Sweet Pea Show, which is fixed for Wednesday, July 6, promises to be exceptionally attractive this year. There are a number of open classes, including one for roses confined to trade exhibitors, in which the award is a challenge cup, at present held by Messrs. B. R. Cant and Son. Sweet peas will, of course, be strongly represented, and the leading growers are arranging to stage exhibits.

Flowers in Motor Cars.—In well-appointed private motor cars it is now quite the proper thing to find one or more vases fixed for the reception of flowers, and, in most cases flowers are placed in them. We have noticed that during the past few weeks almost all such cars have carried a little bouquet of white flowers, but on Saturday last we saw dozens of fine cars in which coloured flowers were carried in the vases, showing that there is a slight relaxation of the outward and visible signs of national mourning.

Origin of Wm. Allen Richardson Rose.—In a lengthy, but very interesting communication to the "Rose Annual" for 1910, E. V. Lucas discusses various attempts to discover the origin of the famous and beautiful William Allen Richardson rose, and gives the history of the variety as sent from America, as follows: "William Allen Richardson was born in New Orleans, La., on February 20, 1819. When he was but two years old his father moved to Lexington, Ky., where he resided until his death, in October, 1892. William Allen Richardson married Miss Mary Short, daughter of Charles Wilkins Short, the botanist, who pursued his favourite studies of botany and horticulture at his country place, 'Hayfield,' some five miles south-west of Louisville. With this congenial companionship, Mr. W. A. Richardson established himself in an adjoining place, 'Ivywood,' and became much interested in the cultivation and propagation of roses. He imported a good many, and in this way became acquainted by correspondence with Madame Ducher (or she may have been called Veuve Ducher), at Lyons, France, who was especially interested in a rose which he sent her of a pale yellow colour, and she wrote Mr. Richardson that she had a sport from this rose in her own garden, which, if successful in propagation, she would name for him; hence the name as applying to the beautiful copperish yellow rose."

Red Gum Wood for Railway Sleepers. It is stated that last year enquiries were received in South Australia for one million railway sleepers, cut from red-gum (Eucalyptus), for America. The contract could not be taken up, because the supply of red-gum for sleepers is rapidly being used up for Australian railways, but it is of interest as showing that even the United States are having to look about for timber supplies. The expenditure of the South Australian/Woods and Forests Department, observes "Nature," has been increased from £10,080 to £17,575. The intention is to encourage in every way the planting of pine, gum, and other trees, even to consider the advisability of offering a bonus sufficient to cover the cost of the necessary attention to the trees for the first four or five years of their existence. Wasteful methods of handling mature timber are still in vogue. We are told that only about one-third of the timber on any given area is properly utilised, the rest being destroyed by axe and fire owing to the unsystematic and wasteful character of the lumbering operations.

Vanilla Culture in the West Indies promises to increase owing chiefly to the passing of a pure food law in the United States. By this law all the materials used in food products must be declared, consequently the public has discovered that a good deal of vanilla is synthetically prepared, and they have decided for the natural product. This has led to a larger demand, and better prices for the produce of the only orchid that has any marked economic value.

EVERGREEN RHODODENDRONS.

Although we have rhododendrons of one kind or another in blossom during the whole of the spring months, June may be said to be the time when the evergreen varieties are at their best, for during that month the numerous varieties and hybrids of R. catawbiense, R. ponticum, etc., are in bloom. A great many estates throughout the country are famous for their rhododendrons, and some proprietors throw their grounds open to the public in rhododendron time. The same thing is done by some of the great nurserymen, and the wide breaks of young plants covered with crimson, red, lilac, white, mauve, or purple flowers, relieved here and there by large bushes or standard plants, are wonderfully effective, and people who are able to visit these places are well repaid for their trouble.

Not content with throwing open their nurseries, however, some nurserymen go a step further, and transport many wagon loads of plants to places where the general public can admire them. Londoners are familiar with the effective exhibitions made by the two firms of Waterer, one of whom, Messrs. J. Waterer and Sons, display their plants in the Royal Botanic Gardens at Regent's Park, and the other, Mr. Anthony Waterer, in Hyde Park. From these two groups anyone who contemplates the planting of rhododendrons can select an ample number to meet his requirements, for most of the best varieties are to be seen, not as tiny plants with two or three heads of flowers, but as large bushes covered with blossoms. Then some of the municipal bodies in large towns have formed fair collections in their parks, while the Rhododendron Dell at Kew is one of the most popular features of the famous gardens.

The practice of planting rhododendrons in thin woodland has been largely adopted in some places with very effective results, and in some instances the plants have become naturalised. This is particularly so with the well-known R. ponticum, for in places which are peculiarly suitable for rhododendron culture it has seeded, and spread from naturally-layered branches to such an extent that large areas have been covered from the few plants which were first introduced. A striking example of this is noticeable at Foxhill, an estate near Frodsham, in Cheshire. Behind the mansion a hill rises to a height of 200 feet or so, which is more or less clothed with pines, the natural soil being sandy peat. About 25 or 30 years ago walks were cut in a zig-zag manner over the greater portion of the hill, and plants of R. ponticum were placed here and there about the margins of the paths. By natural increase these have spread into very large masses, which make a glorious display each June. R. ponticum is one of the very best kinds for planting in woods, independently of its habit of rapid increase, for the colour of the flowers is well adapted to semi-shade. Reds, on the other hand, are not suitable for such situations, but should be placed where they can obtain a really good light, for a mass of some bright red variety in half-shade looks decidedly out of place.

In addition to the two species previously mentioned, R. arboreum and R. caucasicum have exerted some influence in the production of the numerous garden varieties, while a race of fragrant flowered sorts has originated by using the Chinese R. Fortunei as a parent. The Himalayan R. Griffithianum has found favour with some hybridists, but its progeny is better suited to the mild climate of the south-west counties than to places where greater cold is experienced.

The connoisseur amongst garden rhododendrons finds his ideal in the shapely conical trusses of bloom so familiar in R. catawbiense and its varieties, while its exceptional hardiness and bold, handsome foliage are other points in favour of this species. It has, however, been necessary to introduce the blood of other species to obtain variety of colour, but the object of raisers has always been to retain the chief features of R. catawbiense, and in this they have been eminently successful.

When planting rhododendrons the chief care should be that the ground is fairly free from lime, and that it is moderately well drained, for the two things that rhododendrons most detest are lime and sour soil. Although they thrive in peat, peat is not essential to their well-being, for they grow very well in both light and heavy loam. Deep planting is objectionable, and the use of manure in a fresh state is not advised. A surface dressing of rotten leaves forms a valuable asset, for it keeps the roots cool and moist.

Among the numerous varieties the following will be found a good selection: Amphion, rosy pink; Ascot Brilliant, blood-red, large flowers, loose truss; C. S. Sargent, bright red; Chas. Dickens, red; Doncaster, scarlet; Duchess of Bedford, crimson; Duchess of Connaught, white with yellow markings; Earl of Shannon, crimson; Florence Smith, pink; Florence, pink; Frederick Waterer, crimson; Gomer Waterer, white; George Paul, crimson; Helen Waterer, white with red margin; James McIntosh, rose-crimson; James Marshall Brooks, bright red with brown markings; James Nasmyth, rose lilac; John Waterer, crimson; Kate Waterer, rosy crimson with yellow markings; Lady Clementine Mitford, peach colour; Lady Grey Egerton, silvery white; Manglesi, white; Martin Hope Sutton, scarlet; Maxwell T. Masters, crimson; Michael Waterer, scarlet; Marchioness of Lansdowne, rose with dark spots; Marchioness of Tweeddale, pink with brownish markings; Mrs. Anthony Waterer, white; Mrs. R. G. Shaw, blush, maroon blotch; Mrs. Holford, salmon-pink; Minnie, white; Mrs. T. Agnew, white; Pink Pearl, pink; Mrs. E. C. Stirling, white; Sappho, white with dark blotch; and The Queen, white.

W. Dallimore.

THE NEWER LILACS.

Of all spring-flowering subjects in the garden none are more appreciated than the lilac; even the ordinary form of Syringa vulgaris is lovely; but when we consider the great improvement made in varieties during the last fifteen years, or even less, one cannot wonder at the appreciation the newer forms find with those who are conversant with them. Most of these have larger panicles of bloom, while the individual flowers are of greater size and better form than in old varieties, and the colours are more intense and varied.

As an illustration we may take the variety Souvenir de Louis Spathe, and compare it with the type, or even with Charles X. In the newer variety the colour is again intensified, but even this is superseded by Negro in point of colour, for the latter retains its purple blue colour for a longer time; individually, too, the blooms are larger.

Of double and single-flowered varieties it is an easy matter to select four dozen that are quite distinct, and this is quite ample for even a large collection. But seldom do we see lilacs given a fair share of attention; too often they are crowded in the shrubberies, and more often than not given a position under tall forest trees, where they struggle on, and seldom have a chance to display their beauty of colour and form.

To grow lilacs well abundance of space should be provided, in order that the growths may become properly ripened each season, this being necessary to ensure freedom of flowering. Deeply-dug and well-manured stiff soil will grow lilacs to perfection, provided they receive other attention, such as the removal of suckers, which too often spring from the common stock upon which the choicer varieties are grafted. The removal of weakly shoots to ensure the perfect maturation of the stouter ones is also necessary, and copious supplies of liquid manure in May, when the panicles are developing, is of great assistance in increasing the size of the blossoms and improving the colour. Newly-planted bushes should be pruned to within an eye or so of the base with a view to secure a dwarf specimen of good shape, as some varieties are apt to run up in an ungainly manner.

The following are a few of the newer varieties worthy of any collection:—

Double-flowered Varieties.

It seems difficult to realise a finer white-flowered lilac than Madame Lemoine, but the newer variety—Miss Ellen Willmott—is a distinct advance in purity of colour and size of the individual blossoms. The panicle in Madame Lemoine is perhaps longer, and the newer variety is later in developing its flowers, which is an advantage, as the season is thus extended. Jeanne d'Arc is a desirable sort where greater variety is required. President Loubet has carmine buds and deep purple-red flowers. Waldeck Rousseau is a charming variety, with extra large flowers of a rosy-lilac colour, becoming white towards the centre. Maurice de Vilmorin has a thick panicle, and the buds are attractive by reason of their rich red colour, but when expanded they are blue with a white centre. Dr. Troyanowsky has enormous panicles of rosy-pink buds, but the flowers are azure-blue when open. Comte de Kerchove is free-blooming, and a showy variety with rich red buds and rosy-pink flowers. Madame Jules Finger is very fragrant, with satin-rose flowers. Condorcet has the largest panicles of any variety, and the flowers are a lovely shade of blue. Marc Micheli has pink buds that open into blue flowers. Souvenir de L. Thibaut has rose-coloured buds, with a purple-shaded blue flower.

Single-flowered Varieties.

Othello is quite a superior variety, and the blooms are so placed that they do not overlap each other, which gives it a distinct and desirable appearance. The deep claret-coloured flowers have a red border, but when open are pale red. Uncle Tom is of a deep violet-purple. Dr. Mirabel has tall, erect panicles of claret-coloured buds, opening into purple-lilac flowers. Gloire de la Reine has red buds, changing to violet. Professor Stockhart is a lilac shade of blue. Gloire de la Rochelle has rosy-lilac flowers, changing to a light shade of blue. Pasteur has erect trusses of large flowers of a wine-red colour, changing to mulberry-red.

Swanmore Park. E. MOLYNEUX.

STOPPING PERPETUAL CARNATIONS IN SUMMER.

There is a three-fold object in stopping perpetual carnations during the summer. Stated briefly, it is to encourage continuity in blooming, to preserve and build up the plant's energy, and to obtain a shapely plant.

There is no wisdom in allowing your plants to make a lot of unnecessary top growth, and then go to them one morning and make a wholesale slaughter. This is simply wasting their energy, and causing a check, and it also encourages the plant to crop all at once instead of producing a continuous supply of bloom. It is only natural that if the growths of a variety are all stopped at one time they will flower together. The object should be to go over the plants, say, twice a week, just stopping what growths are in a fit and proper condition to be so treated.

If plants are out in the open it is never wise to stop them during dull rainy periods, as the growths are very much more soft and sappy, do not break so evenly or produce so many breaks, and it also causes a greater check to the plant.

There is one golden rule which it behoves all carnation growers to have deeply impressed on their memory. Never pull out the point of a growth. Such stopping is premature, and results in a number of weak breaks. If the growth is long enough to be stopped break off the top, if not leave it. Naturally, one asks: When is a growth of sufficient length to be stopped? and I say, as a general rule, when one can remove two developed leaves and leave six good joints or sets of leaves on the plant or branch. But, with the long, loose-growing varieties it is best to pinch the growth in a little harder.

I hope I have made myself explicit. After the young plant has received its first stopping it produces side growths, which, as a general rule, should be treated as stated by stopping them as they become long enough to be so treated.

Then we come to the final crux of the whole subject, i.e., when to cease stopping so as to obtain the best results during the winter. The perpetual carnation is perpetually flowering simply because it is perpetually growing, but, naturally, the winter growth is much slower than the summer growth, and if it is stopped too late in the summer it will have too much to do in the fall to produce bloom by the winter. On the other hand, if it is not stopped sufficiently late it will produce a quantity of blooms in the autumn, when they are not so highly prized.

Again, varieties vary, and each requires special study, while latitudes also have to be taken into consideration. It will be understood that those who grow carnations for a living have worked this matter down to a fairly fine proposition, and it is this which prompts me to write on this matter.

All the British-raised varieties, such as Britannia, Mrs. Burnett, Black Chief, Rose Doré, Rival, etc., are best if potted early and flowered in seven-inch pots. These should be left until they elongate for flower, or are some six inches high, with eight or nine good joints to break from before being stopped. This will be about May or early June, and beyond stopping, say, one odd side growth in each plant, they are best allowed to make straight off for bloom. None of our present varieties grow so quickly as the Americans in the winter, and they will not stand a second stopping and also produce early winter bloom.

Such varieties as Enchantress, White Enchantress, Rose Pink Enchantress, Beacon, Helen M. Gould, Afterglow, Aristocrat, Sarah A. Hill, Winona, White Perfection, etc., should be stopped until the end of July.

Winsor, Mrs. T. W. Lawson, Red Lawson, White Lawson, Victory, May Day, etc., should be stopped until late August.

Of course, there are many other varieties, but the above include the best, and will suffice to give an idea of the irregularity of stopping. At no time should more than one growth be stopped on a plant at once. It must be understood that the actual growth you stop will not produce flowers until some five to six months later, and that is, perhaps, the best guide.

MONTAGUE C. ALLWOOD.

SAVING SEED POTATOES.

Seeds are required to be ripe when they are harvested. This condition applies to nearly all kinds of seeds, so that probably some readers of the GARDENERS' MAGAZINE may be surprised to learn that many unripe potato tubers remained sound when matured ones rotted. I am referring to those of early varieties. I was, when quite a youth, assisting the owner to lift and store some kidney potatoes, but the tubers peeled to such an extent that, after lifting about two bushels, work ceased, and the tubers were allowed to remain in the ground until they were ripe. The lifted tubers, both large and small, were spread out thinly on the floor of a dry loft in the buildings, and were allowed to remain there until the following spring. Very little care was bestowed upon them for some time, and, owing to exposure, they turned quite green.

In due course the remainder of the crop was lifted and carefully stored, the skins being well fixed. The seed tubers were stored, but nearly all, if not quite all, decayed. Then attention was turned to those unripe tubers as they were all that were left of that particular variety, and frost was carefully excluded. Short, sturdy sprouts grew, and not a single tuber rotted or showed signs of disease. Probably disease had set in and laid a firm hold upon the tubers lifted later in the season, but at the time they all appeared to be sound.

Ever since that time, in dealing with my own seed tubers, I have spread them out thinly on mats under well-tilted frame lights, and carefully turned them over several times until the skins are firm and turning green. Then I store them in shallow boxes and on shelves exposed to the light, not covered, but kept safe from frost. Seed of late sorts are similarly treated as far as possible, and they have, so far, kept sound, while close-stored tubers have rotted badly. G. B.

NARCISSUS COLLEEN.

Very many new and beautiful daffodils have appeared during the season just closed, but so great have been the improvements made in the last few years that the standard of judgment has been raised correspondingly higher. The consequence is that comparatively few varieties pass muster before the Daffodil Committee of the Royal Horticultural Society, and when a variety does secure an award or certificate, there can be no question as to its merits. Colleen is one of the few that gained an Award of Merit in 1910. It is a charming variety, with broad, thick perianth segments of the purest whiteness, its slightly reflexing form indicating descent from one of the finest forms of the poeticus family. It has good size as well as an excellent form to recommend it, and the purity and substance of the perianth are enhanced by the flattish and moderately broad cup, which is of an unusual shade, and extremely attractive. The colour of the cup is green, with a yellowish tinge, and it is this charming green shade that suggested the name of Colleen, a name very well known to our friends in the Emerald Isle. Colleen secured its Award of Merit on May 3, when exhibited finely by Messrs. R. Wallace and Co., of Colchester.

ROSES ON WALLS.

It is not often that one sees hybrid perpetuals trained as climbers on walls. When I was a youth I took some plants of Prince Camille de Rohan, Duke of Edinburgh, and several other varieties, with me when I had a holiday, and planted them in a border close to the walls of the house—my home. They were nice plants in 6in. pots, and were just right for planting out. As years went by the roses were trained to the wall, and treated as climbers—my people could not bring themselves to the point of hard pruning.

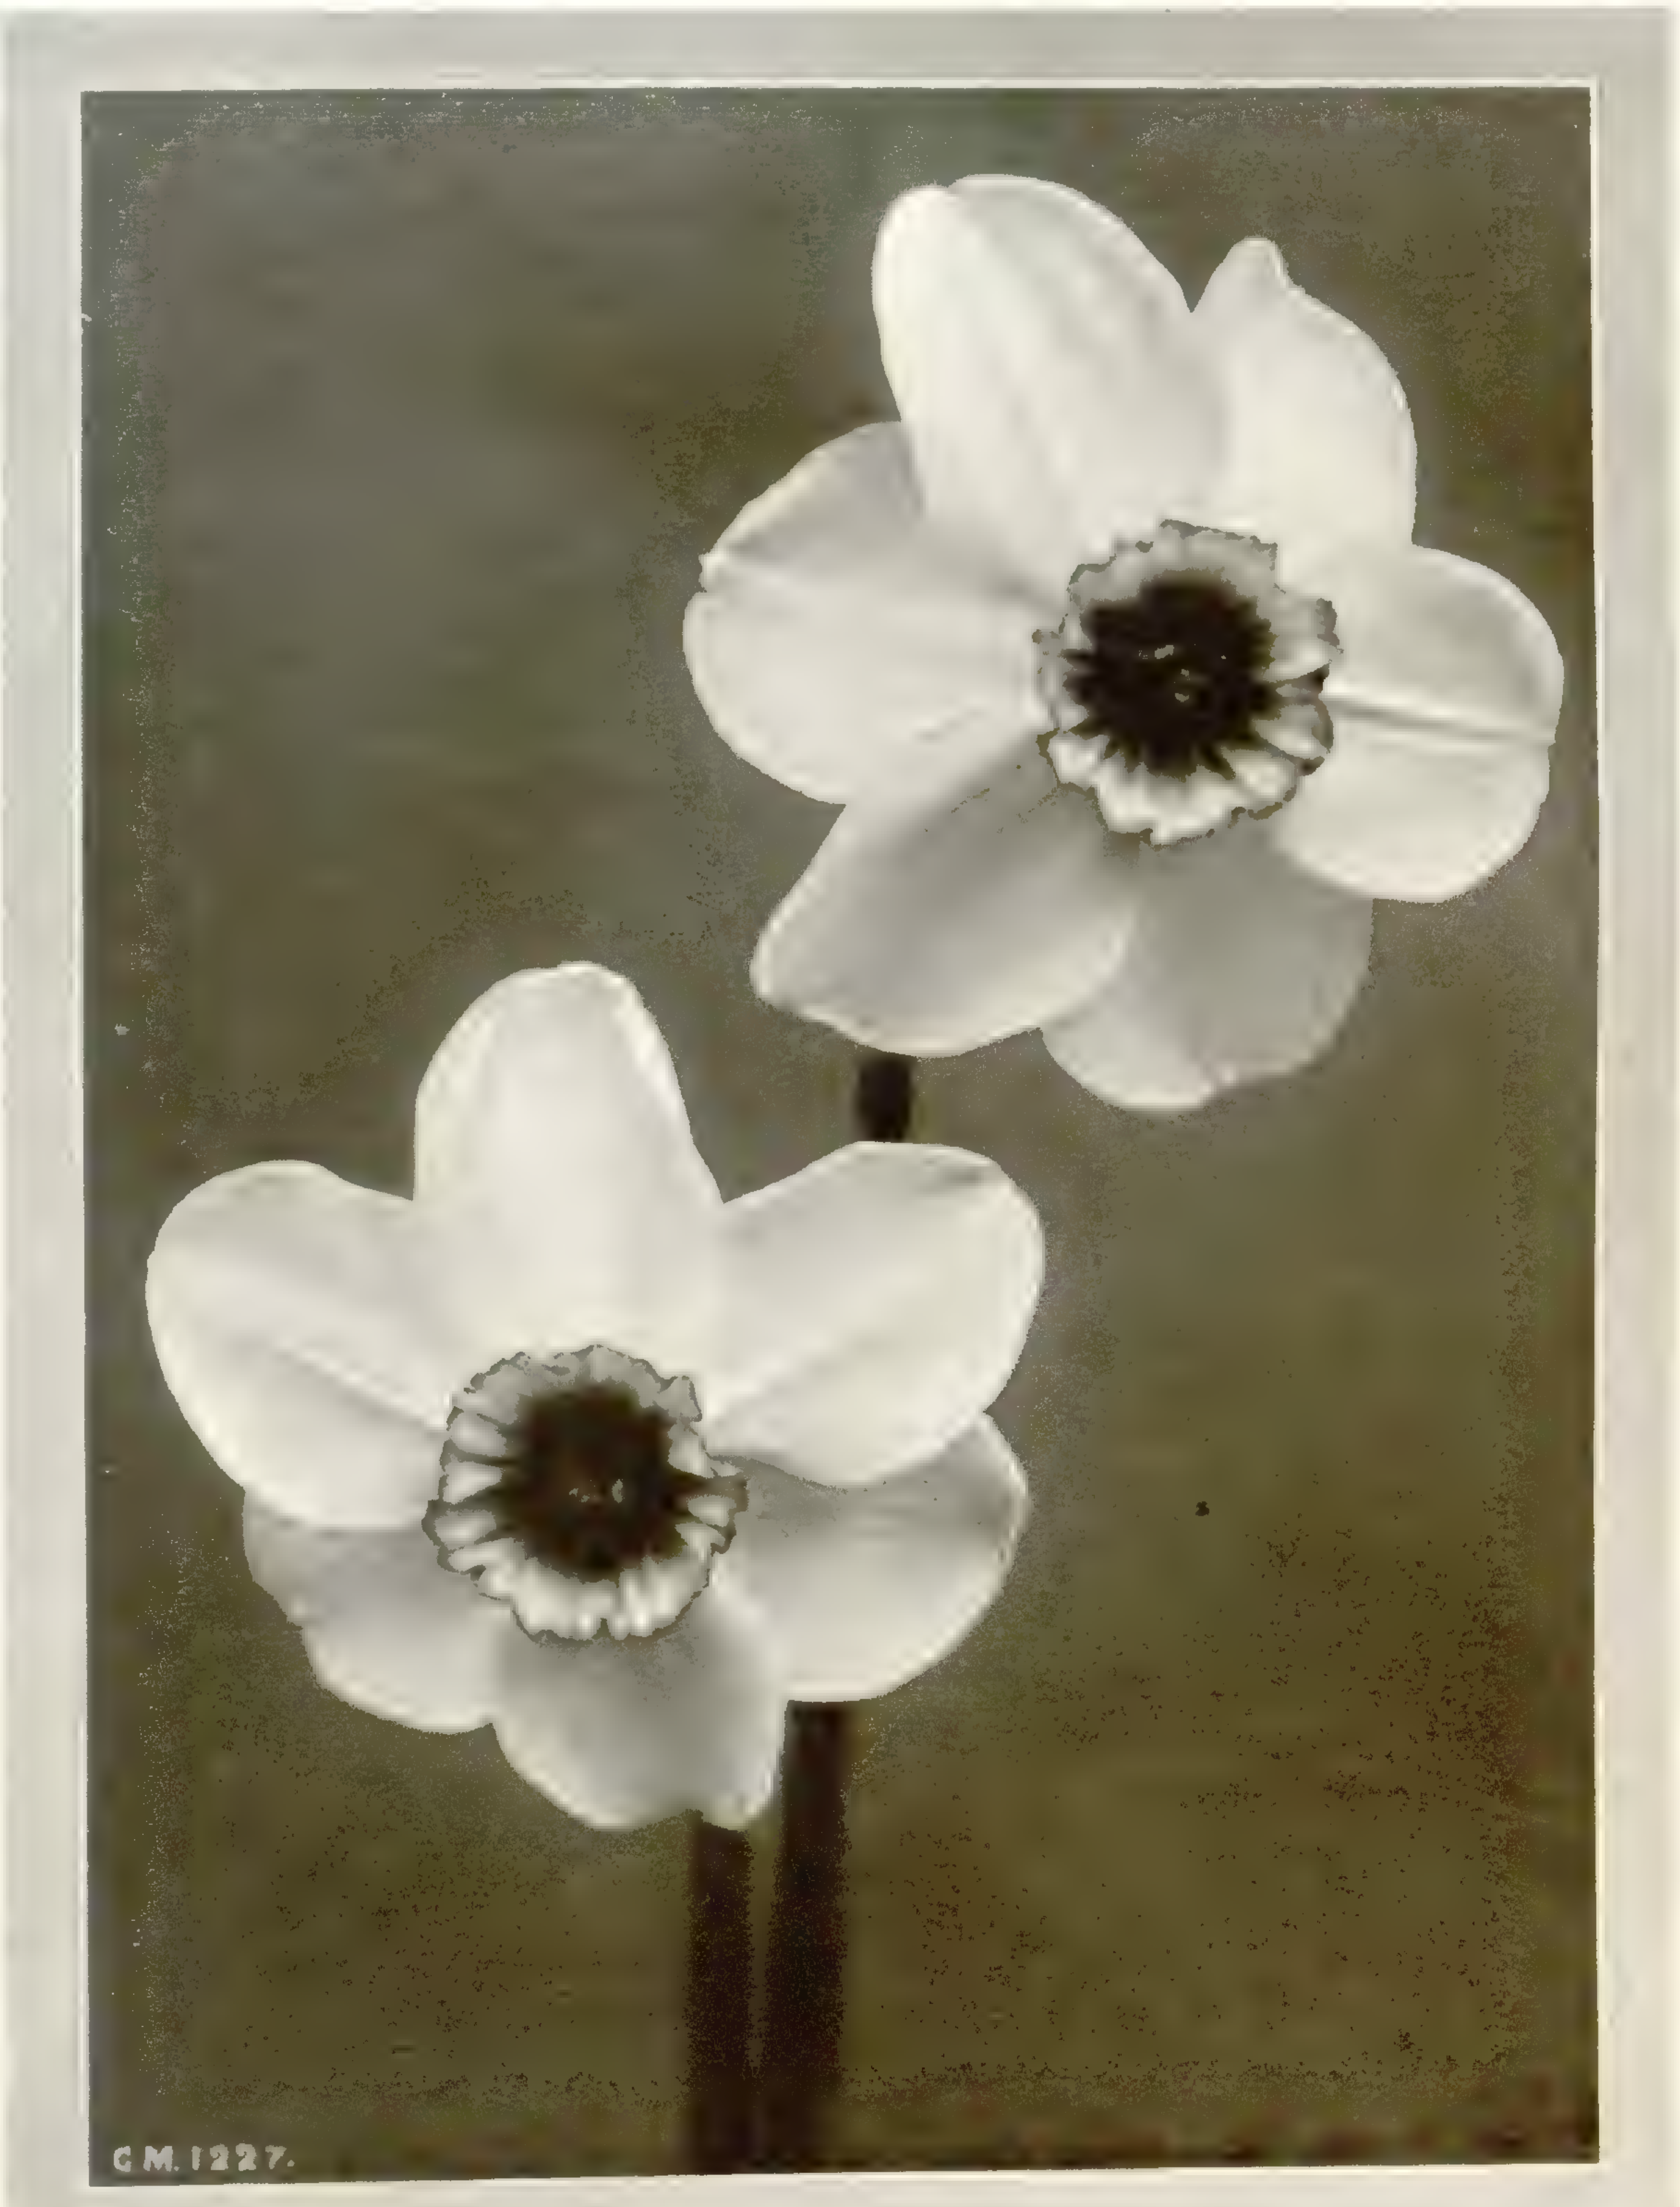
In due time, the whole of the front of the house—nearly 60ft. long—was well covered with the branches, and the blossoms were greatly admired by the passers-by, as well as by friends. I never saw any hybrid perpetuals flower so profusely as these did. In fact, they were the cause of the house being renamed. It was, owing to the roses, called "Rose Farm."

Roses growing in borders near walls rarely get sufficient supplies of water. As a rule, several different kinds of climbing plants are grown in the same border, and the soil quickly gets thoroughly permeated with roots. Less attention is given to the training of roses and clematises on walls than other kinds of plants; and when the roots of roses are starved the branches suffer, too, being weakly, with discoloured leaves which fall an easy prey to red spider.

Experienced cultivators never allow their wall roses to suffer, but there are others who do not give the matter much thought. Even when the rainfall is comparatively heavy plants in wall borders rarely get enough, except in cases where there is no guttering fixed; then the soil becomes saturated.

The soil in the border, if dry, should be well drenched with clear water, and a few hours afterwards given a thorough watering with diluted liquid manure. Weekly doses will not be too frequent, and if a surface mulch of rotted manure and lumpy, turfy loam, mixed, be put on, and the foliage kept free from insect pests, the roses will be more satisfactory than ever they were.

G. B.



NARCISSUS COLLEEN.
Flowers white, with yellowish-green cup. A.M., R.H.S., May 3. Messrs. R. Wallace and Co., Colchester.

ERYNGIUMS OR "SEA-HOLLIES."

Among the eryngiums are found a number of extremely ornamental border plants in which the general character of the flower heads give them somewhat of a thistle-like appearance. The hardiest members of the genus are European plants; two of the species, namely E. campestre and E. maritimum, are indigenous to the British Isles. The latter is a meritorious subject, well worth a position in every garden, as it succeeds under a variety of conditions and produces its glaucous-blue flower heads upon stems some 18 inches high during July and August. E. maritimum is, however, surpassed in beauty by E. alpinum, a species that reaches an average height of two feet: the stems and involucres are of the richest blue, and are quite conspicuous in the border among other subjects; the radical leaves are cordate in shape, while the bracts are finely serrated.

The finest colour among eryngiums is found in E. amethystinum, a species having flowers, bracts, and stems of a most intense steel-blue; the bract leaves are much longer than the flower heads, and are deeply cut into fine filament-like strips. It grows about 18 inches in height, and is much looser in habit than E. alpinum. E. Oliverianum is one of the most reliable and free flowering species, being a vigorous grower, up to 4 feet in height; in flower it is most conspicuous owing to the number of bracts which compose the involucre; the flower heads are slightly heavier than in E. amethystinum, and also longer than the cone-shaped heads borne by that species. E. Bourgati grows to a height of two feet, and produces smaller flowers of a deep blue colour; the bract leaves are erect and appear to contract around the central cone. E. planum is a most desirable dwarf subject, yielding quantities of small, round, vivid blue flowers on stems of the same colour; the bract leaves are narrow and flat. It is an excellent subject to plant in masses, being at its best throughout July.

E. giganteum produces massive stems and large flower-heads of a silvery-blue colour; the bracts and stem-leaves are deeply serrated, and the bracts are scarcely so long as the central head of flowers; the radical leaves are cordate, having the margins finely serrated, and they are carried upon long foot stalks. E. giganteum attains a height of 4 feet, and is an excellent subject to form bold groups. E. pandanifolium is chiefly notable on account of its leaves, which frequently attain a length of 6 feet. It is generally seen to best advantage as an isolated specimen, although it is not without merit when planted as a colony in the wild garden. The flowers are small, globe-shaped, and of a purplish colour; the bract leaves are inconspicuous.

Eryngiums succeed in any light, well-drained soil, and the richest colouring is generally obtained when they are planted in sunny positions. Of those enumerated E. pandanifolium is the only species of questionable hardiness, and it is best treated as if only half-hardy, affording it some protection in winter. They never display their fulness of beauty the first season, and, once they become established, it is not advisable to disturb them, as they gradually increase in strength and beauty. The simplest and safest means of increasing eryngiums is by seed, which generally ripens on home-grown plants, and is best sown in pans or boxes as soon as gathered, and wintered in a cold frame; the seed germinates in spring, and the seedlings are subsequently transplanted to a nursery bed in the open. Division of the crowns and root cuttings may also be practised as a means to increase the stock; both methods are slow, and generally result in weakening the plants for some considerable time.

Thomas Smith.

THE GARDEN OF HERBS.

(Concluded from page 431.)

◆

Marjoram and Savory.

There are three varieties of marjoram, the Common Marjoram (Origanum vulgare); there is also the Winter Sweet Marjoram (O. heracleoticum), and the pot Marjoram (O. Onites), all of which are useful as herbs either for infusion or fomentation.

Summer Savory (Satureia hortensis) is an annual plant, which is nearly allied to thyme; it is used for flavouring dishes, and is cultivated in kitchen gardens, growing to one foot in height. Winter Savory (S. montana) is a perennial, and is useful for the same purpose as the summer variety; it can be increased by cuttings and slips.

Rampion and Southernwood.

Rampion (Campanula rapunculus) has beautiful pale blue bell-shaped flowers, and is grown for its roots, which are used as a salad more on the Continent of Europe than in this country.

Who is it who has not seen and remembered this pleasant herb, Southernwood (Artemisia abrotanum)? It is still cultivated in old-fahsioned gardens for its pleasant aromatic odour and perfume.

Wormwood and Tarragon.

Wormwood is also an artemisia; it is A. vulgare, and, as its name implies, is useful for removal of troublesome parasites in children and in domestic animals. It also possesses tonic and stimulating propensities.

Tarragon is another artemisia, A. dracunculus, and is used for flavouring vinegar and sauces.

Hyssop and Horehound.

The common Hyssop (Hyssopus officinalis) has beautiful blue flowers, and grows one and a-half feet high; it has an agreeable aromatic odour, and the leaves are used for culinary purposes, such as seasoning. This is not the hyssop referred to in the Bible, it being a quite different Eastern plant.

Horehound (Marrubium vulgare) is found on wayside places occasionally, but, on the whole, is rare in this country; it is used as a tonic remedy for coughs; it acts also as a stimulant and laxative. Besides these we have also

Burnett and Dandelion.

Burnett (Poterium sanguisorba), derives its name from a drinking vessel, its leaves being used in cool tankards and in soups and salads; it is still cultivated in our old gardens.

The dandelion is the well known weed so difficult to eradicate from one's garden, yet, we are told, it is useful as a liver medicine.

Miscellaneous Herbs.

Chives and skirret are, more strictly speaking, vegetables, as they are useful chiefly for the roots. The following are all annuals, and their uses are given in the list at the end: Basil, carraway, chamomile, chervil, coriander, mallow, marigold, orache, purslane, and tobacco. Regarding the latter, which although not cultivated in our gardens as a herb, is yet spoken of by Kingsley with esteem as "the soveraine herb" and Salvation Yeo in "Westward Ho!" he describes it as—

> "A lone man's companion,
> A bachelor's friend,
> A hungry man's food,
> A sick man's cordial,
> A wakeful man's sleep, and
> A chilly man's fire."

Yet it must be approached with caution as to some it may be more of a poison than a remedy or benefit.

Regarding the cultivation of the above. The annuals may be sown about the end of April, and thinned out later, and the perennials from April to June or July for the following year's use, when success will be more certain, these latter being placed in their permanent quarters in October. When herbs are ripe for cutting and drying they must be tied in bundles for future use. The drying should be done in shade, never in hot sunshine or before a fire.

A List of Herbs.

Giving English and Latin Names and their uses.

ANNUALS.

Anise (Pimpinella anisum).—An aromatic plant; its leaves are used for seasoning.

Basil large or sweet (Ocymum basilicum).—For flavouring soups.

Caraway (Carum carui).—Principally used for flavouring.

Chamomile (Anthemis nobilis).—Used for medicinal purposes.

Chervil (Chœrophyllum sativum).—Very fine for salads.

Coriander (Coriandrum sativum).—Used in soups and salads.

Mallow, curled (Malva crispa).—So called from its emollient qualities.

Marigold, pot (Calendula officinalis).—Its flowers are used in soups.

Orache (Atriplex patula).—A summer herb much esteemed in France.

Purslane, green and golden (Portulaca oleracea).—Its young shoots are used in salads.

Savory, Summer (Satureia hortensis).—Much used for seasoning).

Tobacco (Nicotiana Tabacum).—Used for smoking.

BIENNIALS.

Borage (Borago officinalis).—Used in salads and in claret cup.

Dill (Anethum graveolens).—Leaves used in sauces and pickles.

Rampion (Campanula rapunculus).—Used for salads.

PERENNIALS.

Angelica (Angelica archangelica).—Eaten like celery.

Balm (Melissa officinalis).—Chiefly used as an infusion.

Burnett (Poterium sanguisorba).—The leaves have the flavour of cucumber and are largely used for salads.

Cardoon (Cynara cardunculus).—Grown for use like celery.

Chives (Allium schænopraeum).—Used as a substitute for onions.

Dandelion (Taraxacum officinale).—Used as a liver medicine.

Fennel (Fœniculum vulgare).—Used in fish sauce and for garnishing.

Horehound (Marrubium vulgare).—Used for asthma and coughs, possesses tonic properties.

Hyssop (Hyssopus officinalis).—Leaves and shoots used as pot herbs.

Lavender (Lavandula vera).—Esteemed for its aromatic flowers.

Marjoram, sweet and pot (Origanum vulgare and O. Onites.—Used in soups and for seasoning.

Rosemary (Rosmarinus officinalis).—Sprigs are used for garnishing and the leaves are used in summer drinks.

Rue (Ruta graveolens).—Leaves are used for garnishing; excellent for poultry.

Sage (Salvia officinalis).—Leaves are used for stuffings and sauces.

Savory, winter (Satureia montana).—Much used for seasoning.

Skirret (Sium sisarum).—Tubers boiled and served up with butter; also used in stews.

Sorrel (Rumex acetosa).—Principally used to impart an acid flavour to salads.

Southernwood (Artemisia abrotanum).—A well-remembered sweet scented herb.

Tarragon (Artemisia dracunculus).—The leaves are used for salads and pickles.

Thyme (Thymus vulgaris).—For soups, sauces, and stuffings.

Wormwood (Artemisia vulgare).—Used in drinks as a tonic.

Penny Royal (Mentha pulegium).—Used medicinally.

The Language of Herbs.

Name and Meaning.
Rosemary—Remembrance.
Rue—Disdain.
Thyme—Activity.
Lavender—Distrust.
Sage—Domestic virtue.
Fennel—Worthy of all praise.
Angelica—Inspiration.
Marigold—Jealousy.
Mint—Virtue.
Basil—Hatred.
Mallow—Beneficence.

Name and Meaning.
Camomile—Energy in adversity.
Borage—Bluntness.
Balm—Sympathy.
Dandelion—Oracle.
Hyssop—Cleanliness.
Marjoram—Blushes.
Sorrel—Affection.
Southernwood—Jest, bantering.
Wormwood—Absence.
Penny Royal—Flee away.

A Calendar for Herbs.

This is arranged for the South of England and Ireland. The North would be a fortnight later.

January.—A small hotbed should be made by which such herbs as mint, tansy, and tarragon may be forced.

February.—Seed may be sown of the following in warm borders: Borage, burnett, angelica, thyme, marjoram, savory, and such-like.

March.—Seeds of all herbs may be sown, and cuttings may be planted of shrubby kinds.

April.—All herbs may now be planted.

May.—Sowing and planting may still be done, and beds of mint made up.

June.—Seedlings from the sowings made in February and March may now be planted in their permanent quarters.

July.—Herbs that are ripe may now be gathered and dried.

August.—Increase many herbs by cuttings, and gather and dry the same as July.

September.—Sow chervil for winter use.

October.—Clear the herb garden of weeds, and give it a top-dressing for winter.

November.—Put leaves over the bed to remain during winter.

December.—Keep the box edging and walks neat and tidy.

Walter Smyth.

Epacris.—In some few gardens a small collection of epacrises is grown, and where their cultivation is a success and the flowers are produced during the winter and the early part of the spring, these elegant greenhouse plants are useful for giving colour in the conservatory, where it is especially appreciated. They may be successfully cultivated by using fibrous peat and sand and well-drained pots, giving them a light position where they will enjoy abundant ventilation, and watering them carefully. Use well drained pots, and press the new soil very firm, as in consequence of the solidity of the old ball of soil the water fails to moisten it when surrounded by loose soil. The finest epacris are Coccinea major, crimson; Eclipse, red and white; Hyacinthiflora candidissima, white; Hyacinthiflora carminata, carmine; Lady Panmure, white and rose; Miniata splendens, crimson and white; Mont Blanc, white; Rose Perfection, and Rubra superba, purplish red.—P. P.

WELBECK ABBEY FROM THE SOUTH-EAST.

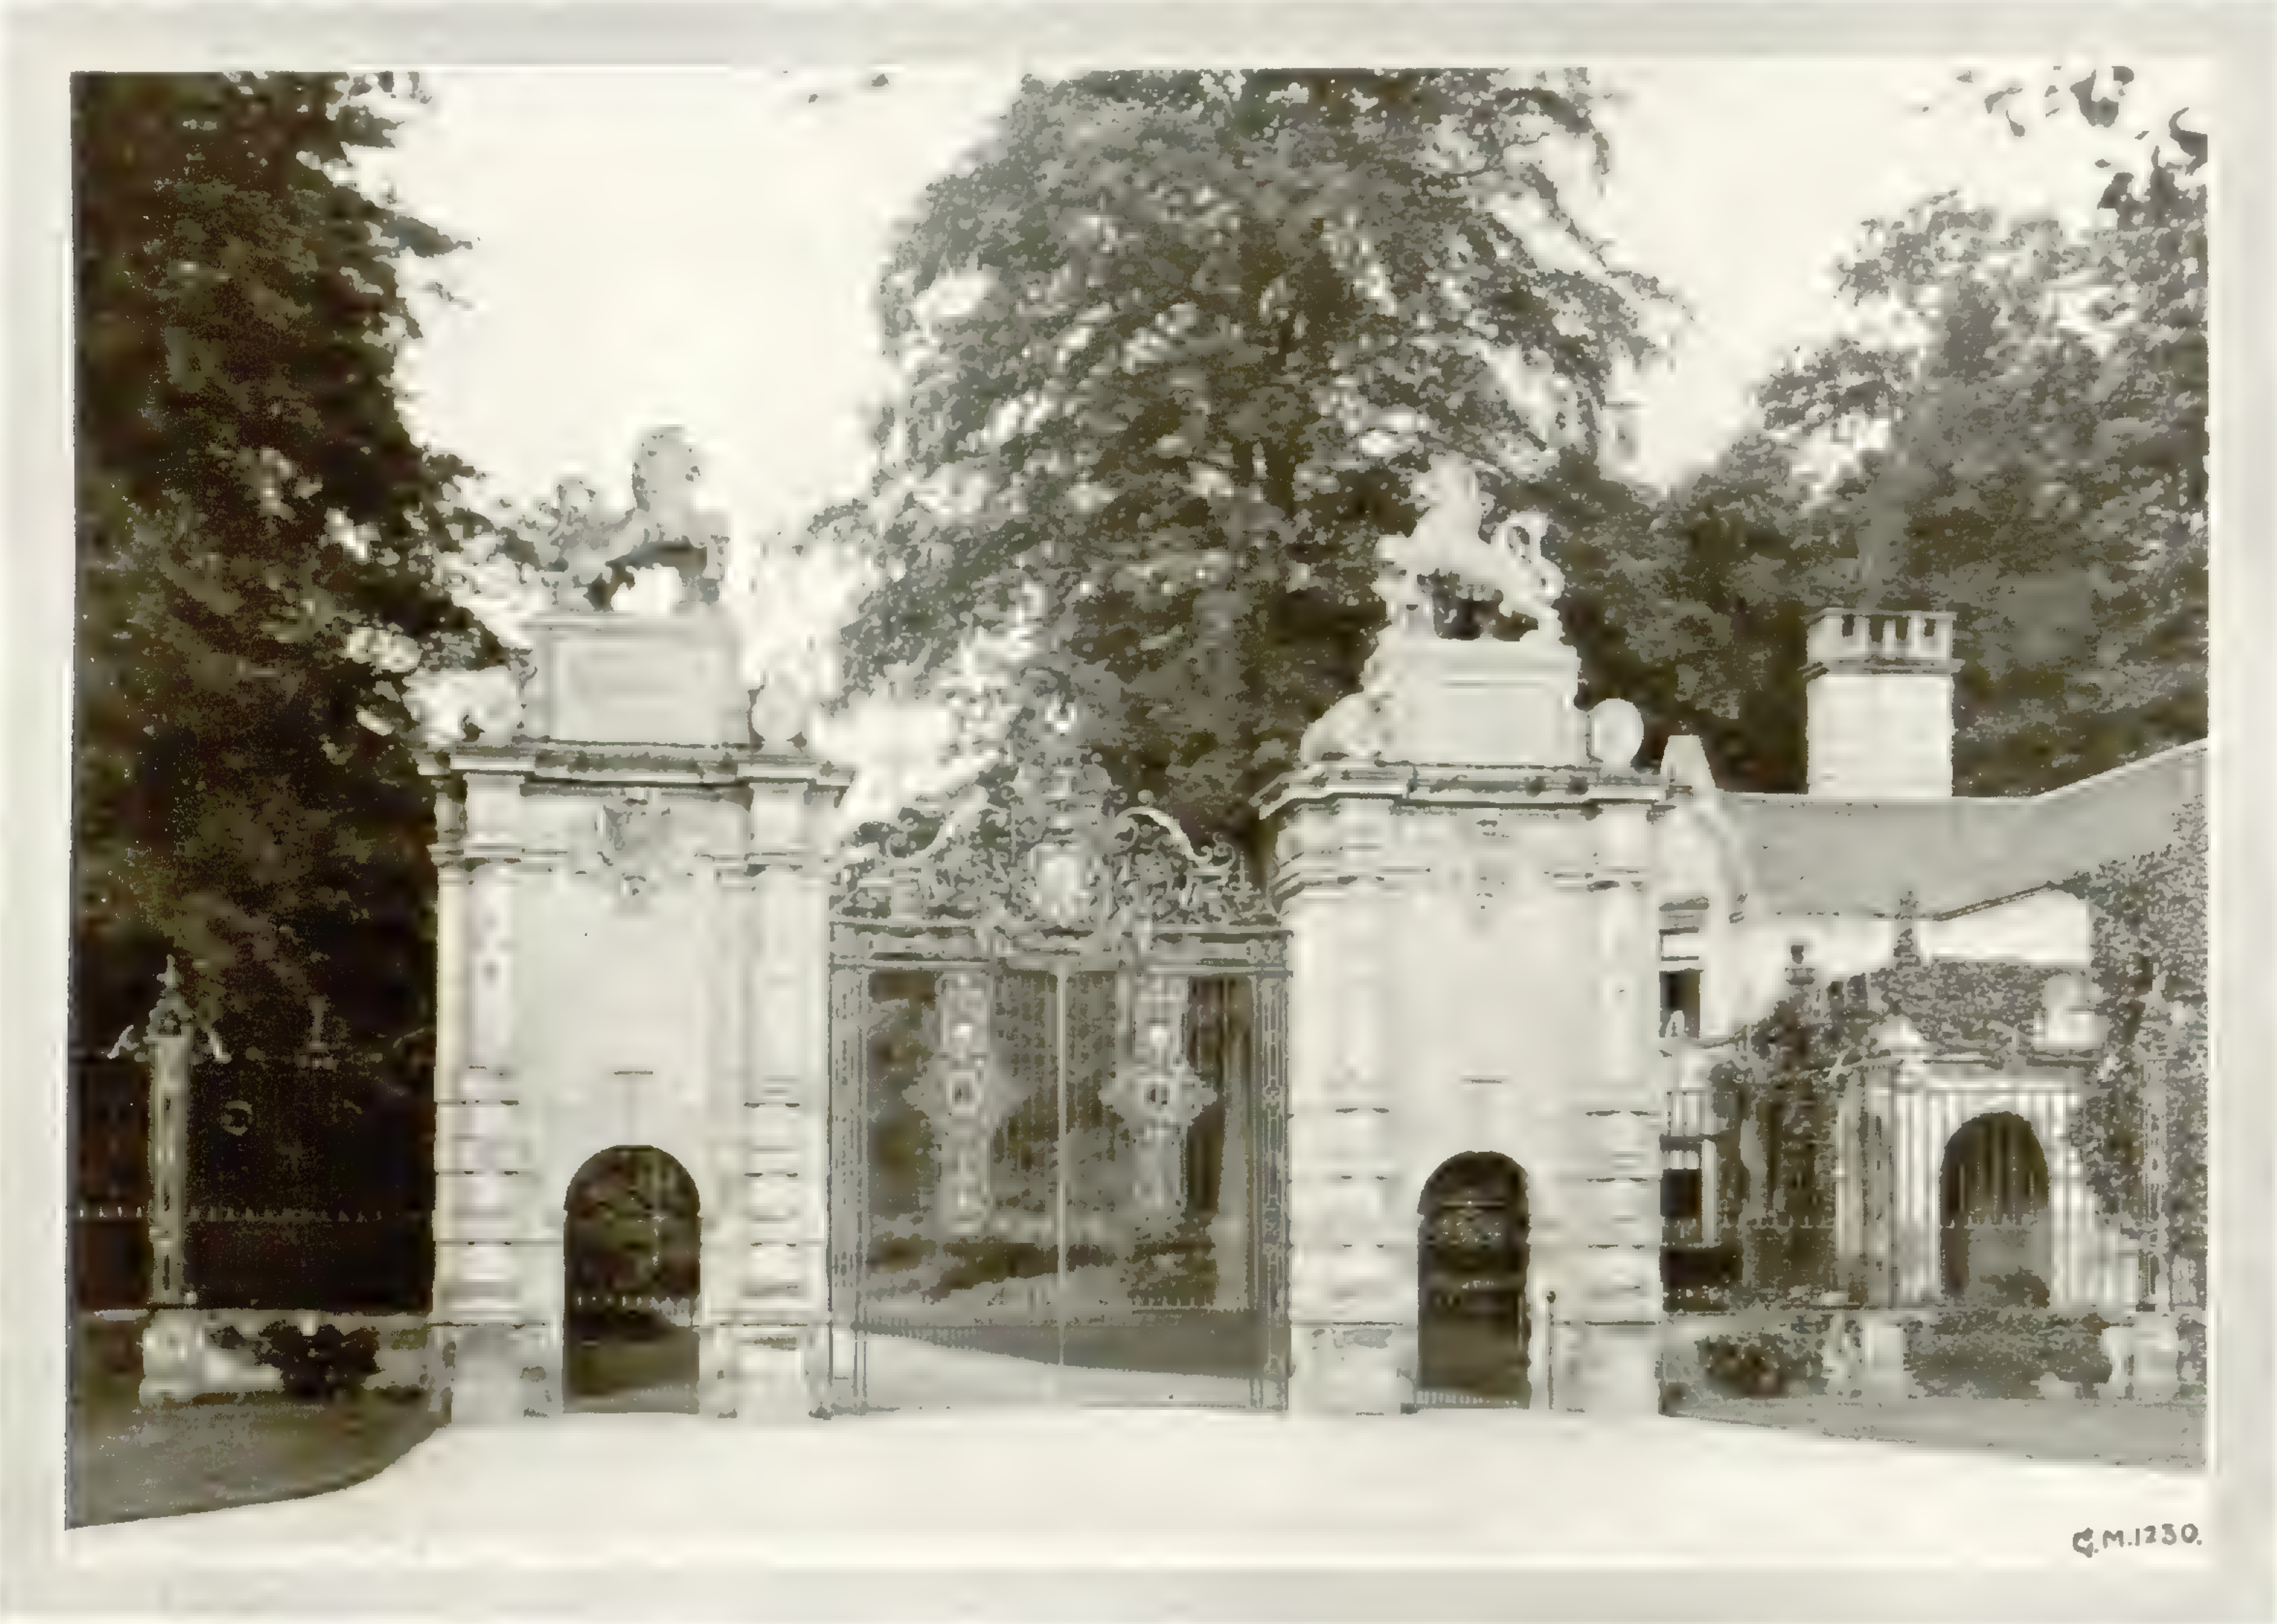
SOME GARDENS IN THE DUKERIES—I.

Sherwood Forest, so rich in traditional lore, and remarkable for its noble trees, more particularly oaks, originally occupied about one-fifth part of the county of Nottingham, and its boundaries extended from Newstead Abbey on the west to the town of Worksop on the east, a distance of about twenty miles. Its breadth varied from five to seven miles, and the area was about 95,000 acres; but at the present time a large portion, probably two-thirds, of this acreage is under cultivation. As much of the cultivated part is devoted to noble parks and rolling meadows, more or less finely timbered, the tract is remarkable for its distinctive beauty and arborescent charms, and is probably quite unsurpassed for its manifold attractions by any other similar tract in the United Kingdom. The forest of Sherwood belonged to the Crown from the reign of Henry II., long enjoyed a high degree of popularity as a Royal hunting ground, and, according to traditional lore, was the scene of the activities of Robin Hood and his "merrie men." It would not be without interest to refer to some of the traditions associated with this adventurous band, but the many matters immediately associated with horticulture that require attention most effectually prevents that being done. It may, however, be mentioned that on the west side of the forest there are traces of Robin Hood, one of the most noteworthy of these being the cave bearing his name cut out of the red sandstone rock, with primitive columns and arches. This is supposed to have been used as a stable, and southwards are some oaks associated with his name, one being known as "Robin Hood's larder," the supposition being that the large hollow trunk was utilised as a larder for the spoils of the chase. Within the original boundary there are many oaks of more or less interest for their vigour and splendid development, and others for their great age and the traditions associated with them; but as considerable space would be necessary to deal with them in a manner that would be at once interesting and useful, reference to them must be reserved for some future occasion.

The road connecting Mansfield with Worksop passes through a group of wide-spreading estates, and these, having originally had ducal owners, gave to the district the name of "The Dukeries." These domains occupy a part of the area in which the ancient traces of Sherwood Forest have been the best preserved. Certainly this part of the forest, with its magnificent trees, its great breadths of forest vegetation, its rolling meadows and noble parks, is rich in attractions, and it is not surprising that it should have become the home of several great families, or that it should be highly popular with the residents of Sheffield, and other of the large populous centres within a comparatively short railway journey. To those who enjoy the open country, with its manifold charms, a day amid the forest glades and wide-spreading parks gives an amount of pleasure that would be difficult to overestimate. Full advantage is evidently taken of the facilities which the Great Central Railway, with the judgment characteristic of its management, affords the dwellers in Sheffield and other populous centres on its system to visit the district at a small cost. In the forenoon large numbers may be seen leaving the Worksop Station for the various vehicles in waiting, and later in the day may be met with driving along the private as well as the public roads in the most joyous of moods. The more important of the seats are connected by broad grass drives, having a carriage-way on one side, with gates here and there to maintain their privacy, with locks, of which the several owners have keys. More delightful drives during the summer months it would be difficult to imagine; and it was especially gratifying to learn that owners of carriages and other means of conveyance resident in Worksop are readily given permission to use the private roads in driving parties of visitors through the district, a privilege that is much appreciated. I saw a dozen or more such parties driving along the private roads during the short time I was in the Dukeries, and they appeared not only to be fully enjoying the beautiful scenery, but were showing their appreciation of the kindness of the owners of the estates by respecting their property. With this short sketch of the characteristics of Sherwood Forest at the present time, it becomes necessary to give attention to the gardens of some of the more important of the seats that have given the distinctive name to the district, and the first to claim notice are those that form so glorious a setting to Welbeck Abbey, the Nottinghamshire seat of the Duke and Duchess of Portland.

Welbeck Abbey.

Welbeck Abbey is rich in historical associations, of special interest for its magnificent architectural features, and remarkable for the extent, beauty, interest, and high keeping of its gardens, which from time well nigh immemorial have been regarded as of commanding importance among the horticultural establishments in this country. However much they may have justified the high estimation in which they were held in former times, it is quite certain the justification was never so ample as at the present day. Both the Duke and Duchess of Portland appreciate to the full the pleasure that well-planned and highly kept gardens are able to afford, and it is evident they have not been sparing in time, thought, or money to make the gardens that surround their historic mansion as interesting and as attractive as possible. They have not been satisfied with the traditions of their gardens, and these are great, but have had them so modified and enlarged as to adequately represent the more advanced ideas of present-day gardening, and to have the glass structures and other buildings that belong to what may be described as the utilitarian part of the gardens so modernised as to ensure the highest degree of efficiency, and to afford those in charge opportunities of displaying their skill. This was the second time the writer had visited Welbeck Abbey, and as the first visit was paid some years previous to the recent improvements being made,



PRINCIPAL ENTRANCE TO PARK AND GROUNDS, WELBECK ABBEY.

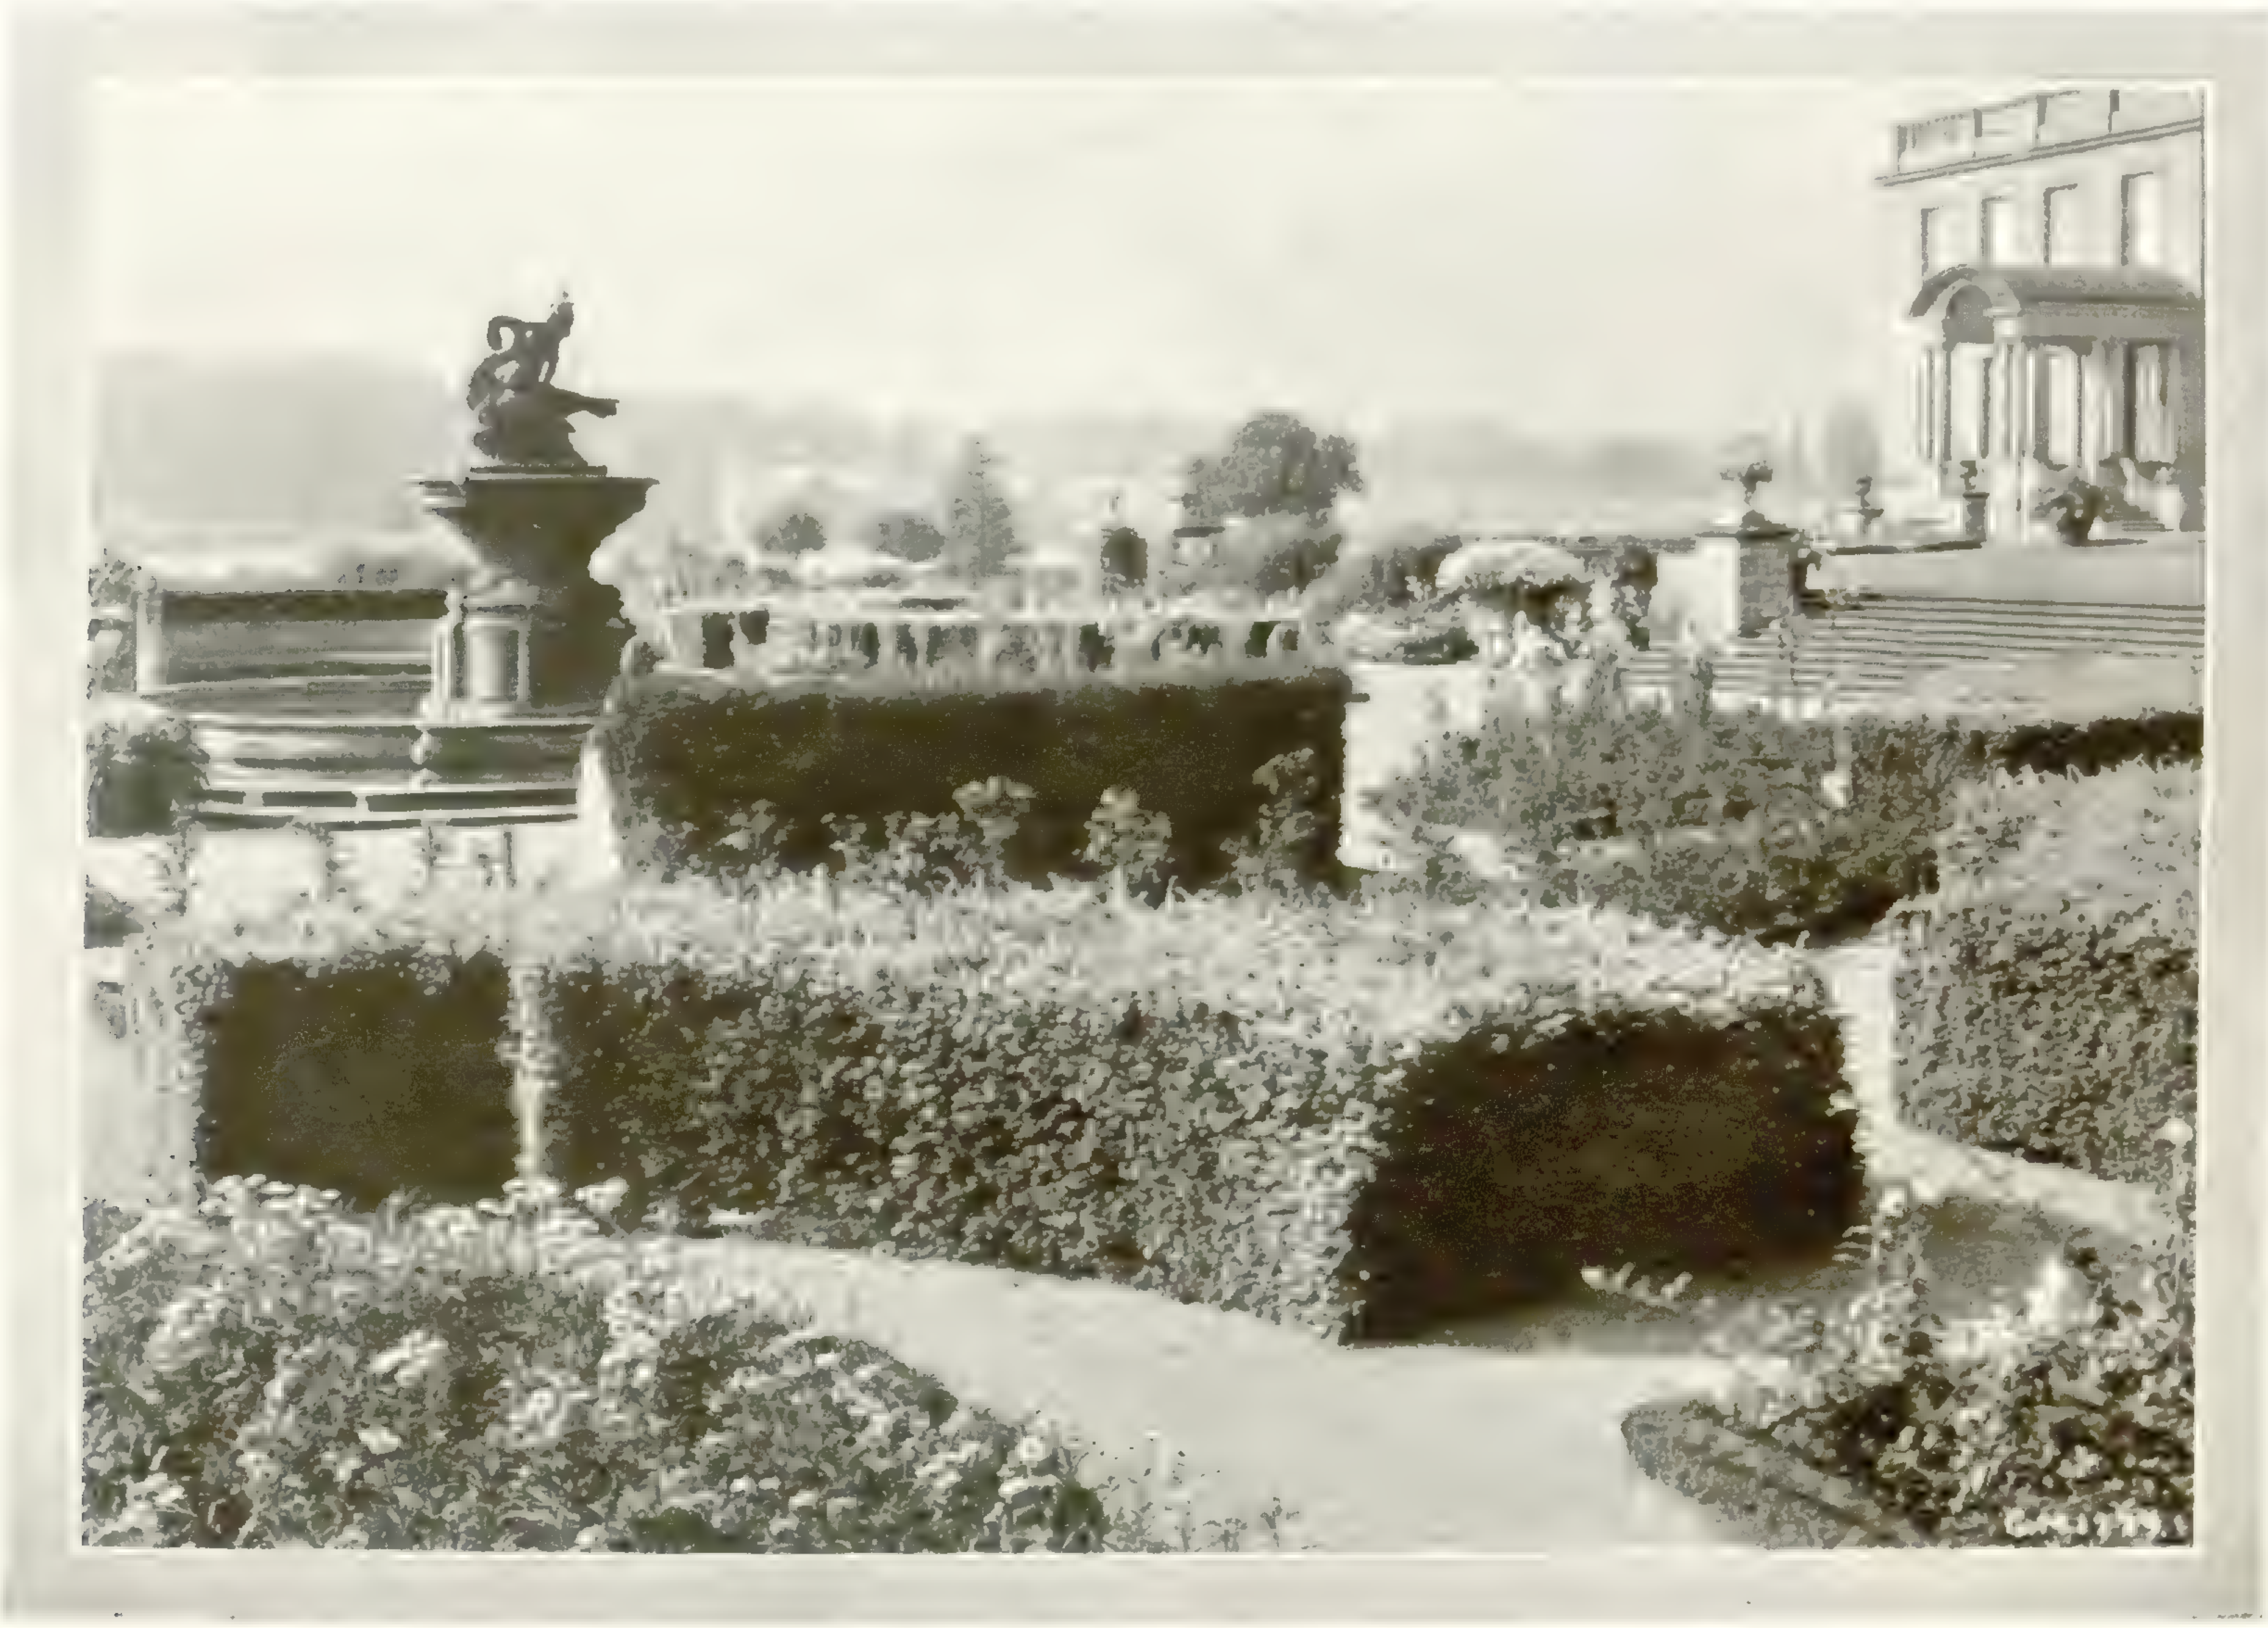
the transformation appeared little less than marvellous. Improvements have been many, but probably none have been of greater importance in the flower gardens and pleasure grounds than the remarkable extension of hardy flower culture. Next in importance probably ranks the increase in the cultivation of both dwarf and rambling roses. In the department devoted to the production of supplies of fruits and vegetables, the replacement of the older of the plant and fruit houses with structures of modern design at once attracts attention. It is impossible to visit the Welbeck Gardens without being impressed by their area, their beauty, and their many interesting features; but in sitting down to give a brief description of them the thought uppermost in the mind is that, as they are so varied, and the several features are on so vast a scale, a lengthened stay is essential to becoming sufficiently acquainted with their varied characteristics to do justice to them.

Welbeck Abbey, with its immense area of arable and grass land, and its magnificent tracts of woodlands, is situated about four miles from Worksop, and not far distant from the boundary of Derbyshire, and occupies a prominent position in one of the finest parks in England. The park is of immense extent, as evidenced by the fact that some of the lodges are four miles distant from the Abbey, and is remarkable for its noble oaks, splendidly developed limes, and magnificent chestnuts—the oaks being of special interest, for among them are several of exceptional dimensions and of considerable historic importance. It would be foreign to the object of these notes to give a history of the Abbey and its surroundings. But it should be mentioned as a matter of some interest that Welbeck was, previous to the Norman Conquest, held by the Saxon Sweyn, and that it subsequently passed to the Flamang family as part of Cuckney Manor. Here a grandson (Thomas de Cuckney) of Joceus de Flamang founded an abbey in the reign of Henry II., and effected a settlement of Præmonstratension or White Canons from Newhouse, Lincolnshire, their first home in England. The Abbey was dedicated to St. James and endowed with large tracts of land, and in 1329 the Bishop of Ely added to its possessions by settling the Manor of Cuckney upon the house. Two centuries later the Abbey at Welbeck was made the head of the order, and so it continued until, at the dissolution, it was granted to Richard Whalley, and subsequently it passed into the possession of Sir Charles Cavendish, one of the founders of the noble family by whom it is owned at the present day. By Sir Charles Cavendish the conversion of the Abbey into a noble mansion was commenced, and this work was continued by his son, Sir William Cavendish, who built the greater part of the structure. Need it be said that since that time the mansion has been materially altered and much enlarged. The more important of the alterations and improvements were effected during the past century; and, as already intimated, the great beauty of the gardens and grounds are largely due to the improvements that have been made within the past twenty years or so. The Abbey, as well-known, is unique in its magnificent apartments that are below the ground level and its underground approaches, that owe their origin to the constructive genius of the fifth Duke of Portland, who succeeded his father to the title and estates in 1854.

The Abbey is approached from various points of the compass, but the principal carriage drive is that which enters the park from the road that skirts the south-east side of the park and connects Worksop and Shireoaks Hill. The lodge gates at the entrance to this drive, which were erected in 1894, are bold in design, of great beauty, and in keeping with the stately mansion and the noble park. The finely carved pillars and lions by which they are surmounted are of white stone, and the gates are of hammered iron, the illustration affording ample evidence of their representing this art at its best. Need it be said that, in passing along this drive, several miles in length, a succession of views of surpassing beauty are obtained, but it should be mentioned as a proof of the strenuous endeavour made by the noble owners to beautify the surroundings of their fine seat, that great masses of flowering plants of diverse character have been formed in suitable positions alongside the drive where it intersects the woodlands. Near the Abbey much has been accomplished in the naturalisation of various bulbous plants, and the myriads of bluebells, daffodils, and a few other subjects that carpet the woods, must during the spring season produce a series of pictures of wondrous beauty.

The gardens and pleasure grounds which form a setting to the Abbey have so large an area, and include so great a diversity of features, that in a comparatively brief reference it is practically impossible to convey an adequate idea of their several characteristics. The magnificent lake, some three miles in length, constitutes a most interesting feature. Away to the south-east of the Abbey the lake is of great breadth, and, narrowing on passing to the east of the mansion, it curves northward, and for a considerable distance forms the boundary to the pleasure grounds to the north of the Abbey. That full advantage is taken of the opportunities it offers for the cultivation of moisture-loving plants goes without saying; but it must be mentioned that the weeping ash has been freely utilised in beautifying its margin. Usually we find the weeping willow exclusively used in fringing the margins of lakes and the banks of streams, and admirably adapted is the tree for the purpose; but the weeping ash, when planted some thirty or forty feet apart, is, as so well shown here, remarkably effective and pleasing.

The spacious terrace with its handsome



HEDGES OF GOLDEN YEW AND FLOWER BEDS ON EAST TERRACE, WELBECK ABBEY.

balustrade that extends along the east and south fronts of the abbey, is a quite modern addition, and adds immensely to the attractions of the gardens. On the east side the terrace is of sufficient area to allow of the formation of a geometrical garden of large size, and a considerable breadth of grass. On this terrace there is a magnificent fountain surrounded by formally cut hedges of golden yew, with spacious beds of roses, lilies, and various other subjects that find favour for flower garden embellishment at the present day. As an additional contribution to the attractions, Mr. J. Gibson uses rather freely finely grown specimens of hydrangeas and agapanthus, the majority being of immense proportions.

Not far distant from the east terrace, and on the north side of the mansion, is the rose garden, a comparatively recent addition to the grounds. This garden is somewhat formal in design, with beds in the grass, and is intersected by broad flagstone walks. On either side of the central path is a line of pillars of rambling roses which have now clothed their supports, and in their season produce a display of great beauty. Prominent among the ramblers are the well-known and highly appreciated Dorothy Perkins and Lady Gay. Of one of the lines of pillars I gave an illustration in the GARDENERS' MAGAZINE of October, 1909. Behind are the pillars and beds of dwarf roses, wherein are the finest of the hybrid teas and hybrid perpetuals, and these grow so vigorously, and bloom so profusely as to afford proof that they have the advantage of cultural skill of a high order. Contiguous to the rose garden are several large, well-developed Cedars of Lebanon, which add much to the charm of this part of the gardens.

Proceeding in a north-westerly direction through the grounds, the magnificent borders of hardy herbaceous plants are reached, and these unquestionably constitute an important, and certainly one of the most attractive, of the many features of the Welbeck Abbey Gardens. An illustration of them is given herewith, and, with its aid, the reader will have no difficulty in obtaining a clear idea of the general scheme without lengthy description. This much the illustration readily accomplishes, but fails, and necessarily fails, to convey an adequate idea of the marvellous effectiveness and surpassing beauty of these two borders. The whole area is so vast that they lose much of their importance, as do the plants, although arranged in bold masses, and rising in many instances to a height of eight, ten, or more feet. Foxgloves rising to the height of eight feet, and groups of delphiniums nine feet high were plentiful. The illustration of a portion of one of the borders that was given in last year's volume shows to great advantage the development of the plants, but necessarily it fails to give any idea of the scope of hardy plant culture as carried out at Welbeck, or of the manner in which the marvellous borders are arranged. It will be seen that they have been formed on either side of a broad space between two rows of limes that range from forty to fifty feet in height, and make a remarkably fine avenue. The borders have a total length of nearly a quarter of a mile, and a width of eighteen feet. They are interrupted in the centre by a circular space enclosed with a yew hedge, and provided with garden seats, and the opportunity thereby afforded for rest adds greatly to the enjoyment of the immense displays of flowers that are produced in the borders. At the extreme end of the avenue, and set some distance back from it, are pillars clothed from ground line to apex with Dorothy Perkins rose, which arrest attention immediately the resting-place is passed, and, as seen from a distance, they present during the season of flowering the appearance of a huge cascade of flowers and foliage. The borders are planted with the view to their being in their most attractive guise from the end of June onwards, and, as unremitting attention is paid to the removal of the flowers as they lose their beauty, the plants do not have their energies overtaxed by seed production, and they continue to bloom freely until the autumn is well advanced. Her Grace the Duchess of Portland takes the greatest interest in the arrangement of these magnificent borders, and the harmonious blending of colours is, Mr. Gibson informs us, wholly due to her great taste.

Beyond the avenue that encloses these hardy plant borders are coniferous and deciduous trees in great numbers, and among them are many of the more beautiful kinds in a high state of development. Not less remarkable are these, and, indeed, other parts of the grounds, for their wealth of evergreen and deciduous shrubs, and an enumeration of any considerable proportion of them would necessitate the preparation of a comparatively long list. Of special interest is the broad avenue of the richly coloured Retinospora obtusa aurea, of which a portion is herewith illustrated. This avenue follows the line of one of the underground roads leading to the Abbey, and the large, well-formed trees glow like burnished gold in the summer sun, and in the dullest part of the year their rich colouring lights up this part of the grounds in a marked manner, and brings into strong relief the great value of the golden coniferous trees in garden scenery.

Flowers are by no means confined to the pleasure grounds, and on entering the kitchen garden the visitor has evidence of this in the great borders of hardy flowers, the huge beds of carnations and roses, and the breadths of sweet peas. Here the attractions are many, and the gardener keenly interested in the utilitarian side of his work would have no difficulty in spending a considerable period without experiencing any lessening of interest. The kitchen garden is about a mile from the Abbey, and proportionate to, and in every way worthy of, a great ducal establishment. The area within the walls is twenty-two acres, and their total length two miles, and these are for the most part clothed with fruit trees that are in so fruitful a condition as to bespeak skilful management. With a full acquaintance with his successes as a cultivator of fruits and vegetables one might, to use a common form of speech, say that here Mr. Gibson is at home. It would, of course, be true, but it would not be a proper statement of the case, because Mr. Gibson is equally as much at home in carrying out the wishes of his noble employers in the flower garden and pleasure grounds as in the production of abundant supplies of high-class fruits and vegetables.

BORDERS OF HARDY FLOWERS AT WELBECK ABBEY.

The kitchen garden is connected with the Abbey by a drive that passes through it on the northern side, and immediately in front of the principal ranges of fruit houses. This road from its entrance to the department to its exit therefrom is six hundred yards, and on the left or north side there is a broad border devoted to hardy perennials, and on the right is a breadth of velvety turf on which are beds of dwarf roses and numerous pillars clothed with rambling roses—that beautiful variety Mrs. Flight being particularly noteworthy. Immediately in front of the glass structures are narrow borders filled with various flowering plants. This range of houses is divided in the middle by Mr. Gibson's handsome residence. Were one to attempt a detailed description of the glass department at Welbeck more space would be necessary than is occupied by the whole of these notes, and for the present purpose it will suffice to indicate the general features. A considerable amount of rebuilding has been done in the fruit department since Mr. Gibson assumed charge of the gardens, and a number of the vineries and peach houses in which may be seen heavy crops in their several seasons, were built by Messrs. Mackenzie and Moncur, of Edinburgh, and these splendid structures fully maintain the high reputation the firm has so long enjoyed.

There are a dozen or more vineries, several of which are wholly devoted to Muscat of Alexandria, Black Hamburgh, or Gros Colmar, and a few other of the varieties most in request. Some contain early varieties in association, and in like manner late varieties that succeed under the same conditions may be found in other structures. We need not further particularise varieties, except to say that Lady Downes, one of the best of the late black grapes, is extensively grown, a fact of some importance, seeing how frequently the handsome but indifferently flavoured Gros Colmar is allowed to occupy nearly the whole of the space available for late-keeping black grapes. The new vineries have, of course, been planted by Mr. Gibson, and some of the others have been replanted by him. The crops that are annually produced fully justify the course of procedure followed. One need not dwell upon the heavy crops of Black Hamburgh, the fine finish of the Muscat of Alexandria, or the points of excellence of other of the grapes, but it should be mentioned that Mr. Gibson appears to have a strong objection to having fruitless vineries, or to cropping young vines before they have sufficient strength to bear the burden of a crop. He accordingly utilises temporary vines, and plants two sets in addition to the permanent occupants. The vines forming one set are cropped the first year and then removed, and the second set comes into bearing and remains until the permanent vines are fully established and able to carry good crops. This practice, simple as it is, must result in an enormous addition to the grape supply where, as at Welbeck, the number of vineries is large.

The structures devoted to peaches and nectarines, to figs, to cherries, and to pot fruit trees are numerous, and not less interesting than are the vineries; but there is no occasion to particularise, and to indulge in praise would be superfluous. Note was made in one house of trees only two years planted that were carrying heavy crops, but a practice is made of so preparing trees on the open walls that they can be used in replacing those under glass without their suffering an appreciable check in the operation. It may also be mentioned with advantage that, in the cultivation of figs, to which several houses are devoted, the roots are kept somewhat confined, and water rather sparingly used, with the result of the crops being heavy and the flavour of the highest excellence. In addition to the fruit houses of the usual character, there are several glass cases. One that has a length of two hundred and fifty yards has peaches and nectarines trained over the back wall, and cordon cherries and plums in the front; another with a length of four hundred and twenty yards contains apricots, plums, peaches, and nectarines. These are unheated, and large supplies of fruit are obtained from the trees which have their home within them.

Chief among the more notable additions that have been made to these gardens within recent years are the numerous span-roof plant houses that have been built in the north-east corner of the kitchen garden. These are forty or fifty feet in length, and of a height and width best suited to the cultivation of the various classes of plants suitable for decorative purposes, and, indeed, for various other choice subjects. They are arranged in a block, and parallel to each other, and connected at the north end by means of a broad corridor, herewith illustrated. The length is ninety-six yards, and sixteen feet wide and twelve feet high. This corridor serves a double purpose; in the first place, the plants can be carried from one house to the other, and from the glass structures to the potting shed, without their being taken outside, a matter of no small importance during the winter and spring months. In like manner visitors can pass from one house to the other without their having to be exposed to outdoor conditions before they have completed the tour of inspection. The second purpose is the display of flowering and foliage plants of decorative size. The illustration shows how fully the corridor is taken advantage of for this purpose, and how attractive are the displays that are produced. This fine block of houses, with their connecting corridor, were built by Messrs. Messenger and Co., of Loughborough, and heated by two steel Cornish boilers. The arrangements for the water supply are excellent; the rain water is collected in tanks, and from these it is, with the aid of a gas engine, pumped up into a tank eight or ten feet above the ground level, and from this it passes by gravitation through the houses.

A FINE AVENUE OF RETINOSPORA OBTUSA IN THE WELBECK ABBEY GARDENS.

The fruit houses also are heated by two Cornish boilers, and to allow the fullest freedom in regulating the heat, the mains are carried under the road that runs along in front of the houses. One would be sufficient, with additional stoking during severe weather, but Mr. Gibson prefers to have a reserve, and to be placed in a position that renders the driving of fires unnecessary.

In walking through the kitchen garden it is seen that all the principal vegetables are grown on a large scale, as for example, an area of an acre or more being devoted to asparagus. Note also is made of great breadths of sweet peas, and big beds of carnations and roses, these presumably being grown for the supply of cut flowers. Another noteworthy feature of the department is the fruit arcade, two hundred and fifty yards long, over which apples are trained, and bear well. So one might continue, but the limits of space have been reached, and these notes must at once be brought to a close.

George Gordon.

⁂ The second portion of the account of "Some Gardens in the Dukeries" will appear in our issue of June 18. There will be a large number of illustrations accompanying the description of the gardens at Clumber, Thoresby Park, and Rufford Abbey.

Hippeastrum pratense.—This was originally named Habranthus pratensis, and as such it is still generally met with except in botanic gardens. Compared with the present-day garden varieties of hippeastrum it is a quite tiny flower, but at the same time an exceedingly pretty one. The flower spike, which is fairly stout, reaches a height of a foot to eighteen inches, and bears two to four flowers of a bright scarlet colour with a greenish centre. It is a native of Chili, from whence it was introduced by William Lobb in 1840, and it first flowered at Exeter two years later. In a state of nature this hippeastrum is said to often occur on the sides of mountains, and under cultivation in this country it is hardier than most members of the genus. It will often succeed if given much the same treatment as the Belladonna lily, that is, planted in good loam in a well-drained border and in a warm, sheltered spot. I am not aware that this hippeastrum has ever been employed by the hybridist in the production of new varieties, but for its own intrinsic merit it is a plant well worth growing. It was recently shown in good condition at the Temple Show.—W. T.

CREEPING COTONEASTERS.

There are three cotoneasters or rock-sprays—as they are familiarly spoken of—that are quite indispensable for furnishing rock gardens and similar positions. The great merit, common to the group, is that they follow the contour of whatever surface they come in contact with, be it soil or rock, and so it frequently happens, when the site is particularly rugged, that these entirely merit their common name, as the stems and branches issue from the rockwork in the most fantastic forms, and when in flower are floral rock-sprays in fact. Cotoneaster adpressa is a comparative newcomer, the young stems are red, and are clothed with small oval box-like leaves, which are deciduous; the leaves take on a ruddy purple colour in autumn, and remain on the plants until December. In this species the stems are not quite so susceptible to surface contact as in C. congesta, the garden name by which C. microphylla glacialis is known; in this subject we have one of the finest rocksprays, the young stems are bright red, and clothed with rich evergreen foliage, which exhibits great diversity of colouring, according to the season; in spring, light bronzy-green, and in autumn and winter of varying shades of purple; so closely do the stems follow the surface that it forms the most perfect replica of whatever it creeps over. Cotoneaster rupestre completes the group. In habit it resembles the last-named; the leaves are dark green in colour and rarely vary, except when in a young state; they are more or less margined by a soft whitish tomentum. Of the trio it produces the most conspicuous flowers, which resemble those of the hawthorn on a very small scale, and crowd the branches in immense numbers during May and June. These cotoneasters succeed in ordinary garden soil, and reach their highest development in positions fully exposed.

Walmsgate Gardens. Thomas Smith.

SPINACH.

There are two distinct varieties of spinach, namely, the smooth-seeded and the prickly-seeded. They are distinguished chiefly by their different periods of growth, the former being generally classed as summer spinach, and the latter, or prickly-seeded, as winter spinach. There is no easier vegetable to grow on ordinary good garden soil, but the best crops are usually secured on soils of a moderately light texture, sowings of the summer varieties being made at intervals of ten days from March to the end of June, and of the winter kinds in August and September. The vegetable itself is generally well appreciated for culinary purposes; most people find it decidedly appetising when made up in one of the many tempting and agreeable dishes, and there are few who are quite averse to it.

CORRIDOR TO NEW PLANT HOUSES, WELBECK ABBEY.

One or two advantages connected with this particular culture should commend themselves more generally to amateur growers and others. The crop has much general utility, it makes a rapid growth, it is not liable to disease or insect attack, and the winter spinach provides a large bulk of foliage for gathering in the winter months, when there is usually a great scarcity of greenstuff. And even from these same plants a still greater amount of green can be secured as soon as the warmer days of spring advance. Of varieties, Victoria, or Long-standing, is a useful summer or round-seeded kind, and enjoys the additional advantage of not seeding until a fortnight after other sorts. New Zealand also produces a wealth of green succulent herbage in summer; this variety should be sown in February, in heat, and transplanted in June. Sutton's Long-Standing Prickly is a good winter spinach.

Deep digging and liberal manuring is essential for both kinds. For the summer varieties the ground should preferably be somewhat moist, otherwise there is a necessity for frequent waterings. Sometimes it is advisable to choose a warm, protected border for the earlier sowings, the drills being rather shallow, say, about one inch deep, and the seeds inserted at a distance of from twelve to eighteen inches apart, according to the variety sown. One foot will, however, be ample for the round-seeded varieties, but for the winter kinds, which develop a more luxuriant growth of foliage, more space will be needed. The latter are also sometimes broadcasted in four or five feet beds, one foot apart. Whenever practicable the seed should be sown just previous to a shower of rain or immediately afterwards, as germination will then be accelerated, and a better "plant" secured than when continuous drought prevails. If the weather is inclined to be dry it will be advisable to give a thorough watering to the drills before sowing; some growers even steep the seed in water for some five or six hours previously. In the latter case, however, there must be no lack of moisture afterwards.

Successional sowings may be made up to June, and, as the summer crops soon run to seed, it will be advisable to carry these sowings on as far as the month of August in order to ensure a constant supply. In the same month, and in the beginning of September, the winter kinds may be sown, and for these the warmest situation should always be chosen. In this way the young plants will be afforded the greatest possible amount of sunshine, which will enable them to become thoroughly hardened for the rigorous weather they will have to withstand later on. These sowings will, of course, depend largely upon the season and locality. A practice with many growers, and one that seems to answer very well in rich soils, is to sow summer spinach in a single drill between rows of peas or beans.

The after-cultivation of spinach consists of thinning out the seedling plants as soon as they have made three or four leaves. The plants should then be left about two inches apart in the rows, and when at a more advanced stage of growth they may be still further thinned out to about six inches apart in the rows for the summer kinds, and nine inches for the winter kinds. Or, as an alternative, a first gathering may take the place of the second thinning, every other plant being afterwards cut out. Plenty of moisture is required by this crop in dry weather, and every care should be taken to keep the ground well stirred between the rows. When gathering, the largest leaves should be cut first, leaving the yet undeveloped foliage to come on in succession. The plants must not, however, be entirely denuded of their foliage, as, if this is done, they cannot continue in a robust and prolific growth. Regular gatherings are essential, as this promotes the health of the plant. In the summer months the plants may be cut close to the root.

Old Basing. J. C. Newsham.

Insect Depredations in Forests.—According to a recently issued bulletin, very extensive damage is done to the trees in the North American forests by insects. Dr. A. D. Hopkins, the officer in charge of Forest Insect Investigations, estimates the loss due to insect pests at 1 per cent. annually of the total stand of merchantable timber of the United States, this being equal to a total loss of about £13,000,000. One of the most destructive of the pests is the large larch sawfly (Nematus Erichsoni), which has of late been doing considerable damage to larch plantations in this country.

THE CULTURE OF LATE PEAS.

To what date the season of garden peas may extend, depends a very great deal upon the climatic conditions that prevail during late autumn. With ideal weather and the best possible culture, together with suitable varieties, peas may be obtained up to the end of October, and sometimes later. It is, therefore, advisable to make late sowings in the hope of these perfecting and producing a few dishes of this ever-popular vegetable.

To produce late peas at their very best, it is most essential that their cultural requirements be well looked to, as unless strong and vigorous haulm is formed it is hardly reasonable to expect anything like satisfactory results. Therefore every means should be directed towards producing a healthy, free growth that will render the plants less susceptible to the attack of insect and other pests. Every gardener endeavours to produce an unremitting supply of peas over as long a period as possible, and makes frequent sowings in various sites from now until the end of June.

The preparation of the ground, as I have previously hinted, is a most important item. No crop pays better for good cultivation than peas, and when this is given the ensuing crop also reaps additional benefit. Deep cultivation is necessary, and a thorough enriching of the soil with decayed manure. I practise, and strongly advise, the formation of trenches similar to those prepared for celery, as by adopting these means, the plants may be much more copiously supplied with water, if this is necessary. Take out the trenches, if possible, some little time before the time of sowing, and fork up the bottom well; treat liberally with rotten manure or other decaying vegetable refuse, turn back some of the finest of the soil, and leave a good tilth on which to sow the seeds. If the seeds appear to be satisfactory avoid overcrowding, which is a common practice, I fear, with many growers, and one which does much to foster attacks of mildew, owing to the starved conditions that must necessarily follow. One must, however, remember that there are many pests with a particular liking for these seeds, and it is always possible to thin the seedlings when well above ground.

When the plants attain a height of three inches or thereabouts, they should be staked in a secure and workmanlike manner, with suitable cut sticks, according to the height they are likely to grow. Mulching is another important item of a dry season, and does much to minimise labour in watering, as well as greatly benefiting the crop. This is best supplied when the ground is moist, and not omitted until the soil is thoroughly parched up. When the plants are growing freely, stimulants are readily absorbed, and should be applied at intervals, but never when the ground is in a dry state. Farmyard liquid manure, properly diluted, is very nourishing, and this can be varied by occasional applications of a good artificial vegetable manure, and dustings of soot, which will prove most effective in showery weather.

Under good conditions insect pests are not, as a rule, troublesome, although mildew is sometimes prevalent, and, in some seasons, more so than others. Birds soon play havoc, especially hawfinches, and must be kept at bay. Mice are troublesome when the seeds are sown, and traps must be set, or the seed steeped in a mixture of red lead, and guards or cotton should be placed over the rows to keep birds away. Varieties are numerous, and each firm has its own particular favourites; localities alter the cropping properties of varieties in a marked degree, and I would therefore advise those who know a good late pea, suited to the locality, to stick to it. Two excellent varieties that can be generally relied upon to produce good results are Autocrat and Masterpiece. E. Beckett.

Aldenham Gardens.

EELWORMS.

Eelworms or nematodes in garden and greenhouse soil constitute a serious and troublesome pest for which it is extremely desirable to find some simple and practical remedy. Experiments on various methods of destroying eelworms have been carried on for many years by Dr. G. E. Stone, of the Massachusetts Experiment Station, says the "Weekly Florists' Review," and a recent report of that station gives some of the practical results of these experiments.

Doctor Stone points out that the use of lime is advocated for destroying the eelworms, but his experiments show that lime has little or no value for this purpose. In fact, it was found possible to keep eelworms alive for several days in a saturated solution of limewater. He considers: "Undoubtedly the application of lime to greenhouse soil improves it by modifying its acidity, but eelworms will thrive in soils which are not acid."

The use of formalin has been recommended, but the experiments at the Massachusetts Station indicate that this is not effective in killing the worms, and besides cannot be used on soils containing growing plants on account of the injury likely to result to the plants.

"Of late years formalin has been recommended as a remedy for eelworms in violets. This is used by applying it to holes made in the soil where the plants are growing. The formalin being volatile, the gas penetrates the soil, and is said to kill the worms. Our experiments with it would not seem to warrant the use of this method of treatment, as formalin is injurious to plants, and there is reason to believe that it would not affect in the least the eggs of eelworms, which are fairly well protected by a resistant covering," says the report.

The methods used with more or less success at the Massachusetts Station for destroying eelworms in greenhouse soils were as follows:

Sterilisation.—This is one of the cheapest and best methods of destroying eelworms in greenhouse soil. It is necessary that the soil be heated to at least 180 degrees, and a higher temperature is better. This is accomplished by driving steam through the soil by a system of perforated pipes.

Freezing.—If the soil is frozen for any length of time the eelworms are destroyed, and some use has been made of this method by practical growers. As a rule, the soil is removed from the house and frozen in bulk out of doors.

Desiccation.—Drying the soil is destructive to eelworms, but it is difficult to dry soils sufficiently in deep benches to make this method effectual. The application of unslaked lime, however, will materially aid in drying the soil, by virtue of the water-absorbing qualities of the lime.

Trapping, or the catch-crop method.—It has been found in Germany that sowing very susceptible crops, like mustard or rape, on soil contaminated with eelworms, and, after the females have become encysted in the roots, pulling up the plants and exposing them to the drying rays of the sun, is capable of reducing the worms to some extent in contaminated soils. We have found, however, that two or three catch crops are much better than one.

The Massachusetts experiments indicate that in some instances simply flooding the soil may prove a successful means of destroying the eelworms, and that manure infected with eelworms may be safely used on garden and greenhouse crops if left for a sufficient length of time in water.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

GENERAL REMARKS.—The cold nights which were experienced during the spring and the sunless weeks during the month of May, have not been favourable to growth, and consequently most of the plants are some weeks later than usual both in the production of growth and in their flowering season. I understand these remarks may be applied generally throughout the country, therefore those in charge of plants must endeavour to counteract those retarding influences which necessarily follow a long season of unfavourable conditions. A great deal may be done by the discreet use of artificial heat, by keeping the temperature slightly above the normal at night, and during the day time making use of all the available light. During late years the summers have been all to short for the benefit of cattleyas and other orchids which derive so much benefit from sunlight, and there has consequently been a tendency to produce soft or sappy growths, and the plants not only fail to display the best qualities in their blooms, but their constitution is undermined and they are thus the more prone to disease and insect attacks. Even in situations most favourable to the cultivation of orchids these disadvantages are severely felt, and the detrimental effects are far more serious in the unfavourable surroundings of large towns and smoky manufacturing districts.

SHADING.—After a period of dull weather sudden changes to bright sunshine are not always advantageous to the plants, especially in the cool divisions. It is advisable that the permanent shading should now be put on the roof glass. This may be done by spraying with a syringe or by means of a whitewash brush; we find whiting mixed in churn-milk or ordinary skim-milk, with a little salt added, to be the most serviceable shade for this purpose. There is a very considerable advantage derived from permanent shading on all the divisions, but for cattleyas, dendrobiums, and other light-loving plants, only a thin sprinkling is necessary, just sufficient to reduce the scorching effects of the sun early in the day before the blinds are required. It also enables the operator to raise the blinds earlier in the day, thus affording additional light and raising the temperature after the houses have been closed. This also means a reduction of artificial heat.

DAMPING must now be carefully attended to. Dry atmosphere and other unfavourable conditions give every encouragement to insect pests, and also retard growth of practically all the epiphytal orchids. Ventilate freely whenever the outside conditions permit, but care must be observed to prevent draughts coming in direct contact with the plants. On warm nights a little ventilation should be put on the leeward side of the house to keep up a free circulation of air.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

SOUVENIR DE LA MALMAISON CARNATIONS.—The main batches of these plants are now fast approaching their flowering stage, and it will be necessary to see that the bands by which the flower stems are tied are not too tightly fastened, otherwise the stalks will snap as growth develops. Remove the lateral flower buds as soon as possible, and also afford the blooms requisite support before they have fully opened. The Ascott is one of the best supports for this purpose, and it can be procured in various colours to suit the different varieties. Shade the blooms from strong sunshine or they will quickly lose their colour. Keep the house cool, and well ventilated, and on very hot days damp the staging between the pots as well as the floors. Plants that have passed out of bloom should be placed out of doors to harden the young growths before layering commences.

LONICERA SEMPERVIRENS. — For training up the rafters of a cool greenhouse or covering a sunny wall in the corridor or conservatory, few plants are more suitable than this lovely North American honeysuckle. The terminal clusters of trumpet-shaped flowers, which are produced in spring and on through the summer months, hang in great profusion. The flowers, which are a brilliant shade of orange-scarlet, with yellow interior, contrast well with the leaves. When growing freely this climber should be supplied with copious waterings, and occasional applications of liquid manure, and be kept free from attacks of red spider.

PRIMULAS.—The secret of success in primula culture lies in steady and continuous growth throughout the whole period of their development. They must suffer no check through drought or an excess of water. If repotted before they need it, or left in small pots too long, or allowed to remain in a position that causes the foliage to become drawn, trouble is sure to follow, and when once primulas have received a check they do not readily recover. Extremes of temperature should be avoided. Coolness in summer is desirable, and when established the frame lights may be removed from them at night so that the dews may refresh them. Just enough warmth is required in winter to keep the roots active. Some growers, with a view to producing large specimens, sow seeds in September. But for a main batch March is early enough, and, if careful attention is given the plants, they can be had in the best form by November and onwards. Now that pits and frames are capable of affording ample room there is no need for overcrowding the plants.

AZALEAS.—These should be examined, and if potting is needed, carry the work forward without delay. Those that do not require potting should have the drainage examined in case it has become clogged. Azalea mollis should now be planted out in a shady, moist piece of ground where they will not lack water.

PITS AND FRAMES.—Most of the bedding plants will have been removed out of doors, and thus ample room will now be afforded for begonias, celosias, salvias, petunias, etc., all of which will be required during the next few months in the conservatory. The frames should be made thoroughly clean and be closed early in the afternoon. Use the syringe freely to create atmospheric moisture.

WATERING.—Water is one of the chief necessities of plant life, and success in plant culture very largely depends on the discretion that is shown in determining the quantity of water required by each plant. To serve all plants alike is a bad practice, but a common one in some gardens during busy times. Newly-potted plants should be given a good soaking to settle the soil about the roots soon after the operation; but following this, only a moderate quantity will be required until the roots have permeated the new soil, and when plants have filled their pots with roots care must be taken that they do not suffer from lack of water.—W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

HARDY PERENNIALS and similar fast-growing border plants now require a good deal of attention; suitable supports should be given, tying the growths loosely but securely. Avoid bunching the growths together, as is so often practised by the careless and indifferent workman as an excuse for getting over the work quickly at a time when other work is pressing. Watering will be needed by all plants that have been planted this season. On no account allow these to suffer from drought. All bare places in the herbaceous borders should be filled up with suitable plants without delay, and there is no branch of flower gardening with a wider range for the display of one's ideas than the mixed herbaceous border, which never fails to produce a feeling of interest and enjoyment the season through.

ROSES growing in raised beds or on sloping borders require a mulch on the surface much more than beds on the level; half-decayed manure is undoubtedly the best material to use, the plants being benefited by the manurial matter washed down to the roots by rain, and the soil will be kept in a more uniform state of moisture, which, in the case of newly-planted roses, will greatly assist the roots to establish themselves in their new quarters. If manure cannot be had, or its presence would be considered objectionable, a very good substitute may be found in half-decayed leaves, or cocoanut-fibre refuse; either of these will prevent a too rapid evaporation of moisture from the soil. In light or naturally well-drained soils the beneficial effects of liquid manure on roses at this time of the year is shown, not only in the increased vigour of the plants, but an increase in the size and colour of the blooms. Many of the artificial manures now sold may be applied in a liquid state, but care must be taken to apply these at the correct strength, or in a weak solution and often, rather than overmuch at any one time. For syringing purposes, and a check to green-fly, clear soot water is an excellent thing to use.

LILIUM TIGRINUM and others of similar growth will require staking and tying as growth increases, otherwise serious damage might accrue with the advent of high winds or heavy rains. Where needed, a mulching of decayed manure might be given these, and during a spell of dry weather careful attention should be given to watering, especially if they are showing the least signs of distress.

DAHLIAS may now be planted out, unless the weather be distinctly unfavourable. Care should be taken to see that these are sufficiently moist at the roots before turning them out of the pots. If the soil is inclined to be heavy and cold a portion of prepared light rich soil should be placed immediately around the roots, as this will materially assist in giving the plants a quick start. If, as is now usually the case, the plants have been grown in six-inch or eight-inch pots, and the consequent top growth is sturdy, and several inches in length, it will be necessary to stake the plants as planting proceeds, but take care that the tuber is not pierced by the point of the stake, or losses may occur.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

STRAWBERRIES.—The plants are flowering profusely, and there are every indications that good crops will be general in this locality; this season the flowering period was late, and so no damage to the flowers has resulted from frost. All weeds should be removed from the plantations, and the work of protecting the fruit with fish netting should be done at once. Strong stakes should be driven into the ground twelve feet apart, leaving them about three feet above the level of the soil. Some long strips of two-inch quartering will be required to nail upon the top of the stakes, so that the nets can be placed over them. This entails a little trouble in the first instance, but one is amply repaid for the labour thus involved by being able to have free access to the plants at all times, both for thinning the flower trusses, and gathering the fruit. If large fruits are desired for dessert, the fruits should be moderately well thinned as soon as they have set; applications of liquid farmyard manure are beneficial for the production of finely developed well flavoured fruits, but the liquid manure should be applied at some little distance from the plants, so as not to come in contact with the fruit, or the flavour will be impaired. Plantations made late in the past spring should have their flower trusses removed to ensure good strong fruiting plants for next year. Varieties such as St. Antoine de Padoue and St. Joseph should have their flowers removed, as this will ensure good crops of fruit late in the summer, when the perpetual fruiting varieties are appreciated for dessert.

TREES ON WALLS.—It will be necessary to give constant attention to all fruit trees grown on walls; the final disbudding of the young shoots on all trees that require it should be finished as soon as possible. These remarks apply particularly to peach, nectarine, and Morello cherry trees. It is a common mistake to leave too many young growths, and, consequently, it is impossible for the wood to develop and ripen; the young growths should be disposed over the trees, so that the sap may become equally distributed, and promote healthy, well-developed wood. To form a well-balanced tree all young growths should be carefully tied in before they become too long. Many of the stone fruits will require to be gradually thinned, but defer the final thinning until the stoning process is well advanced. Shoots that are required for extension, on figs, sweet cherries, and apricots, should be made secure, at the same time laying in young growths their entire length to fill up vacant places, or to replace useless branches; all other shoots should be pinched at three or four leaves to form fruit spurs. The trees should be kept free from aphides, black-fly, and red spider; syringing the trees during favourable weather with clean tepid water, applied forcibly with the garden engine, will greatly assist in keeping them free from these pests. Up to the present time it has not been necessary to water trees grown against walls with clear water, but at the same time the borders should be carefully examined, and if found to be at all dry a good soaking of clear water should be given. Where figs have set their fruits well they will soon require copious supplies of water at the roots.—Henry R. Farmer, Cardiff Castle Gardens.

THREE GOOD BEDDING CALCEOLARIAS.

The calceolarias of tall growth are extremely valuable for bedding purposes, and the decoration of the flower garden in summer, and it will be noted that they are allotted prominent positions in the London parks and gardens. Calceolaria amplexicaulis has sulphur-yellow flowers and light green foliage, and the effect produced by it is altogether soft and pleasing. I would advise that it be associated with Salvia patens, with lilac or purple-flowered violas as a carpet.

C. Burbidgei is a bold variety, with ample foliage and fine golden flowers, and, as seen in large specimens, is exceedingly effective. I noted a very large bed last season tenanted by plants arranged four feet apart, Verbena Defiance, brilliant scarlet, doing duty as a carpet plant, while Verbena Blue Perfection formed a wide belt and framework, the whole making a strikingly effective combination.

C. integrifolia makes a fine bush in the open garden in South Devon, but I am afraid that it would come to grief in any other than similarly favoured parts. It produces large branching panicles of rich golden yellow flowers, while the foliage is distinct, being firm in texture, with a roughened surface. Plants from six-inch pots and about two feet in height develop into effective specimens by the beginning of August, but two-year or three-year-old plants, cultivated in large pots and plunged, are vastly preferable.

Walter H. Aggett.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box. 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY. 22nd Annual Show. SOPHIA GARDENS, CARDIFF. WEDNESDAY and THURSDAY, July 20 and 21st, 1910. Liberal Prizes in every section, amounting in money and plate to nearly £500. Two Programmes of Music each day by His Majesty's renowned 1st Life Guards Band. A Grand Display of Fireworks each evening by Messrs. W. and J. Wilder, Birmingham. Mr. John Studts up-to-date Fun of the Fair, each day. Tents lighted by the Blanchard Patent Incandescent Oil Lamps. Popular prices. Tickets and Schedules may be obtained from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

COVENTRY AND WARWICKSHIRE
HORTICULTURAL SOCIETY.

GRAND EXHIBITION,
PLANTS, FLOWERS, FRUIT, & VEGETABLES,
AT THE CRICKET GROUNDS, BUTTS, COVENTRY,
WEDNESDAY and THURSDAY, July 20th and 21st, 1910.
Under the Patronage and Support of the Mayor and Corporation of the City of Coventry.

Special Engagement of the World-Famed
"BLACK DIKE MILLS QUEENSBURY BAND,"
MAGNIFICENT FIREWORK DISPLAYS,
and numerous other attractions.

Particulars in future Advertisements.
SCHEDULE OF PRIZES may be obtained from the Secretary, Mr. ELLIS E. CRISP, Ferndale, 19, Westminster Road, Coventry.

HANLEY PARK, STAFFORDSHIRE.
July 6th and 7th, 1910.

FOURTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes, Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for "TRADE EXHIBIT"
(For particulars see page 10 in Schedule).
Valuable Special Prizes offered by the principal Firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.

Schedules, post free, on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

LEICESTER.—ABBEY PARK FLOWER SHOW on 2nd and 3rd August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses, etc. Silver Cup and Gold Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Superintendent.

RICHMOND HORTICULTURAL SOCIETY

The 36th ANNUAL SHOW
On WEDNESDAY, June 29th.
Silver Challenge Cups. Gold and Silver Medals.
Valuable Money Prizes.
Entries close June 22nd.
W. J. COOK, Hon. Sec., Holmsley House, Richmond, Surrey.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

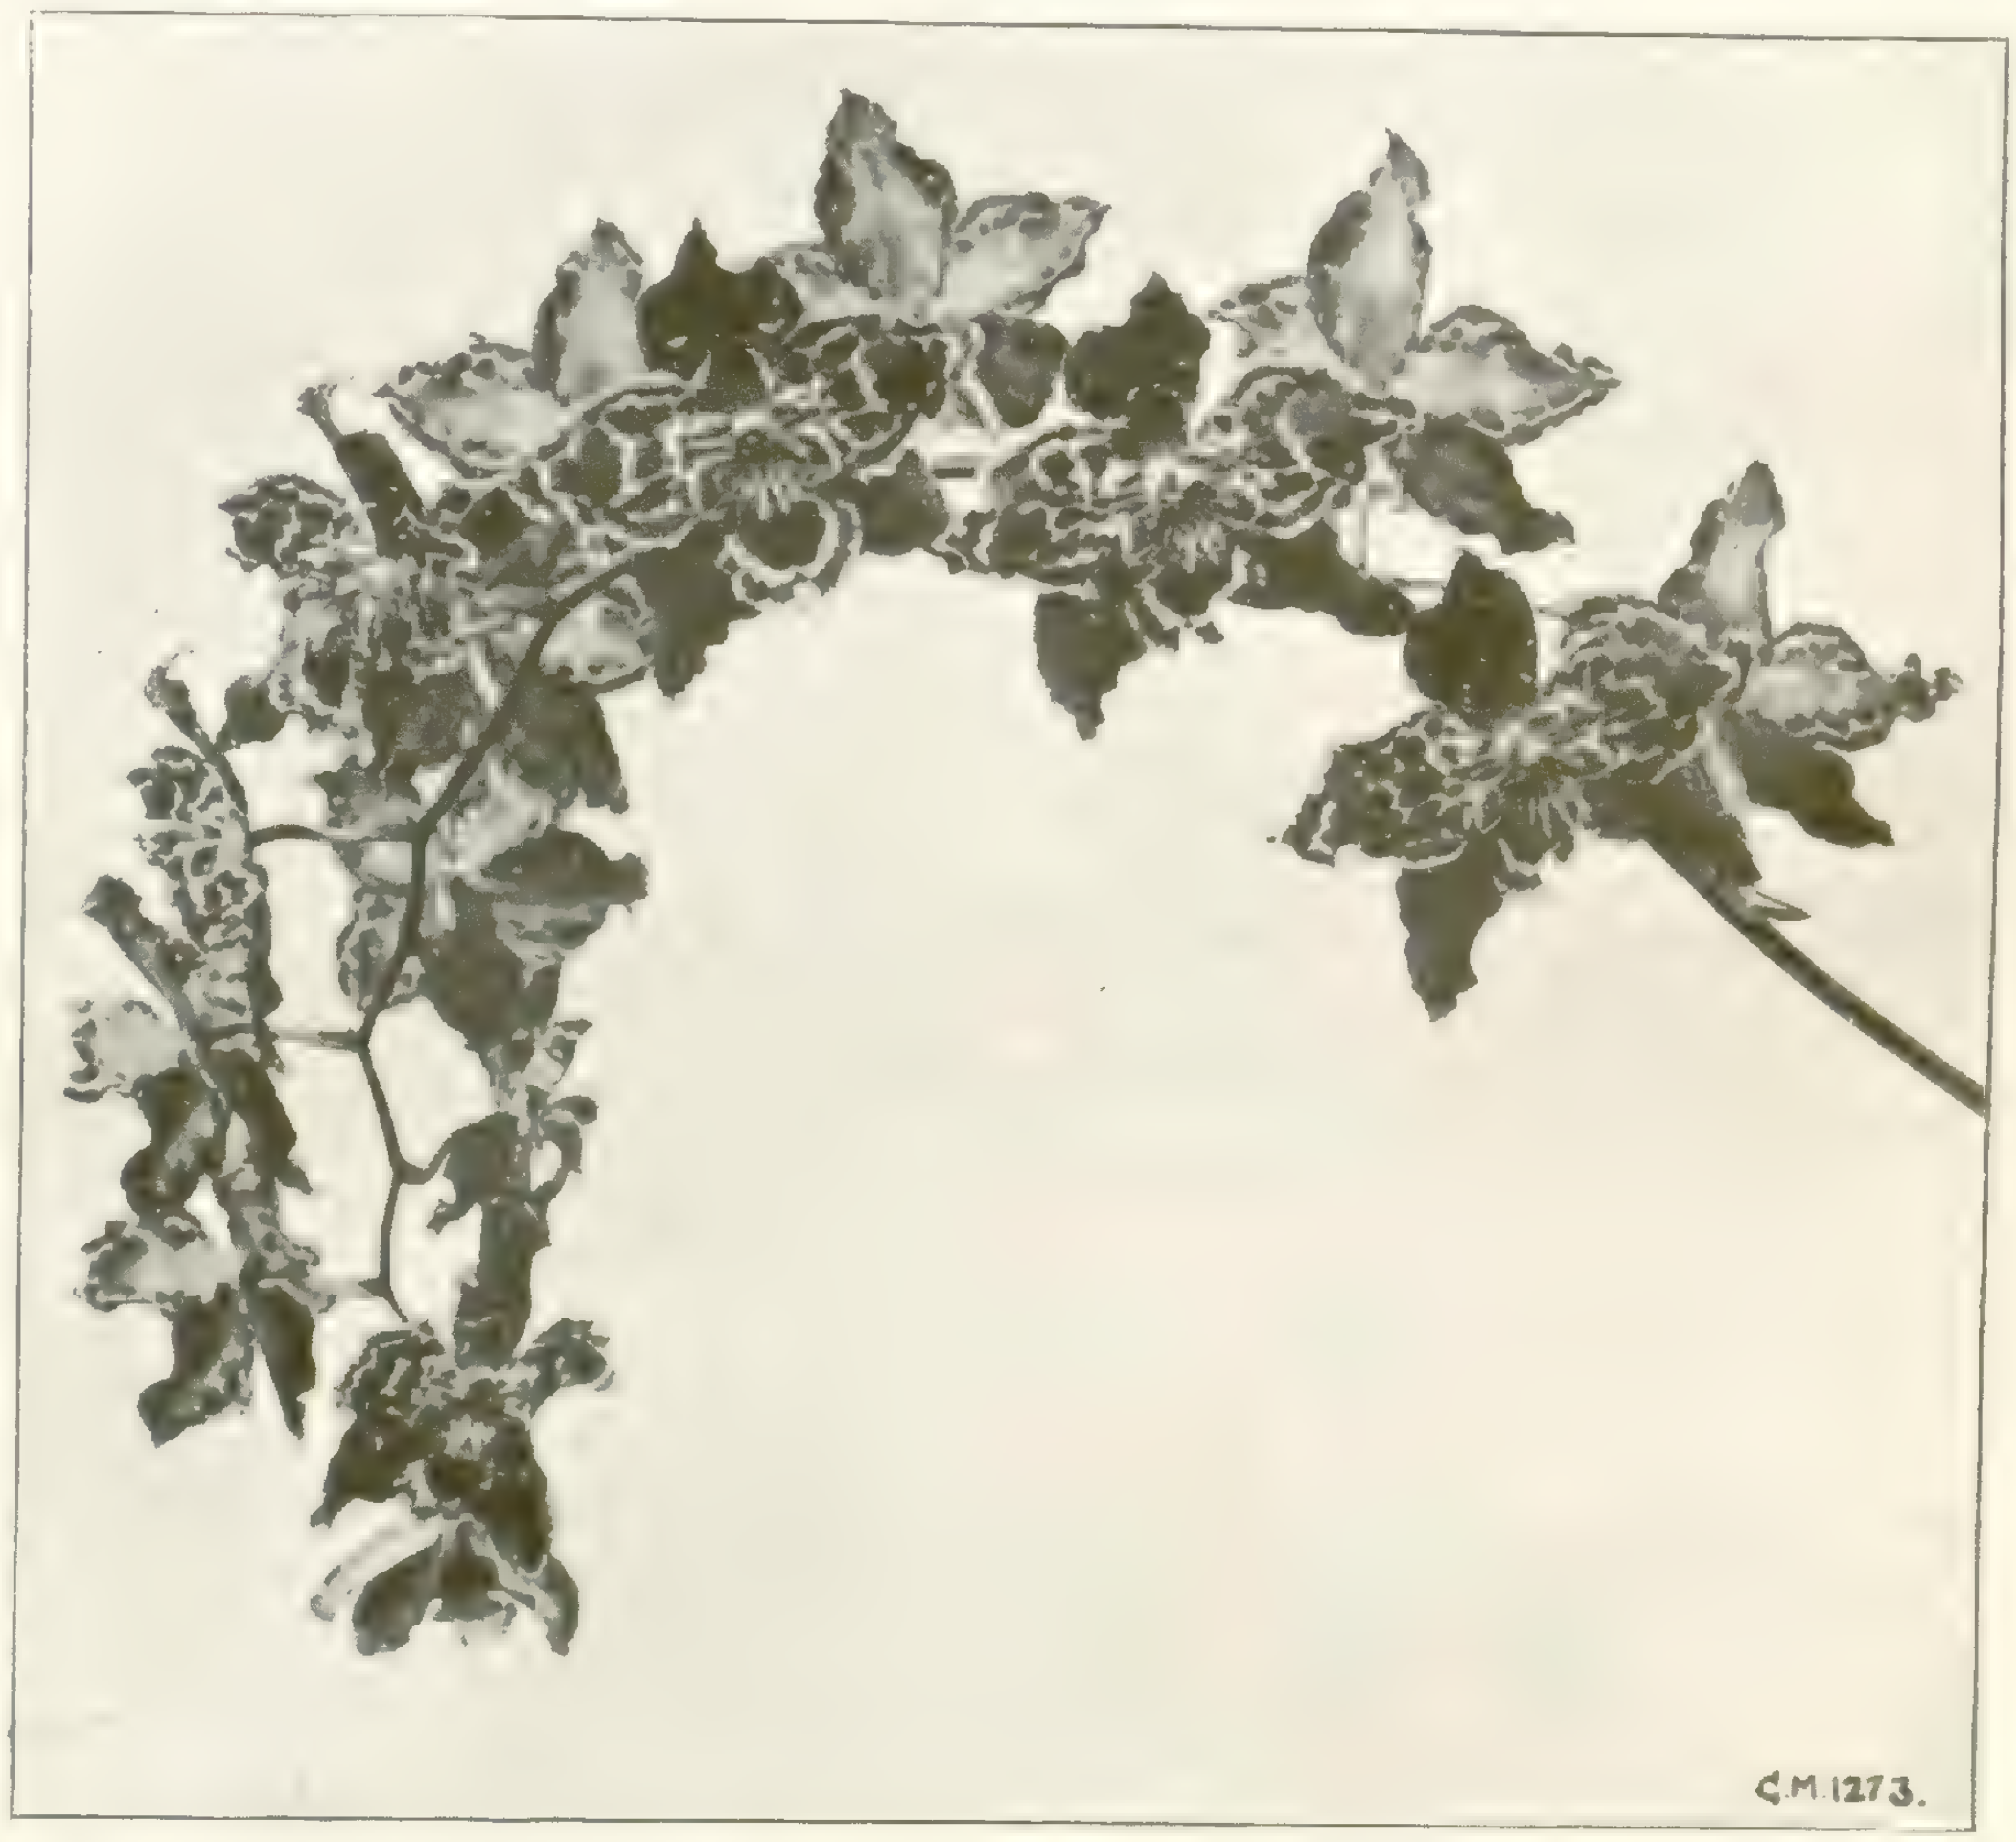
JUNE 7.

Every bit of space was again occupied in the Royal Horticultural Hall, and there was a great crowd of Fellows and visitors to see the packed display. The thundery weather and the dense crowd of people combined to make the hall unpleasantly warm during the earlier part of the afternoon, and all the doors had to be opened to cool the place. Hardy flowers, roses, orchids, and vegetables were the leading features, apart from the large set of exceptionally fine and accurate paintings of orchids staged along the end of the hall by the artist, Miss M. Walters Anson, of The Broadway, Streatham. We do not remember to have previously seen such beautiful, minutely accurate, and altogether life-like representations of orchids before. The finest of the new orchids displayed within the last year or so were depicted, and from cattleyas to vandas all were alike good. On the recommendation of the Orchid Committee the Council awarded Miss Anson a gold medal.

FLORAL COMMITTEE.

This body had a busy time. The majority of the members sat for an hour and a half, under the presidency of Mr. H. B. May, judging new plants; while another and smaller body, with Mr. William Marshall as chairman, judged the fifty groups entered on the Floral Committee books. Fifteen Awards of Merit and thirty-two medals were granted.

A rare display of irises was made by Messrs. Barr and Sons, Covent Garden, who also showed the charming Lupinus polyphyllus Moerheimi and L. p. roseus. In the large display made by Messrs. W. Cutbush and Son, Highgate, the eremurus spikes over a groundwork of Campanula glomerata dahurica was the central feature; Anemone sulphurea, Geum Apricot, and the white wistaria were other notable plants. Carnation Queen Mary (A.M.) also came from the Highgate firm. Miss Hemus, Holdfast Hall, Upton-on-Severn, had a glorious display of fragrant sweet peas set up in large bunches; Helen Lewis, Elizabeth Hemus, Paradise Apple Blossom, Bronze Paradise, Evelyn Hemus, Guy Hemus, lavender; Marjory Hemus (A.M.), lavender and white; and Cerise Paradise (A.M.), lovely soft pink, were the pick of the collection. Mr. T. Stevenson, Woburn Place Gardens, Addlestone, gained an A.M. for Sweet Pea Prince of Orange, a very bright large-flowered variety.



ODONTIODA ST. FUSCIEN VAR. IMPERATOR.
F.C.C., R.H.S., June 7, Mons. Graire, Amiens, France. Flowers brilliantly coloured with rich crimson red on a creamy-yellow ground.

Mr. A. T. Paskett, gardener to E. J. Johnstone, Esq., Burrs Wood, Groombridge, put up a glorious group of Malmaison carnations, showing cut blooms and flowering plants, and making a grand exhibit. Lupins in a great variety of colours were shown by Messrs. Bakers, Wolverhampton, the rosy and blue forms being the chief attraction; Mertensia elongata (A.M.) and Oriental poppies were also well represented, the rich orange-salmon Queen Alexandra being very brilliant. Messrs. Jas. Veitch and Sons, Chelsea, brought forward their new hybrid Calceolaria Buttercup, Rehmannia angulata, Pelargonium White Queen (A.M.), Kalanchoe flammea, and a splendid selection of streptocarpuses—the pink and rose and blue shades all commanding a great deal of attention. The same firm had cannas, gloxinias, Exacum macranthum, and other good things. Columbines were splendidly shown by Messrs. Dobbie and Co., Edinburgh and Marks Tey; the golden-cupped forms and the lovely lavender shades were charming, and the size and elegance of the flowers were grand.

Among the carnations shown by Messrs. Stuart Low and Co., Enfield, the new perpetual-flowering Malmaison variety named Princess Juliana, salmon buff, was conspicuously good; the new frilled, double pink, named Gloriosa, was another good thing, and the Lyon rose proved a great source of interest. The Lowberry figured among the flowers in this group. Mr. W. H. Page, Tangley Nurseries, Hampton, put up a delightful exhibit of weeping standards of Dorothy Perkins and Hiawatha roses, associated with magnificently-grown plants of Lilium longiflorum and Spiræa Peach Blossom, equally well managed.

A grand group of rambling roses, in pots, was made by Messrs. Thos. Rochford and Sons, Broxbourne, and it provided the great feature of the exhibition. The plants were in all cases magnificently grown and flowered, and were trained as pillars, arches, weeping standards, and bushes. The leading varieties were Hiawatha, Dorothy Perkins, White Dorothy, Mrs. W. Flight, American Pillar, and Crimson Rambler. The two large end arches of Dorothy Perkins were remarkably fine. A bank of rhododendrons from Messrs. John Waterer and Sons, Lim., Bagshot, provided a splendid blaze of colour; the varieties that appeared to attract most attention were Pink Pearl, Gomer Waterer, Kate Waterer, Michael Waterer, and Doncaster.

The varieties of Lupinus polyphyllus shown by Mr. Amos Perry, Enfield, were charming, especially the rose and the yellow shades. Pyrethrum Auricule, single, rose; Papaver Queen Alexandra, hybrid hardy mimuluses, Hemerocallis aurantiaca, and the grand Iris Sir Michael were among the choicest things in the group. Mr. W. J. Godfrey, Exmouth, brought up cut flowers of a great number of handsome show pelargoniums; Ruby, H. S. Davy, Attraction, Market Favourite, Bridesmaid, Glenholme, Gretchen, and Godfrey's Success were a few of the finest in colour and form. Mr. Godfrey's Oriental poppies in art shades of red and pink found favour with the ladies.

Mr. C. Blick, Hayes, showed carnations delightfully, and he had exceptionally beautiful blooms of Mrs. Everard (Martin Smith), white; Miss Willmott, red; Lady Hermione, pink; and Outlaw, a yellow fancy. Messrs. Robert Veitch and Sons, Exeter, brought up Robinia Kelseyi (A.M.), Edwardsia grandiflora, with its orange-coloured flowers; Ozothamnus rosmarinifolius, Calceolaria Golden Glory, Rehmannia angulata Perfection, and Fabiana imbricata. Messrs. Kelway and Son's pyrethrums were good, and the rich single crimson-scarlet varieties, James Kelway and Langport Scarlet, outshone all the rest; Snow White (A.M.) is a lovely thing of purest white. The delphiniums were not yet at their best, but the lupins were good. Some lovely roses were once more set up by Messrs. G. Mount and Sons, Canterbury, and the varieties Lady Hillingdon and Mdme. Abel Chatenay were much to the front. In Mr. M. Pritchard's collection of hardy flowers, paeonies were present in great quantity; Primula Bulleyana, P. Littoniana, and P. sikkimensis, and a number of interesting hardy orchids, and Ornithogalum arabicum were also present. Messrs. G. Bunyard and Co., Maidstone, submitted a number of fine lupins and poppies and German irises; they also showed Dianthus Napoleon III., D. Atkinsoni, D. Marie Parc, and other interesting dianthus hybrids.

The sweet peas from Messrs. S. Bide and Sons, Farnham, included Mrs. A. Ireland, Frank Dolby, an improved Helen Lewis, Mrs. Routzahn, Mrs. Henry Bell, and several seedlings. Bougainvillea Sanderiana, crowded with brilliant bracts, and surrounded by Blush Rambler, Kathleen, and Tausendschon roses, smothered with flowers, were used by Messrs. W. Paul and Son, Waltham Cross, to fill one corner of the hall. Messrs. B. R. Cant and Sons, Colchester, had a grand box of blooms of their new rose Claudius, with a few clusters of rambling varieties. Standards of fuchsias, Salvia splendens, Abutilon Thompsoni, and Pelargonium Clorinda, from Messrs. H. B. May and Sons, Edmonton, were displayed over verbenas, heliotropes, abutilons, and marguerites.

Messrs. Paul and Sons, Cheshunt, put up a bank of roses in pots, and their collection included such varieties as Buttercup, American Pillar, Veilchenblau, Excelsa, Snowstorm, White Dorothy, and Jessica. Catalpa speciosa pulverulenta, having light green leaves freely speckled with creamy white, also shown by the Cheshunt firm, is a very attractive hardy tree. Big sheaves of noble eremurus spikes marked the display of hardy flowers from Messrs. W. Artindale and Son, Sheffield, but the violas set up by this firm were an even greater attraction. Mr. F. Lilley, Guernsey, brought over Spanish and German irises and an interesting set of ixias and brilliant sparaxis.

Messrs. R. Wallace and Co., Colchester, were large exhibitors of hardy flowers, and in addition to pyrethrums, poppies, eremuri, and pæonies, they had a fine selection of irises that included two new varieties, Isoline (A.M.), and Italia (A.M.), the latter rich purple-blue, and the former soft bronzy-yellow and purple. Among others who contributed hardy flowers we may mention Messrs. G. Jackman and Son, Woking; Messrs. J. Cheal and Sons, Crawley, who showed Cytisus scoparius Lemon Queen in good style; Mr. G. W. Miller, Wisbech, who displayed a lovely pink double pyrethrum named Queen Mary; Mr. C. Turner, Slough; Mr. G. Reuthe, Keston, whose hardy cypripediums and rhododendrons were good; Messrs. H. Cannell and Sons, Swanley, who contributed aquilegias, thalictrums, etc.; Messrs. T. S. Ware, Lim., Feltham, who had a pretty group of the double Welsh poppy and a sheaf of spikes of the lovely Rose Doré antirrhinum in their exhibit; Mr. Elliott, Stevenage; Messrs. G. and A. Clark, Dover; Mr. A. T. Harwood, Colchester; and Messrs. J. Peed and Son, Norwood, who also displayed their fine strain of gloxinias.

The new Rose Queen ivy-leaved pelargonium was brought up by Mr. W. R. Newport, Hillingdon; while heliotropes, delightfully fragrant and well-grown, from the King's Acre Nursery Company, Hereford, made a pleasing group, which contained a variety named Favourite (A.M.), with big, spreading heads of large pale flowers. The bertolonias, anoectochilus, cyrtodeiras, and other low-growing stove plants, with very elegant and brightly-marked leaves, formed an interesting group, staged by Mr. L. R. Russell, Richmond.

ORCHID COMMITTEE.

The Orchid Committee had eleven groups to consider, and a goodly number of plants were submitted for awards. One F.C.C. and two Awards of Merit were granted.

Messrs. Sander and Son's group of orchids, from St. Albans, contained a number of good things, notably Phalænopsis Rimestadiana, Brasso-cattleya Veitchi, Lælio-cattleya Fascinator, Oncidium crispum, Phaius Oakwoodiensis, Ærides Houlletti, L.-c. Canhamiana Rex, and Cattleya Dusseldorfei Undine. A little batch of finely-grown plants of Cypripedium Lawrenceanum Hyeanum, C. callosum Sanderæ, and the hybrid between these two, C. Maudiæ, came from Mr. F. Menteith Ogilvie, The Shrubbery, Oxford. From Sir Jeremiah Colman's collection at Gatton Park, Reigate, Mr. Collier brought up the bright Odontoglossum triumphans aureum. Messrs. J. and A. McBean, Cooksbridge, contributed some good miltonias, beautiful odontoglossums, and a splendid example of Lælio-cattleya Canhamiana. Mr. Edward V. Low, Haywards Heath, showed Cypripedium Maudiæ in fine style, and Odontioda Goodsonæ. Some very pretty and distinct forms of Cattleya Mossiæ were staged by Messrs. Stanley and Co., Southgate. Mr. Alexander, orchid grower to Lieut.-Col. G. L. Holford, Westonbirt, Gloucester, had grand specimens of Miltonia vexillaria virginale covered with blooms, and the lovely M. v. Snowflake (A.M.), with five spikes; Cattleya Queen of Sheba, a hybrid something like C. Whitei, and L.-c. Lustre superba; a Cultural Commendation was awarded for the miltonias.

Messrs. Charlesworth and Co., Haywards Heath, had a lovely display of Lælio-cattleya Fascinator, grandly flowered; Oncidium crispum, Odontoglossum luteo-purpureum Vuylstekeanum, Lælia purpurata alba, Odontioda Charlesworthi, O. Bradshawiæ, and the graceful Oncidium pulchellum. Handsome and well-grown plants of Cattleya gigas, about a score of them, were shown by Mr. Jensen, Lindfield, Haywards Heath, and their big purple and mauve flowers attracted a great deal of attention. M. Mertens brought over some finely-coloured odontoglossums from Ghent; and De Barri Crawshay, Esq., Sevenoaks (gardener Mr. Stables), showed Odontioda Gattonensis (A.M.), a bright and effective hybrid between O. polyxanthum and Cochlioda Noetzliana. Mons. Graire, of Amiens, had a grand plant of Odontioda St. Fuscien Imperator (F.C.C.), a splendid form of the hybrid between O. Adrianæ and Cochlioda Noetzliana; this had a long arching spike of flowers like red odontoglossums. Boxes of finely-grown and remarkably well-flowered plants of Vanda teres were brought up by Mr. W. H. Smith, gardener to W. D. James, Esq., Chichester; the flowers were large and of unusually fine colour. Cattleya Mossiæ and C. Mendeli in variety were charmingly shown by Messrs. Stuart Low and Co., Enfield, with numerous odontoglossums and oncidiums. Mr. H. Little, Baronshalt, Twickenham, contributed a group of varieties of Lælia purpurata, an orchid that has been a great favourite of his for a long number of years; L. p. grandis, and L. p. Russelliana were notably fine forms.

FRUIT AND VEGETABLE COMMITTEE.

A collection of superbly-grown vegetables, staged by Messrs. James Veitch and Sons, Chelsea, afforded a pleasant relief from the bright hues of the flowers. The display attracted a great deal of attention, and deservedly so. A few of the leading dishes included Early Favourite, Stanstead Park, All-the-Year-Round, and Marvel lettuces; Ellam's Dwarf Early, Veitch's Incomparable and Earliest of All cabbages; Sunnybank and Perfection tomatoes; Snowball and Early Dwarf Forcing cauliflowers; Selected Gradus peas; Duke of York, Midlothian Early, May Queen, and Express potatoes; and Market Gem and Perfection cucumbers. Radishes, carrots, turnips, spinach, and a whole host of other vegetables and salading were included in this fine exhibit.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Odontioda St. Fuscien var. Imperator, from Mons. Graire, Amiens.

Award of Merit. — To Sweet Peas Cerise, Paradise, and Marjory Hemus, from Miss Hemus, Upton-on-Severn; to Sweet Pea Prince of Orange, from Mr. T. Stevenson, Woburn Place Gardens, Addlestone; to Pyrethrum Snow White, from Messrs. Kelway and Son, Langport; to Robinia Kelseyi, from Messrs. Robert Veitch and Son, Exeter; to Heliotrope Favourite, from the King's Acre Nursery Company, Hereford; to Clivia King George V., from Mr. G. W. Miller, Wisbech, to Ranunculus Evening Star, from Messrs. G. and A. Clark, Dover; to Mertensia elongata, from Messrs. Bakers, Wolverhampton; to Zonal Pelargonium White Queen, from Messrs. James Veitch and Sons, Chelsea; to Irises Isoline and Italia, from Messrs. R. Wallace and Co., Colchester; Miltonia vexillaria Snowflake, from Lt.-Col. G. Holford (grower, Mr. Alexander), Westonbirt, Gloucester; and to Odontioda Gattonensis, from De Barri Crawshay, Esq., Rosefield, Sevenoaks.

MEDALS.

Gold.—To Miss Walters Anson, Streatham, for paintings of orchids; to Messrs. Thos. Rochford and Sons, Broxbourne, for roses in pots.

Silver-gilt Knightian.—To Messrs. James Veitch and Sons, Chelsea, for vegetables.

Silver-gilt Flora.—To E. J. Johnstone, Esq. (gardener, Mr. Paskett), Groombridge, for Malmaison carnations and sweet peas; to Messrs. J. Veitch and Sons, for greenhouse plants; and to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver-gilt Banksian.—To Miss Hemus, Upton-on-Severn, for sweet peas; Mr. Amos Perry, Enfield, for hardy flowers; Mr. L. R. Russell, Richmond, for stove foliage plants.

Silver Flora.—To Messrs. W. Cutbush and Son, Highgate, for hardy flowers; Mr. W. H. Page, Hampton, for liliums and roses; Mr. M. Prichard, Christchurch, for hardy flowers; Messrs. J. Waterer and Sons, Lim., Bagshot, for rhododendrons; Messrs. Stuart Low and Co., Enfield, for orchids; Messrs. Sander and Sons, St. Albans, for orchids; Mr. H. Little, Twickenham, for orchids; W. D. James, Esq., Chichester, for Vanda teres.

Silver Banksian.—To Messrs. J. and A. McBean, Cooksbridge, for orchids; to Mr. Jensen, Lindfield, for orchids; Mr. C. Blick, Hayes, for carnations; Messrs. Dobbie and Co., Edinburgh, for aquilegias; King's Acre Nursery Company, Hereford, for heliotropes; Mr. F. Lilley, Guernsey, for irises and ixias; Messrs. S. Low and Co., Enfield, for carnations, etc.; Messrs. H. B. May and Sons, Edmonton, for flowering plants; Messrs. G. Mount and Sons, Canterbury, for roses; Mr. G. Reuthe, Keston, for hardy flowers; Messrs. Robert Veitch and Son, Exeter, for choice shrubs, etc.; Messrs. R. Wallace and Co., Colchester, for irises, etc.; and Messrs. Thomas S. Ware, Lim., Feltham, for hardy flowers.

Bronze Flora.—To Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; Messrs. Paul and Son, Cheshunt, for roses; Messrs. W. Paul and Son, Waltham Cross, for roses; Messrs. J. Peed and Son, West Norwood, for gloxinias, etc.; and Mr. C. Turner, Slough, for poppies, etc.

Bronze Banksian.—To Messrs. H. Cannell and Sons, Swanley, for hardy flowers; Messrs.

B. R. Cant and Sons, Colchester, for roses; Messrs. G. and A. Clark, Dover, for hardy flowers; the Misses Hopkins, Shepperton, for hardy flowers; Messrs. G. Jackman and Son, Woking, for hardy flowers; and to Messrs. Kelway and Son, Langport, for pyrethrums, etc.

Royal Counties.

The jubilee show of the Royal Counties Agricultural Society, held in Winchester, and opened on June 7, contained features of interest to horticulturists. A new section was that of forestry, which was of an interesting nature.

Messrs. Toogood and Sons, Southampton, had an effective exhibit of flowers and vegetables. Among the former were huge masses of Salpiglossis sinuata, gladiolus, sparaxis, ixias, climbing roses, marguerites, and a very fine display of their Princess Ena Stock, which they showed so well at the recent Temple Show. Amongst vegetables, tomatoes, cucumbers, and French beans were conspicuous. The Messrs. Toogood were entrusted with the decoration of the outside of the council tent, which they effectually beautified with well-grown pillar roses, stocks, salpiglossis, etc.

Messrs. Sutton and Sons, Reading, had their usual handsome structure, inside of which were displays of vegetables and flowers. Chief among these were handsome tomatoes, potatoes, cucumbers, broad beans. Globe artichokes, cabbages, and lettuce, masses of double tuberous begonias, gloxinias, calceolarias, schizanthus, etc. In effective mounds outside were masses of Cineraria stellata, nemesias, single petunias, rhodanthes, etc., edged with an effective dark blue lobelia.

Messrs. E. Webb and Sons, Stourbridge, had a display of calceolarias, clarkias, gloxinias, and Cineraria stellata; while cauliflowers, tomatoes, cucumbers, kidney beans, etc., completed an interesting exhibit.

Mr. C. W. Breadmore, Winchester, had a superb array of sweet peas, all of out-door growth; very noticeable were such varieties as Mrs. C. W. Breadmore, Etta Dyke, Freda (an improved white), Elsie Herbert, Constance Oliver, Princess Juliana, Dusky Monarch, Mrs. Townsend, and A. N. Dickson. Messrs. E. Hillier and Sons, Winchester, were responsible for the embellishment of the president's (Earl of Northbrook) private tent, in front of which they arranged an old English garden. The paths were composed of old London flagstones, from between which were growing dwarf hardy plants. Rambling roses draped the front of the tent, trained over a rustic fence, while specimen and standard box trees added to an effect completed by a dwarf English yew hedge. Adjoining this, under huge chestnut trees, this firm arranged shrubberies, ponds, etc., all planted with choice shrubs and flowers.

Messrs. B. Ladhams and Son, Shirley, Southampton, had an artistically arranged rockery planted with choice hardy plants, consisting of masses of irises, heucheras, Aster alpinus, Aquilegia Stuarti, trollius, hemerocallis, aubrietias, etc.; they also had a mass of cut blooms of pyrethrums and poppies of well-known desirable varieties.

Newbury Gardeners' Association.

Newbury Gardeners' Association were exceptionally favoured on Wednesday in their first excursion. Thanks to the kind permission of the Earl and Countess of Carnarvon they enjoyed the privilege of visiting the beautiful gardens at Highclere Castle, and the famous shrubberies at Milford. The weather, which had appeared none too promising in the morning, proved pleasantly fine, and with genial sunshine lightening up the landscape, the gardens and grounds were seen in their early summer beauty. It was, of course, too soon for the roses to be in bloom, but there was, nevertheless, no lack of colour, and great delight was found in the full, fresh foliage of the splendid trees for which Highclere is famous, while the Milford shrubberies were almost at their best.

It was not surprising that the party should be a large one, numbering about eighty, and comprised almost exclusively of members of the Association. They journeyed by road and rail, some cycled, others walked long distances in order to participate in this pleasurable programme.

Entering the park by way of Chericot Lodge, the party was first taken around the pleasure grounds surrounding the stately Castle, situated amid woodland scenery not to be excelled in the Kingdom. The broad expanse of undulating turf serves as an effective setting to Barry's graceful architecture, while stretching to the south the wooded slopes of Siddown Hill, crowned by "Heaven's Gate," provide as fair a scene of rural beauty as any would wish to see. Here and there about the lawns are those magnificent cedars of Lebanon, for which Highclere is famous, their branches stretching out and providing, on a hot day, grateful shade and a delightfully cool resort. On every side the eye was charmed with the delicate tints in which Nature clothes herself in the first days of June. Here a hawthorn, a mass of snow-white bloom, and rising behind in effective relief a copper beech with the sunshine gilding its leaves of bronze. Sometimes a glimpse of golden laburnam, with a background of oak and beech in the freshest verdure. Groups of azaleas afforded gorgeous colour, which stood out prominently against the green turf. The visitors were particularly drawn to a bed of the new rhododendron Pink Pearl, in splendid bloom, massive bunches, yet beautifully delicate in tint and graceful in formation. There was unstinted admiration for this example of skilful cultivation.

In the houses and kitchen garden great improvements are being made, and high culture is the order of the day. The party presently returned to the Carnarvon Arms, where, in the Magistrates' Room, through the hospitality of the Earl and Countess of Carnarvon, tea was provided. Mr. Blake, on behalf of Lord and Lady Carnarvon, offered a hearty welcome to Highclere, and then the Chairman expressed the general feeling of gratitude to the Earl and Countess of Carnarvon for their great kindness in allowing the Association to visit their magnificent park and beautiful gardens. Such a privilege was of great assistance to a young society such as this, and ought to be the means of securing many new members. They had seen much of the newest and best in horticulture, and the visit must prove of great benefit to all of them as individuals. They asked Mr. Blake to convey to the Earl and Countess their grateful thanks for allowing them to spend so pleasant a day.

The place for the next excursion was discussed. After detailed consideration, a large majority favoured a joint excursion to Chilton and Littlecote in about five weeks' time.

Elstree and Boreham Wood Horticultural Society.

Mr. W. J. Pritchard, the hon. secretary of this society, delivered a most interesting lecture to the members on Tuesday, the 31st ult., on "Floral Decorations for the Home." The lecture was given in the Dining Hall, Elstree Schools, by kind permission of the head master. The lecturer had arranged to illustrate his remarks by a varied display of flowers, the most conspicuous design being a dinner table of Enchantress carnations and Asparagus Sprengeri; one of yellow Azalea mollis, and others of tulips, roses, carnations, etc., were all excellent. The lecture was full of interesting and instructive remarks, and the lecturer appeared to be thoroughly conversant with the subject he had chosen, and at the close was warmly applauded. Votes of thanks to the lecturer and the chairman, and the enrolling of several new members, brought an enjoyable evening to a close.

There is no better guide to the kitchen garden than Vegetables and their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

STRAWBERRY CULTIVATION FOR MARKET.

(Concluded from page 426.)

◆

Gathering and Marketing.

Gathering the Crop.—An average yield of strawberries taken over a series of years may be estimated at 1,000 baskets per acre, each basket containing from 4 to 5 lb. of fruit. Excluding the special prices obtained for the few very early consignments, the price per basket in a good season may be put at 1s. 3d., while in a bad season it falls as low as 10d.; a fair average under all conditions is probably 1s.

The cost of gathering the fruit is an item of considerable expense, and will vary from ¼d. to ½d. per lb., or, on an average, 1½d. per gallon, in addition to which is the expense of carting the produce to rail, freight to market, and salesman's commission.

Marketing.—Where the industry has become extensive, the railway companies usually provide fruit vans for the carriage of the fruit to the large markets, and much may be done in the direction of reducing the cost of transit by small holders combining to send their consignments in large lots.

The varying capacity of baskets and their disposal when empty are matters of some difficulty. In the South of England the slender wicker basket is in common use, but its varying capacity and the difficulty of estimating the exact weight of contents detracts from its usefulness. The buyer also has objected to the trouble of returning the wicker baskets or paying a charge of 2d. in lieu thereof, and a new form of chip basket has been introduced which promises to meet this difficulty. These baskets contain a definite and uniform weight (5lb.), and it is proposed that they should be sold with the fruit at an inclusive price, a practice largely adopted by the majority of continental growers. The cost of the baskets, which amounts to 1d. each when purchased in 50-gross lots, will, it is claimed, be amply covered by the extra price realised owing to the buyers knowing exactly what weight of fruit they are purchasing. Further, many growers maintain that the fruit is damaged during transit when packed in the wicker baskets, their rough and irregular interiors bruising the fruit inside; the chip basket, made of smooth light veneer, obviates this difficulty and presents a much safer and more compact form of package.

Insect and other Pests.

Like all other plants which are raised to a high standard of cultivation, strawberries are assailed by a variety of insect pests, among the most prevalent and destructive of which is the wireworm. Where new ground is broken up and not over-deeply trenched, the grubs commence their ravages on newly-formed plantations, and continue to work havoc among the roots so long as the plantations exist. When new plantations immediately succeed old ones, the young plants are often completely destroyed.

The Green Rose-Chafer (Cetonia aurata) is also very injurious. As a grub it feeds on the roots, while in the perfect state as a beetle it causes considerable injury to the blossoms by piercing a hole just below the flower buds, causing them to become detached from the parent plant; the stamens of the flower are destroyed by the biting off of the anthers.

The Otiorhynchus Weevils (O. sulcatus, O. picipes, and O. tenebricosus) do considerable damage, the grubs feeding on the roots and the weevils on the shoots and runners.

The ground Beetles Pterostichus vulgaris, Steropus madidus, Harpalus ruficornis, and Calathus cisteloides, feed at night on the fruits. Occasional damage is done by other beetles and by the caterpillars of some moths.

Slugs and snails are also enemies of the strawberry, both fruit and leaves being attacked.

Eelworms (Tylenchus devastatrix Kuhn., and Aphelenchus fragariae Ritz. Bos.) also cause much loss among strawberries, the former damaging the roots and crown of the plant, while the latter species causes a somewhat cauliflower-like growth and prohibits the proper development of the buds.

Strawberry Leaf Spot (Sphaerella fragariae Tul.) causes dark brown spots to appear on the leaves. These spots gradually increase in size, becoming whitish at the centre and surrounded by a red margin. The leaf then turns yellow and soon dies, and as the disease spreads quickly, much injury follows. As soon as the disease is observed, the plants should be sprayed with Bordeaux mixture—10lb. sulphate of copper and 8 to 10 lb. of lime in 100 gallons of water. Later in the season, after the fruit has been removed, the foliage should be mown, and allowed to dry; the beds should then be covered thinly with straw and burnt over. This may appear a drastic method, but experience has shown it to be highly successful, and followed by a luxuriant growth of healthy and vigorous foliage.

Strawberry Mildew (Sphaerotheca Castagnei Lév.) has caused serious loss to strawberry growers during recent years. The fungus completely covers the fruit with a dense white mildew, resembling and closely allied to the summer stage of the American Gooseberry Mildew (Sphaerotheca mors-uvae). It is usually only observed by the grower on the fruit, but generally occurs first on the under surface of the leaves, where it is not so conspicuous. Growers should be careful not to overlook this point, but to examine the leaves regularly, as it is only at this early stage that remedial measures can be satisfactorily adopted. Where the disease appears, the plants should be sprayed with Bordeaux mixture, and a sprayer which will reach the under surface of the leaves should be employed, while the soil should also be wetted. When hops are grown, great care should be taken to prevent this fungus spreading to the hops, as it causes hop mildew.

TRADE NOTE.

In the old days bast was commonly used as a tying material in gardens, and old Russian mats were unravelled so that none of it should be wasted. Then raffia became popular, and still is very widely used both in its natural and green-dyed state. But latterly several other materials have been placed before the public for tying purposes, and they have met with great favour, chiefly because of the handy form in which they are supplied, their durability, and the fact that as they are in very long lengths there is not so much wastage of "ends" as in raffia. One of these new materials is Greentwist, manufactured by Messrs. Robertson, Ireland, and Co., of Dundee. This is a green string-like substance, soft, durable, and easily manipulated, and put up in handy balls, each ball containing about two hundred yards. Either for chrysanthemums or tomatoes, or for the finer purposes of conservatory and exhibition plants, Greentwist is equally valuable, and commends itself alike to professional and amateur gardeners.

FORTHCOMING ENGAGEMENTS.

SATURDAY, June 11.—R.H.S. Gardens Club; Annual meeting at Wisley Gardens.

MONDAY, June 13.—United Horticultural Benefit and Provident Society.

WEDNESDAY, June 15.—York Floral Fete and Gala, three days.

THURSDAY, June 16.—Linnean Society.
Dundrum Horticultural Society.

TUESDAY, June 21.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m on "Fifty Years among Pansies and Violas," by Mr. W. Cuthbertson and Mr. Jas. Grieve.
Oxfordshire Horticultural Society.

WEDNESDAY, June 22.—Royal Agricultural Society's Show at Liverpool, four days.
Stillorgan and Foxrock Horticultural Society.

TUESDAY, June 28.—Isle of Wight Rose Show.

WEDNESDAY, June 29.—Richmond Flower Show.

THURSDAY, June 30.—Birmingham Rose Show.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

ROSA MOYESI.—S. J., Doncaster: This is a Chinese species introduced to cultivation by Messrs. James Veitch and Sons. It has deep red flowers about three inches across. It is of very distinct habit, and will probably be valuable to hybridists. Rosa Moyesi was described and figured in the GARDENERS' MAGAZINE of June 20, 1908.

SLUGS, ETC., IN ORCHID HOUSES.—J. T., Feltham: Persistent trapping with small heaps of brewer's grains, lettuce and cabbage leaves, and anything else that will entice slugs, must be adopted, and every night the house must be searched with the aid of a lantern. Hollowed halves of potatoes or turnips, laid hollow side down on the shingle, and also on the pots, will attract slugs and woodlice, and must be examined once or twice a day. A dirty pot partly filled with dry, dirty moss, and placed in dry corners, will entrap woodlice, and arsenical paste, to be obtained from the sundriesmen, will answer for cockroaches and beetles. The great thing, however, is persistent effort over a considerable period, and constant watchfulness and cleanliness.

VIOLAS FOR GENERAL PURPOSES.—S. M. D., Potter's Bar: Quite apart from any value they may possess for exhibition purposes, the following varieties are of great value in the garden by reason of their good habit, freedom of flowering, colour, purity, and form: Pencaitland, white and yellow; Snowflake, Alexandra, Countess of Hopetoun, Duchess of York, and Marchioness, white; Sylvia, Mrs. A. D. Parker, creamy white; Cream King, cream colour; Primrose Dame, Ardwell Gem and Sulphurea, primrose; Walter Welsh, Redbraes Yellow, Royal Sovereign, King Cup, Bullion, and Grievi, yellow; Florizel and Kitty Bell, lavender; Maggie Mott, Mauve Queen, and Blue Duchess, light blue; Councillor Waters, Ophelia, Admiral of the Blues, Royal Scot, True Blue, and Archie Grant, deep blue; Wm. Niel, Blue Cloud, Crimson Bedder, Glencoe, and Mrs. Chichester are good fancy varieties for bedding and garden decoration generally.

NATIONAL DAHLIA SOCIETY.—F. J. C., Salisbury: This society consists of three classes of members, namely, Fellows paying annual subscriptions of not less than one guinea; Associates paying annual subscriptions of not less than half a guinea; and ordinary members paying annual subscriptions of not less than 5s. The minimum subscription for an exhibiting nurseryman is 10s. 6d. for each show; for an exhibiting amateur the minimum subscription is 5s. for each show. Mr. E. F. Hawes, Royal Botanic Gardens, Regent's Park, N.W., is the hon. secretary.

MUSCAT GRAPES.—H. J. C., Gravesend: It is very rare that Muscat of Alexandria and Black Hamburgh grapes are a success when grown together in the same house over a long period. The Muscat requires a longer season and more heat than the Black Hamburgh, consequently whichever variety is favoured the other must suffer. Under the circumstances the best thing to be done is to train up young Muscat rods from the base to take the place of the old rods, as the younger canes will be more vigorous, and be better able to stand the conditions afforded the black grapes. We should be inclined to keep the house under conditions suitable for Muscats and let the Black Hamburghs take their chance, especially as they would ripen the earlier, and take kindlier to the warmer conditions than the Muscats would to the cooler treatment.

INFESTED RANUNCULUS LEAVES.—G. A. W., Chippenham: The ranunculuses have been allowed to get very dry, consequently the leaves have suffered from an attack of green-fly, an insect plentiful on the specimens sent. This attack would be bad enough alone, but the plants have another enemy, a leaf miner akin to those that attack celery, marguerites, and parsnips. The flies deposit their eggs during warm spring weather, and the grubs feed in the leaf tissues, making long irregular tunnels between the upper and lower epidermis, and so severely reduce the power of the leaf to manufacture food, and, consequently, the vitality of the plant is greatly lowered. The grubs soon pass through the various stages from egg to perfect fly, so that two or three broods may occur in a season. In the case of the latest brood, in autumn, the maggots turn to pupæ, and remain in the soil during the winter. If you have sufficient patience, and the bed is not a large one, every leaf should be examined, and every grub in each leaf be crushed between finger and thumb. Any insecticide strong enough to kill the grubs would also kill or further injure the leaf. A safe and quick method is to cut off and burn all infested leaves, but probably the cure would be worse than the disease in your case, if most of the leaves are as badly infested as those sent us. Frequent sprayings with a quassia and soft soap solution will render the leaves distasteful to the fly, but frequent light dustings of old soot over the leaves while the latter are damp with dew or rain, is an excellent method, and is found to be very successful as a preventive in the case of celery. When the ranunculuses are lifted remove and burn the top four inches of soil to kill the pupæ, and plant the tubers in new clean soil another season. Meanwhile keep a look out for infestation in other ranunculuses, remembering that buttercups are often badly infested with the leaf miner, and if allowed to develop in hedge or garden would provide a source of future attacks.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

W. G. R., Ventnor.—A flower of the salsafy, Tragopogon porriifolium.

A. B., Ashbourne.—1, Leucothoe Catesbæi; 2, Skimmia japonica; 3, Daphne cneorum; 4, Spiræa prunifolia flore pleno; 5, Prunus japonica flore albo pleno; 6, Caragana arborescens; 7, Spiræa Thunbergi; 8, Vaccinium myrtillus.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Warwickshire Horticultural Society.—Annual summer fête on July 20 and 21 in the Cricket Grounds, Butts, Coventry. Nearly £200 offered in prizes.

Kingstown Horticultural Society.—Second Summer Show on August 17, in the People's Park, Kingstown.

Chester Paxton Society.—Chrysanthemum and Fruit Show in the Town Hall, Chester, on November 16 and 17.

Purley Rose and Horticultural Society.—Summer Show on July 9, in the grounds of Upper Woodcote, Foxley Lane, Purley.

Reigate Rose and Sweet Pea Society.—The fifth annual exhibition will take place on July 6, at Brokes Lodge, Reigate.

OBITUARY.

◆

M. ERNEST CALVAT.

Just too late for insertion in our issue of June 4 we received the unwelcome intelligence of the death of Mons. Ernest Calvat, of Grenoble, a gentleman well known to a very large circle of British horticulturists, and one whose fame as a raiser of fine chrysanthemums has gone throughout the world. Born in 1852, the son of a former Mayor of Grenoble, M. E. Calvat received a liberal education at home, and completed his studies in London. Returning to France he entered and subsequently became the head of a large glove making business established by his father. Taking up horticulture as a hobby he, in 1887, turned his attention to chrysanthemums, and finding the climate of Grenoble was very favourable to seed raising he soon began to improve the flower. Already the British idea of an exhibition Japanese chrysanthemum was a long way ahead of that entertained on the Continent, but M. Calvat soon reached and surpassed the achievements of most other raisers, and for many years his new varieties were awaited each season with a good deal of interest and excitement. His novelties become very popular, and produced flowers of the finest exhibition form and size, but many of them were not easily cultivated by the majority of growers. In 1893 the beautiful variety Mdme. Carnot appeared and captivated everyone. In later years M. Calvat continued the work, gave up his glove business, and devoted his attention not only to the production of new varieties but to the provision of thousands of big blooms for the Parisian florists.

Many honours fell to M. Calvat, including medals and certificates from our own National Chrysanthemum Society. He gained the Grand Prix d'Honneur at Paris in 1908, and was made Chevalier of the Mérite Agricole. He was also an officer of the French Academy, and a Knight of the Order of the Crown of Italy. Among chrysanthemum lovers the world over M. Calvat and his work will long be kept in memory, while all who knew him personally will always remember him as a quiet, courteous, and genial gentleman, whose acquaintance it was an honour to possess.

HERTFORDSHIRE COUNTY COUNCIL.

EDUCATION AGRICULTURAL SUB-COMMITTEE.

HORTICULTURAL INSTRUCTOR.

The Agricultural Sub-Committee of the Hertfordshire County Council invite applications for the post of PERIPATETIC LECTURER and STAFF INSTRUCTOR in Horticulture and Botany.

The Instructor appointed must have a practical and theoretical knowledge of the subjects, and have been accustomed to give lectures upon them. He must also have had experience in teaching and supervising gardening at Elementary Schools. He will be required to devote his whole time to his duties. Salary, £100 per annum, in addition to which third-class travelling expenses will be allowed.

Applications on forms which can be obtained from the Assistant Education Officer, Mr. A. DEAN, Eastfield, St. Albans, accompanied by copies of not more than three recent testimonials, and endorsed "Horticultural Instructor," must be delivered to Mr. A. Dean, at the above-mentioned address. not later than SATURDAY, the 25th June, 1910.

C. E. LONGMORE.
Clerk of the Hertfordshire County Council.
Education Department,
Hertford,
6th June, 1910.

NOTE OF THE WEEK.

◆

Water.

Water, though one of the most familiar of the so-called elements, is certainly seen to be one of the most wonderful when carefully considered. In the first place, not only can it be resolved into its two constituent gases, oxygen and hydrogen, which, when commingled in gaseous form constitute a most explosive mixture, but even without this resolution into gas, it can assume an equally invisible form as aerial vapour. In the second place, we may behold it in the form of visible vapour, consisting of isolated floating minute drops of water, which may be piled up literally mountain high in the form of towering cumulus clouds, or may pervade the atmosphere as formless fog. Thirdly, we see it in what may be termed its proper water or truly liquid form, in which it covers by far the major part of the world's surface in the shape of oceans, and dots and seams the land itself with lake and river, or their minor forms of pond and brooklet. Finally, we may see it as a hard, brittle, intractable solid in its frozen form of ice, or as an accumulation of myriads of delicate crystals of infinite hexagonal design in the shape of snow. There is, however, still another aspect of water, which, though familiar enough, is more apt to be overlooked, and that is as an essential constituent of many so-called solid bodies, and it is this aspect of water with which the horticulturist, agriculturist, and the garden lover generally are brought most into contact. Nature uses water to an enormous extent as a padding for her vegetable creations; give her a few ounces of salts and a bucket of water and she will build you up gourds, melons, pumpkins, or cucumbers galore, one-twentieth part alone of whose solidity shall be really solid, and all the rest shall be pure water. All succulent vegetation is similarly a mere framework or skeleton inflated with watery bladders. Go to a museum and see the components of our very selves, and mark how big is the vessel of pure water which represents that item in our being. Water, viewed from this standpoint, is the first essential of life. The cell, the universal life basis, is but a tiny bag of water enriched by self-absorbed nourishment, and endowed with whatever potencies it has derived from the parental source as it perfects itself, divides, and multiplies to perform its varied offices, simple or complex, according to the organism of which it forms a creative part, it must have water, water, water at every stage, or its operations cease. The sap of plants, the blood of animals, up to our own vital supply, are nothing but water charged with nutrition, and carried, in the one case, by absorption and transpiration, and in the other, by the pumping action of the heart to feed and assist in building and repairing the vital machinery of the organism concerned. We drink when we feel thirsty by virtue of the fact that the sensation of thirst is given us as an indication that the internal supply of water is running short, and many an unfortunate traveller can tell us of the agony which results when it cannot be replenished. How essential a constant supply is to plant life can be easily evidenced by severing the branch of a tree, or shrub, or even a flower, and noting how rapidly on a hot day the leaves or the flower will wilt and droop, and eventually even shrivel into comparative nothingness as regards substance. How beneficial then must the scheme of Creation appear to a thinking mind, when it reflects upon the wonderful arrangements existing to secure the distribution of water far and wide to meet all these vital needs. Thanks to the diversity of the forms water is capable of assuming, we find it transformed under tropical suns from the liquid to the aerial vapour form, and carried from tropical oceans northward and southward, sometimes as invisible vapour and sometimes as dense masses of cloud, eventually, under the cooler conditions of temperate climes or arctic ones, resuming the liquid form as rain or snow, irrigating the thirsty plain or adding another layer of snow to the mountain summits, but in either case bound to return sooner or later by glacier or river to the mother ocean, to do the same work over and over again. Meanwhile there are agencies at work to keep the main reservoirs, i.e., the oceans, from becoming stagnant, as they would do if ever motionless. The winds and tides agitate the surface, and to restore the balance upset by the drain from the tropics, which we have alluded to as a typical factor in the rain supply, though by no means an exclusive one, there is, in addition to surface currents, a constant slow drifting of the great body of bottom water from both polar regions to the equator, due to the cold water of melting snow and ice being heavier than the warmer water at the surface. Verily, the ways of the Creator are wonderful.

MR. ALEXANDER MACMILLAN,
The Neill Prizeman of 1908-10.

Mr. Alexander Macmillan, of Edinburgh, has been awarded by the Council of the Royal Caledonian Horticultural Society the Neill Prize for the biennial period 1908 to 1910. This prize is one which was directed by the late Dr. Patrick Neill to be awarded to any distinguished Scottish botanist or cultivator. Mr. Macmillan was born about 75 years ago, and his first experience in gardening was gained in a market garden near Port Glasgow, where he served his apprenticeship. Thereafter he went to Edinburgh, going from there to various places in England and Scotland. During the last 16 years of his active life he was gardener at Trinity Cottage, Edinburgh, and it was here that most of his experiments in the hybridising of rhododendrons was carried on. That Mr. Macmillan well deserves the honour conferred on him by the society will be fully acknowledged by all who are acquainted with the excellent work he has accomplished. His earliest experiments in plant improvement were with pelargoniums, and later on he turned his attention to chrysanthemums. He was the first to advocate the holding of a chrysanthemum show in Scotland, and, by his writing and the chrysanthemums he exhibited, did much to stimulate an active interest in the highly successful show which is held annually in Edinburgh. When at Trinity Cottage Gardens Mr. Macmillan devoted his attention to greenhouse rhododendrons, and the results of his well-devised efforts are now distributed over the country. Among other varieties he raised are James Whitton, Nathaniel Bryson, and Mrs. Macmillan. Mr. Macmillan gained a Banksian medal at Keswick in August, 1892, and also gained medals at the International Exhibition in 1892, and Gardening and Forestry Exhibition in 1893. He was also a prize-winner for chrysanthemums at the Royal Aquarium in September, 1903. He holds silver medals from the Royal Caledonian Horticultural Society and the Scottish Horticultural Association, and five First Class Certificates from the former and an equal number of Cultural Certificates from the latter.

Sir George L. Holford, K.C.V.O.—Our readers will learn with very great pleasure and interest that Lieut.-Colonel G. L. Holford, C.I.E., of Westonbirt, Tetbury, Gloucester, has been promoted to be a Knight Commander of the Royal Victorian Order.

New Forestry Museum at Kew.—The new museum at Kew, which has been provided for the display of the products of the forest and of objects relating thereto, has been opened to the public, and should prove a valuable addition to the Royal Gardens. This museum, which is officially known as No. 4, occupies the site of Cambridge Cottage, long the Kew residence of the Duke of Cambridge, and is on the north-east boundary of the gardens, and therefore not far distant from Kew Church. On the death of the Duke of Cambridge in 1904, the late King Edward VII. commanded the cottage and grounds to be added to the Royal Gardens. Appreciating the importance of forestry as an industry in the United Kingdom, the authorities decided to devote it to the timber of trees of economic value grown in this country, with specimens of their fruits, branches, etc. In adapting the building to its present purpose, three spacious rooms and a corridor have been provided, and of these the largest is about 50 feet in width and 60 feet in length. In this there are trunks of the principal timber trees grown in this country, with planks and cross sections. The next largest room also has a length of 60 feet, but the width is 36 feet; and in this there are glass cases down the centre and on the sides in which cones of coniferous trees, seeds, bark, dried shoots, photographs illustrative of the summer and winter aspects of various deciduous trees, etc., are arranged. The old boundary wall to the grounds remains, and access is obtained to the museum by means of new gates immediately opposite the iris garden.

The Young Naturalists' League.—Will you allow me, writes Mr. W. Percival Westell, F.L.S., from Chester House, Letchworth, to make known the existence of this league through the columns of your paper? The league was founded by me twelve months ago, and on it first birthday celebrated a membership of over three thousand. In view of the interest now taken in nature study in our schools, and the recognition accorded to it by education authorities, I am desirous of making the aims and objects of the league more widely known, and its work more useful and far-reaching. The time has now arrived for the appointment of branch honorary secretaries, especially schoolmasters and mistresses and those having control of boys and girls, but membership is not restricted to school children, as we welcome anyone who is desirous of joining or supporting the society in any way. I shall be glad to hear from anyone willing to help me in the promotion of this league, and to forward full particulars concerning same on application. My name will be known to many of your readers as a naturalist, and it is because of the real interest I take in the nature study movement, the success the league has already attained, and the good its extension is capable of doing, that I am desirous of widening its sphere of influence through the agency of your valuable medium.

A Gardener's Record Service.—A large gathering, representative of the tenantry and employees on the estate of Kininvie, Dufftown, Banffshire, waited upon Mr. William Munro, Kininvie House Gardens, the other evening, and presented him on his retirement with a well-filled purse of sovereigns. The Chairman, in making the presentation, expressively voiced the sentiments of the subscribers when he said that Mr. Munro retired amid every manifestation of respect and esteem by all who knew him, and added the fervent hope that their old friend might have before him a long and pleasant eventide. Mr. Munro very feelingly replied, thanking all sincerely for their great kindness to him. For the long period of 55 years Mr. Munro has followed his profession, and the past 37 years he has spent with Colonel Leslie, of Kininvie, and the previous 18 years with Colonel Marshal, of Dandaleith, Banffshire. The gathering spent a very pleasant social hour, leavened somewhat with a touch of sadness at the thought of parting. It should also be noted that Mr. Munro has been the recipient of very handsome and costly parting gifts from Colonel Leslie and his family, gifts which have given him very great pleasure and satisfaction at the close of his long spell of duty well done.

Weather in the Spring Season.—The summary of the weather during the months of March, April, and May, which form the spring quarter of the year, that has been issued by the Meteorological Office, shows that the mean temperature at Greenwich was 0.3 dgrees above the average. In the East and North-East of England only did the temperature exceed 80 degrees in the shade, and the highest temperature was 83 degrees in the East of England, and the lowest was 20 degrees in the South-West of England and the North of Scotland. With regard to rainfall, the number of rainy days exceeded the average in all districts except in the Channel Islands and the East of Scotland; and the aggregate rainfall for the thirteen weeks showed considerable variation in different parts of the United Kingdom. The total amount of rain registered was in excess of the average in the North and the East of Scotland, and in the East, South-East, and North-West of England. In other districts there was a deficiency. The difference from the average was nowhere large. The largest amount of rain registered was 12.91 inches, in the North of Scotland, and the smallest amount was 4.87 inches, in the midland counties. The duration of bright sunshine was about equal to the average, there having been an excess of 28 hours in the South-West of England, and a deficiency of 40 hours in the South of Ireland.

An Interesting Departure in Nature Study.—A new feature of Messrs. Sutton and Sons' stand at the Royal Agricultural Society's Exhibition at Liverpool next week will be a Nature Study exhibit on somewhat different lines, and of a highly educational character. It will include cases of garden and farm pests, depicting the ravages of the asparagus beetle, mangold fly, cabbage moth, carrot fly, celery fly, stem eel worm, onion fly, pea and bean weevil, wireworm, millepede, Hessian fly, and many others. Another part of the exhibit will show about 100 farm weeds, each subject being a complete, dried and mounted, plant—i.e., root, stem, leaf, flower, and seed, all botanically arranged with brief descriptions. The useful grasses and clovers will be treated in a precisely similar manner. The weed grasses will be shown actually growing and most of them in flower, as will also be the useful agricultural grasses and forage plants. Sixty leaves will be shown, representing as many different varieties of grasses, descriptive of the remarkable differences existing in their shape and venation. The idea will be carried still further by some carefully prepared dried specimens, showing the divergent root-growth of several of the commoner sorts of grass. Broomrape, dodder, and ergot, parasitic and fungus pests, will be clearly demonstrated, while poisonous (or reputed poisonous) plants, collected, arranged, and named by the firm, will be shown.

Interesting Mesembryanthemums.—Dr. R. Marioth has recently described several new South African succulent plants, and among them are two or three mesembryanthemums of quite exceptional interest. The most noteworthy of these is Mesembryanthemum mitratum, which was discovered in the desert belt east of Port Nolloth. The plant bears at the end of the apparently dead branches a fleshy knob, consisting of two closely-joined leaves, between which the flower appears. Flower and fruit then obtain nutriment from the sap of the knob until fully developed, when nothing is left of the latter except its skin. Another species takes the same care of its flowers and fruit, nursing them within its own body; but it buries itself entirely in the ground, and shows only the apex of its few leaves. As the ends of the leaves are flat, and flush with the ground, and the colour similar to the brownish gravel, it is very difficult to detect them when they are not in flower.

Turin International Exhibition, 1911.—To celebrate the 50th anniversary of the proclamation of the Kingdom of Italy, an international exhibition will be held at Turin, in April, 1911, and remain open for a period of about seven months. The exhibition grounds embrace the whole of the Valentine Park, and have an area of 247 acres. The site secured for the British section occupies a prominent position, and has an area of about 220,000 square feet. The exhibits will be arranged in twenty-six groups, and those connected with gardening, farming, and forestry, will have a place in Groups 15 and 16; and if the numerous classes are well filled, they should be of much interest to those who are in any way concerned with these industries. Full information relating to the exhibition may be obtained from the Director of the Exhibitions Branch, Board of Trade, Westminster, S.W.

GRAND YORKSHIRE GALA AND FLORAL FÊTE.

The fifty-second grand Yorkshire Gala and Floral Fête, held in Bootham Park, just outside the old Bootham Bar, in the City of York, on June 15, 16, and 17, must be regarded as the finest of a fine series. A few years ago everyone was regretting that the floral display in connection with this annual event (and this is the great attraction) was declining, but there came the Jubilee Show in 1908, when a great effort was made to revive old glories, and with splendid success. In 1909 there was another grand exhibition, and the one held during the present week was a brighter and more beautiful one than either of the last two. The high quality was surprising, and in every department there was an excellent display. Groups, orchids, hardy flowers, greenhouse flowering plants, carnations, roses, and pelargoniums were all magnificently staged, and the great tents were crowded with plants and flowers, while some exhibits had to be accommodated out of doors.

GROUPS.

Six prizes, making a total of £70, are offered in the class for a tastefully-arranged group of miscellaneous plants occupying a space of 300 square feet. Here there were five competitors, and the premier award fell to Mr. J. Donoghue, gardener to J. Pickersgill, Esq., Bardon Hill, Weetwood, Leeds, who had a delightful design executed with fine plants. The background was of tall palms, rambling roses and white liliums, with acalyphas and crotons at the base. In the centre of the foreground there was a trophy of white odontoglossums with a few yellow oncidium spikes rising from them. Specimen crotons marked the corners, and specially fine tall examples of these showy foliage plants stood clear above the small caladiums, bertolonias, ferns, cattleyas, miltonias, and Rex begonias forming the groundwork of the display. A pair of tall Humea elegans, and a pair of elegant pillars of Hiawatha rose further enhanced the grace and beauty of the front of the group.

Mr. W. A. Holmes, West End Nurseries, Chesterfield, was placed second with a bold effort, in which crotons were rather too freely used, and flowering plants hardly well enough represented. Besides the crotons and palms, the chief subjects were caladiums, dracænas, pillar roses, and Kalanchoe flammea. Third award fell to Mr. W. Vause, Leamington, who associated crotons, palms, pillar roses, liliums, caladiums, and a few orchids in pleasing fashion, but there was a little suggestion of overcrowding. Messrs. Simpson and Son, Brook Street, Selby, were placed fourth, and Mr. G. Cottam, Alma Gardens, Cottingham, fifth.

In the smaller group class, the space occupied being 200 square feet, there were also five competitors, and here Mr. Walton Curtis, gardener to James Blacker, Esq., Thorpe Villas, Selby, was awarded chief honours for an elegant group, in which light pillar roses of Dorothy Perkins, Blush Rambler, and Hiawatha took a prominent part, with crotons, alocasias, cattleyas, odontoglossums, etc.; Mr. W. Holmes, Chesterfield, was second with a light and unusually well-finished group, great care having been taken to make the margins as elegant as the centre; Mr. J. Donoghue was third, and Mr. Vause fourth.

SPECIMEN PLANTS.

Messrs. J. Cypher and Sons, Cheltenham, had matters pretty much their own way in the classes for large specimen stove and greenhouse plants. They were first for nine flowering specimens with big, handsome examples of Erica ventricosa magnifica, E. Cavendishi, Frinciscea eximia, Ixora Shawi I. Williamsi, Pimelia diosmæfolia, Anthurium Scherzerianum, A. S. major, and Azalea Modele; Mr. W. Vause second with smaller examples. For six specimens, Messrs. J. Cypher and Sons were again first with fine ericas and a big Statice intermedia; Mr. W. Vause second. For three specimens, Messrs. J. Cypher and Sons led with Erica Cavendishi, E. ventricosa magnifica, and Anthurium Scherzerianum; Mr. Vause second.

Mr. Vause had the best single specimen stove plant, a big Anthurium Scherzerianum. Messrs. J. Cypher and Sons scored for a specimen greenhouse plant, with a large Erica ventricosa magnifica; and they led in the class for six ornamental foliage plants with giant examples of Kentia Fosteriana, K. Belmoreana, Latania borbonica, Croton Evansiana, and C. Warreni; Mr. Vause second. For three specimens the Messrs. Cypher scored with grand palms and a great bush of Croton Mortefontainensis, with Mr. Vause second.

In the classes for flowering plants of popular florists' flowers, Mr. P. Stancliffe, Solberge, Northallerton, was an excellent first for eight calceolarias; Mr. W. Etty, gardener to the Rev. Canon Argles, St. Clement's Rectory, York, second; and Mrs. Akenhead third. Mr. A. Leetham and Mr. P. Stancliffe were first and second respectively for three herbaceous calceolarias. Dr. R. Appleton, The Bar House, Beverley, led in the open class for eight gloxinias, and was closely followed by Mr. T. F. Wood, Old Nunthorpe, York. Eight tuberous begonias proved another strong and popular class, and here the prize winners in order of merit were Mr. Thos. Winn, Mrs. Akenhead, and Mr. J. S. Linfoot, gardener to Mrs. Ferrier, Fulford Croft, York.

GRAND YORKSHIRE GALA AND FLORAL FETE:
Display of Hardy Flowers by Messrs. Dicksons, Lim., Chester.

ROCK GARDEN CLASS.

Once again the class for "a group of hardy herbaceous and perennial plants, with background of decorative plants, bamboos, etc., with a pool of water nymphæ, water plants, etc., arranged for natural effect, cut flowers allowed," was a great attraction. The space allowed was 30ft. by 10ft.; there were four competitors. Messrs. Jas. Backhouse and Son, Lim., York, were winners of the first prize, and they had a bold rock garden arrangement with a little stream along the front, this running under small stone pathways in several places. The rockwork was crowned with rambling roses, bamboos, Japanese maples, rhododendrons, and eremurus spikes. At either end the descending rockwork was clothed with bamboos, Hydrangea paniculata grandiflora, roses, and liliums. The bold central rockwork contained colonies of saxifragas, campanulas, erigerons, dianthuses, spiræas, etc., with small Alpine conifers on prominent points. In little shady nooks were Cypripedium spectabile, Primula sikkimensis, scolopendriums, and Adiantum pedatum, while on narrow rock ledges were the Edelweiss, alpine phloxes, lychnis, etc., and nymphæas dotted the water. The whole arrangement was extremely pretty, and the water falling into the stream at one end added to the pleasing effect. Messrs. W. Artindale and Sons, Sheffield, were placed second. They had a deep rocky valley with a pool at the bottom, and across the valley was a rocky bridge draped with single rambling roses that seemed rather out of place. Maples and roses and eremuri provided the background, and small conifers were largely used in the general scheme. In the foreground, and close to the water, were bold colonies of Primula japonica in a variety of colours, and P. sikkimensis, while a little higher up were Incarvillea grandiflora, Phlox canadensis, saxifragas, lithospermums, campanulas, and Viola cornuta. Mr. S. Pickering, Rosslyn Street, Clifton, York, was third, and had a rather large central pool with irises and hemerocallis as a leading feature; Mr. G. Cottam, Alma Gardens, Cottingham, had a water garden, with irises, funkias, campanulas, and spiræas boldly grouped in and around the large pool of water.

ROSES.

Cut roses were better than they have been at York for several years. In the premier class for seventy-two blooms Mr. J. D. Hutchinson, Kirby Moorside, won chief honours, and his finest examples were of Caroline Testout, Frau Carl Druschki, Maréchal Niel, Mdme. Jules Gravereaux, Etienne Levet, Mrs. J. Laing, and Prince Arthur. There were five competitors, and the later awards fell in order to Mrs. Mainwaring, The Lodge, Bembridge, Isle of Wight; Messrs. G. Mount and Sons, Canterbury; and Messrs. D. Prior and Son, Colchester. For forty-eight blooms, four entries, Messrs. D. Prior and Son, Colchester, led the way, and showed good flowers of White Maman Cochet, Lady Mary Fitzwilliam, Bessie Brown, Dr. Campbell Hall, Duke of Edinburgh, Richmond, and Medea; Mr. George Prince, Longworth, Berks, second; Messrs. G. Mount and Sons, third. Messrs. W. and

J. Brown, Stamford, scored for thirty-six roses, and showed good blooms of Maréchal Niel, and Souvenir de Pierre Notting; Messrs. G. Mount and Sons, second; Messrs. D. Prior and Son, third; and Mr. G. Prince, fourth.

Mr. G. Prince led for two dozen roses, and his set consisted largely of tea-scented varieties; Messrs. D. Prior and Son, second, and Mrs. Mainwaring, third. Mr. Prince was also first for eighteen blooms, and here he had Comtesse de Nadaillac and White Maman Cochet in good form; Mrs. Mainwaring, second, and Messrs. D. Prior and Son, third. For a dozen white or yellow roses, Mr. G. Prince scored with The Bride, Souvenir de S. A. Prince, Mrs. Aaron Ward, White Maman Cochet, and Comtesse de Nadaillac; Messrs. G. Mount and Sons, second, and Messrs. D. Prior and Son, third. In the amateurs' class for eighteen blooms Mr. W. Hutchinson, Kirby Moorside, led from four other competitors, but the flowers were, on the whole, poor.

ORCHIDS.

Orchids were unusually well shown, and there was an excellent competition in most classes. There were two entries in the class for a table of orchids, plants, and cut flowers, tastefully disposed with ferns and moss. The best was from Messrs. J. Cypher and Sons, Cheltenham, who were awarded the first prize for a pretty exhibit composed of odontoglossums, oncidiums, cattleyas, sobralias, brassias, Vanda teres, and a few choice cypripediums. Mr. W. Bolton, Wilderspool, Warrington, was placed second, and he had a rather ugly arch of netting covered with moss, into which orchid flowers were inelegantly stuck.

GRAND YORKSHIRE GALA AND FLORAL FETE:
Display of Perpetual Carnations, by Messrs. Young and Co., Hatherley, Cheltenham.

Messrs. J. Cypher and Sons were placed first for ten orchids, with handsome examples of Miltonia vexillaria, Lælia purpurata, Cattleya gigas, Lælio-cattleya Canhamiana, L.-c. C. superba, L.-c. Aphrodite, L. tenebrosa, Oncidium macranthum, Epidendrum prismatocarpum, etc.; Mr. Barker, gardener to W. T. Burkinshaw, Esq., West Hill, Hessle, second, his Cattleya Jupiter and L.-c. Aphrodite being very good; Mr. W. Bolton, third. Messrs. Cypher were also to the front in the class for half a dozen specimen orchids, and here their leading plants were L.-c. Aphrodite, L.-c. Canhamiana, and L. purpurata. Mr. J. T. Barker, second; and Mr. Vause, fourth.

The best three orchids were from Messrs. J. Cypher and Sons, who had Miltonia vexillaria, Odontoglossum crispum, and L.c. Canhamiana, the latter carrying fourteen flowers; Mr. J. T. Barker, second; Mr. Jas. Sunley, third. The best specimen orchid was a pretty plant of Lælia tenebrosa Walton Grange var., from Mr. J. T. Barker, who was also first in the amateurs' classes for half a dozen orchids and for three orchids, but several of his plants showed evident signs of travel.

FLORAL DESIGNS.

Messrs. Perkins and Sons, Coventry, led for a pair of ball bouquets, with elegant and brilliant designs in cattleyas, odontoglossums, oncidiums, etc.; Messrs. Aldis and Rowntree second. The same order of merit was followed in the class for two hand bouquets, both firms showing charming designs in orchids. For one bouquet Messrs. Perkins and Sons and Messrs. Aldis and Rowntree were first and second respectively for orchid bouquets, with Messrs. E. J. Simpson and Son third with a bouquet of cattleya flowers. For a bouquet of roses Messrs. Aldis and Rowntree were first, Messrs. Perkins and Sons second, and Mr. F. M. Bradley, Peterborough, third.

Messrs. Perkins and Sons, Coventry, were easily first for a basket, with odontoglossum and cymbidium spikes and cattleyas and cypripediums. Mr. F. H. Ward second with pink carnations. Messrs. Perkins and Sons were also victorious in the class for two bridal bouquets; Messrs. R. Simpson and Son, second; and Messrs. Aldis and Rowntree, third, white orchids, carnations, and lily of the valley being the flowers chiefly employed.

HARDY FLOWERS.

The collection of hardy border flowers arranged on a space of 15ft. by 6ft. made a magnificent display,as there were five of them, and they provided a grand bank of brilliant colour. Premier award was won by Messrs. W. Artindale and Son, Nether Green, Sheffield, who put up great sheaves of fresh flowers of Eremurus himalaicus, Verbascum Caledonia, Lilium longiflorum, Lupinus polyphyllus roseus, Spiræa Queen Alexandra, Pæony alba maxima, fine single and double pyrethrums, Incarvillea Delavayi, and Spanish irises; Messrs. Harkness and Son, Bedale, came second, and they had poppies finely represented; Messrs. G. Gibson and Co., Leeming Bar, third; and Mr. G. Cottam, fourth.

Messrs. G. Gibson and Co., Leeming Bar, scored for two dozen bunches of hardy flowers, their chief kinds being the Rose Queen lupin, pyrethrums, Geranium ibericum, verbascums, and poppies; Messrs. G. Longster and Sons, Derwent Nurseries, Walton, second; Messrs. Harkness and Sons, third; and Messrs. W. Artindale and Son, fourth.

In the twelve-bunch class Mr. W. Hutchinson was to the front with Incarvillea Delavayi, Iceland poppies, Hemerocallis flava, liliums, lupins, pyrethrums, and pæonies; Mr. M. Furness, Monk Fryston, South Milford, second; and Mr. A. R. Searle, gardener to the Duke of Northampton, Castle Ashby, Northampton, third.

Mr. Walter Pybus, Monkton Moor, Leeds, led for a group of twenty alpine or herbaceous plants in pots, Mr. Pickering coming second, and Mr. J. Nicholson third.

PELARGONIUMS.

The pelargoniums made a rare blaze of colour, but they were not represented in the wonderful style that prevailed at York a score of years ago. On this occasion Mr. G. Lee, York, led for six show pelargoniums with low, flat-trained examples of Duchess of Bedford, Madame Thibaut, Mrs. Roylett, T. Dedd, Kingston Beauty, and W. E. Gladstone; Mr. W. F. Crowther second, and Mr. H. Pybus third. For a dozen zonal or nosegay varieties, Mr. H. Pybus, Monkton Moor, Leeds, was placed first for freely bloomed, medium-sized specimens, Circulater, Mrs. Newdigate, Pres. Thiers, Mrs. Ketley, and Distraction being his best varieties; Mr. James Sunley second. Mr. Pybus was easily first for six specimens, his Mrs. Ketley, Mrs. Newdigate, and Rev. Atkinson being smothered with their gay blossoms; Mr. G. Lee second, and Mr. J. Sunley third. For three zonals Mr. H. Pybus scored with Mrs. Ketley, Mrs. Paul, and D. Kotch; Mr. Lee second. For six double varieties the awards fell in due order to Mr. J. W. Clark, Skelton Street, York; Mr. W. F. Crowther, and Mr. H. Pybus. All staged low, flattish specimens.

GROUPS OF FLORISTS' FLOWERS.

Premier award for a collection of roses in pots, grouped for effect on a space 15ft. by 7ft., was won by Mr. J. E. Skaife, Clarence Street, York, who had a charming exhibit, with pillars and weeping standards of Dorothy Perkins over dwarf bushes of popular H.P. and H.T. varieties, with an edging of the dwarf Mrs. Cutbush; Mr. W. Todd, York, a good second, with a pretty background of rambling roses; and Mr. W. Longstaffe, Garth Terrace, Burton Lane, York, third. In the class for a group of twenty roses, in pots, Mr. H. Pybus was easily first, with Mr. J. E. Skaife second, and Mr. W. Longstaffe third.

For a collection of plants in or out of bloom, arranged for effect on a space of 12ft. by 6ft., Mr. F. H. Ward, Scarcroft Nursery, York, led with a bright display of carnations, liliums, rambling roses, and odontoglossums over a groundwork of schizanthuses and ferns; Mr. J. Blacker, Selby, second; and Messrs. R. Simpson and Son, Selby, third; there were six competitors. The best group of pelargoniums was staged by Mr. J. R. Wedgwood, Burton Lane, York, who was followed in order by Mr. G. Lee and Captain Walker. Mr. J. Donoghue scored for a group of carnations with Malmaisons and Yaller Gal in fine form. Mr. Walls, gardener to Mrs. Craven, Moslyn, The Mount, York, had the best group of gloxinias, and his plants and flowers were finely developed; Captain Walker second, and Mr. T. Winn third.

Tuberous begonias were largely shown, and well; Mr. T. Winn, Ratcliffe Street, York, was first for a group that contained ample evidence of high cultural skill; Mr. Leadill, gardener to Mrs. M. G. Akenhead, Acomb, York, second; and Mr. T. Douthwaite, gardener to Miss Barstow, Garrow Hill, York, third. Calceolarias proved another strong class, and there were numerous groups of these very attractive flowers; Mr. A. Leetham, Mr. P. Stancliffe, and Mr. J. Rowntree had excellent displays, and received prizes in the order given.

FRUITS AND VEGETABLES.

The chief fruit class was for a decorated table of ripe fruit, the space allowed being 10ft. by 4ft. 6in., and not more than fourteen or fewer than ten dishes permitted. The

(Continued on page 477).

DOUBLE-FLOWERED IVY-LEAVED PELARGONIUMS.

The different pelargoniums of the Show and Fancy sections, once so popular, have within the last few years almost dropped out of cultivation. As a set-off, however, the members of the ivy-leaved class, with double or semi-double flowers, have made great headway in popular favour, and deservedly so, as they possess many desirable qualities, and can be put to a great number of uses.

The first of this class originated in Germany, namely, the variety Konig Albert, which was distributed in the year 1875. It was sent out at 15s. per plant, and large numbers were sold at that rate. The difference in the price of new plants then and at the present time is very marked, for many new pelargoniums were sold at a guinea each, a sum which would now be simply prohibitive. The flowers of the variety Konig Albert were of a deep lilac tint, and the new varieties sent out for three or four years after were very similar. By the early '80's, however, a much wider range in colour and in habit was to be found among the ivy-leaved pelargoniums, and they then entered upon a period of popularity which has gone on increasing until the present day.

Vast numbers in all sizes and stages are now brought into Covent Garden Market, and may be met with in every London street. Cultivators for market grow only the varieties that will sell best, and it is very singular that the three most popular kinds, namely, Galilée, Madame Crousse, and Souvenir de Charles Turner, were sent out in the '80's, the most recent of the three being Galilée, which was distributed in the Jubilee Year, 1887. A great number of new varieties have been raised since then, but the position of these old kinds appears to be unassailable. I recently noticed the mention of a comparatively new variety, Countess de Grey, which was said to have every indication of superseding Madame Crousse, but this I should very much doubt.

As above mentioned, these ivy-leaved pelargoniums can be put to a great number of different uses. In the first place, their more or less procumbent habit renders them of great value for growing in hanging baskets, and also for furnishing large outdoor vases during the summer months. For clothing greenhouse walls or pillars therein the more vigorous kinds are well suited. Again, these pelargoniums are extremely useful for growing in window-boxes, draping balconies, or for purposes such as these and where a succession of flowering plants has to be maintained throughout the year, they can be depended upon to contribute their share, either in five-inch pots, as the market grower treats them, or as larger examples.

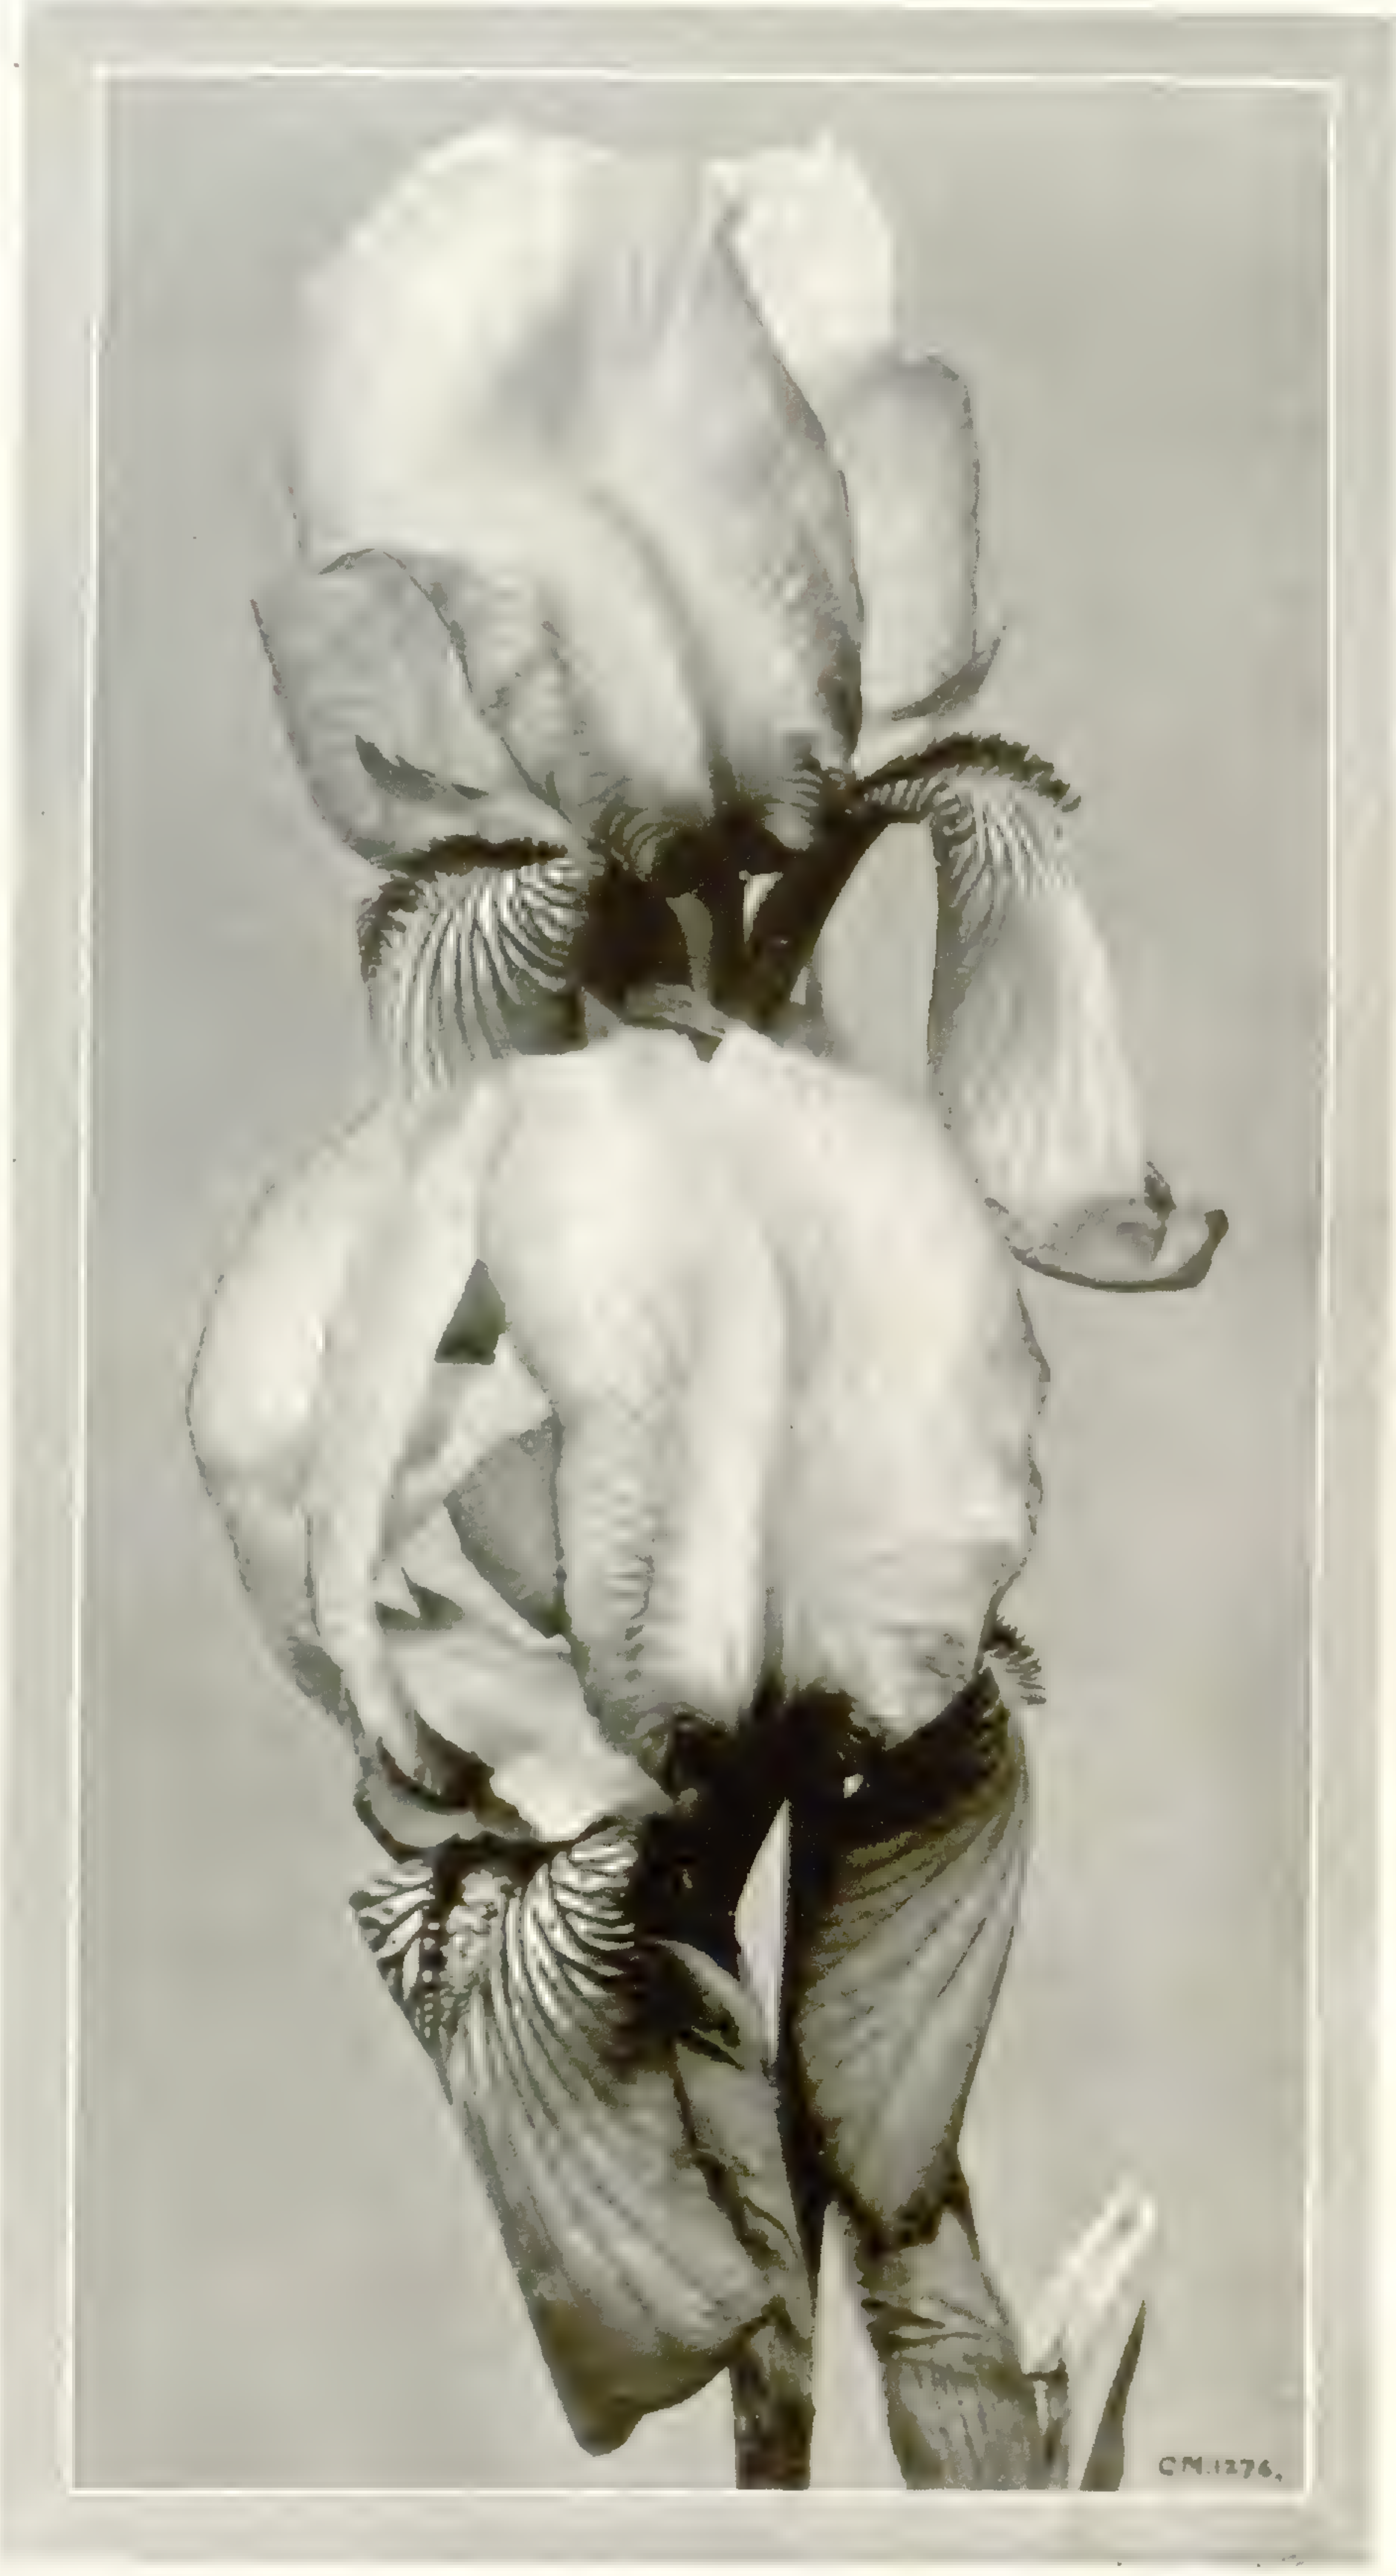
Trained around a few sticks, these ivy-leaved pelargoniums will, if shifted into ten-inch pots, soon form good-sized bushes, which will continue to flower throughout the entire season. Even now the possibilities of these plants are by no means exhausted, as some of them are very satisfactory when bedded out during the summer months, and where the custom prevails of plunging flowering plants at this season in the open turf, large examples of ivy-leaved pelargoniums readily lend themselves to this mode of treatment, flowering freely till the nights get cold.

With the exception of aphides, insect pests give but little trouble, and the "green fly," as it is popularly termed, can be readily kept down. All the varieties quickly respond to stimulating manures, but care should be taken not to carry feeding to excess, otherwise it is very apt in some instances to set up a diseased, gouty condition, which is difficult to cure. When all are treated alike, some varieties are far more liable to this ailment than others.

As varieties are quite numerous, and different tastes prevail, it is impossible to make a selection to suit everyone, but the following are all good and distinct: Carlos Uhden, rich rose-pink; Colonel Baden Powell, blush-lilac; Corden's Glory, scarlet; Corinthienne, pale blush, feathered crimson; Devonshire Lass, salmon-pink; Galilée, bright magenta-rose, very good habit; Giroflée, magenta-purple; Gringoire, crimson-purple; Hector Giacomelli, pink, blotched crimson; Jeanne d'Arc, almost white; Leopard, lilac-pink, heavily blotched and feathered with crimson, very distinct; La France, lilac; Madame Crousse, soft satiny-pink; Mrs. Hawley, rosy-cerise; Murillo, deep crimson; Princess Victoria, very pale lilac; Queen Alexandra, blush-pink, marked crimson on upper petals; Queen of Roses, bright rose; Resplendent, bright crimson-scarlet, very free-growing; Ryecroft Surprise, synonymous with Beauté Supréme, salmon-pink; Sabrina, light scarlet, very large, especially good for walls; Scarlet Crousse, bright red; Souvenir de Charles Turner, deep pink; The King, dark cerise; and The Queen, soft salmon.

Besides these there are a few obtained by crossing the zonal and ivy-leaved sections, the result being varieties about midway in habit between the two groups. One of these, namely Achievement, with salmon-pink flowers, is much grown; others of the same class are Millfield Gem, which is similar to Alliance, blush; James T. Hamilton, carmine-crimson; Chingford Rose, lavender-rose; and Papa Chapfer, deep scarlet.

W. T.



IRIS ISOLINE.
A.M., R.H.S., June 7. Messrs. R. Wallace and Co., Colchester. Flowers soft yellowish bronze, rose and orange.

Roses may be grown to perfection by following the instructions given in Roses and their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post in box 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

NEW PLANTS, ETC.

◆

ODONTIODA ST. FUSCIEN VAR. IMPERATOR.

A very fine variety of the cross between Cochlioda Noetzliana and Odontoglossum Adrianæ. It has large odontoglossum-like flowers, borne on a spike of considerable strength. There were fifteen flowers, all of a bright and effective crimson-red colour, with mottlings on a ground colour of a buff or creamy shade. F.C.C., R.H.S., June 7. Mons. Henri Graire, St. Fuscien, Amiens.

ODONTIODA GATTONIENSIS. ROSEFIELDIENSIS.

A charming and brilliant variety of the hybrid from Cochlioda Noetzliana and Odontoglossum Kegeljani (polyxanthum). The original hybrid was raised at Gatton Park, Reigate, but the present form is a great advance. The flowers are of good size, and of a curious scarlet shade, the colour being so "thin" in some parts of the bloom as to show the underlying yellow colour. In a good light the flowers are extremely effective. The creamy-white lip is stained with red. A.M., R.H.S., June 7. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.

MILTONIA VEXILLARIA VAR. SNOWFLAKE.

A very beautiful variety, with flowers of largest size, and pure white, save for the yellow blotch at the base of the lip. A.M., R.H.S., June 7. Lieut.-Col. Sir George Holford, K.C.V.O. (grower, Mr. Alexander), Westonbirt, Gloucester.

IRISES.

Italia.—A very fine, large-flowered hybrid, raised by the late Sir Michael Foster. The colouring is deep purple-blue, paler on the falls, and there is a golden crest or beard. A.M., R.H.S., June 7. Messrs. R. Wallace and Co., Colchester.

Isoline.— Another beautiful hybrid, with fine spikes of large flowers. The standards are very broad, yellowish-bronze with a pink suffusion, and the falls are deep rose and soft orange, while the crest or beard is dark orange. A.M., R.H.S., June 7. Messrs. R. Wallace and Co., Colchester.

CARNATIONS.

Mrs. Everard Martin Smith.—A splendid large-flowered border variety, of great substance, grand form, and the purest whiteness. A.M., R.H.S., June 7. Mr. Charles Blick, Hayes, Kent.

Queen Mary.—A richly scented border carnation of deep maroon colour. It is said to be distinctly perpetual in growth and bloom during the summer season. A.M., R.H.S., June 7. Messrs. W. Cutbush and Son, Highgate, N.

Edith Waters.—A fine perpetual-flowering variety, of large size and good substance and form. The colour is similar to that of Mrs. T. W. Lawson, but deeper and brighter. A.M., R.H.S., June 7. Mr. C. F. Waters, Balcombe, Sussex.

SWEET PEAS.

Prince of Orange.—A splendid waved variety, of large size, and of a rich cerise-scarlet shade of colour. A.M., R.H.S., June 7. Mr. T. Stevenson, Woburn Place Gardens, Addlestone.

Marjory Hemus.—In this variety the colouring is rich lavender-blue, and white. A.M., R.H.S., June 7. Miss Hemus, Upton-on-Severn.

Paradise Cerise.—A pretty and waved sweet pea of good size, but the colour is rich pink or salmon-rose, rather than cerise, at least that is our idea of the colour. A.M., R.H.S., June 7. Miss Hemus, Upton-on-Severn.

ROBINIA KELSEYI.

A useful hardy shrub or small tree from North America. It has elegant leafage, and produces its deep rose-coloured flowers in short racemes on the previous year's growths. A.M., R.H.S., June 7. Messrs. Robert Veitch and Son, Exeter.

CLIVIA KING GEORGE V.

An effective variety, with large trusses of yellow flowers. We doubt if this is sufficiently distinct from other of the yellow-flowered forms in cultivation. A.M., R.H.S., June 7. Mr. G. W. Miller, Wisbech.

HELIOTROPE FAVOURITE.

A fine variety, with large, abundant leafage, crowned by very large heads of pale heliotrope-coloured flowers. Very fragrant. A.M., R.H.S., June 7. King's Acre Nursery Company, Hereford.

PELARGONIUM WHITE QUEEN.

A single pure white variety, of compact habit and very free flowering. A.M., R.H.S., June 7. Messrs. James Veitch and Sons, Lim., Chelsea.

PYRETHRUM SNOW QUEEN.

A single variety of great beauty; the flowers are large, pure white, with a quite pale cream-yellow disc. A.M., R.H.S., June 7. Messrs. Kelway and Son, Langport.

MERTENSIA ECHIOIDES ELONGATA.

This very pretty hardy plant grows about a foot high, and is of tufted habit. It is said to grow freely if given moderate shade and plenty of leaf-mould. The drooping flowers are rich blue. A.M., R.H.S., June 7. Messrs. Bakers, Wolverhampton.

A STROLL ROUND MY FERNERY.

To the British fern lover the month of May is undoubtedly one of the most interesting periods of the year. At that time, if the owner of the fernery be one of the thorough-going kind—that is, one who goes in for selective cultivation and improvement of type—he will begin to see the results of his previous year's sowings, or in the case of slower-developing varieties, those of the year before that; and he will be unfortunate indeed if nothing of special interest turns up. If he be a fern-hunter as well, and has secured any prizes, or possible prizes, last season, these will now be displaying their new growths, and either enchanting him by confirmation of his dearest hopes, or, on the other hand, as will happen to the best regulated expert mind, he may be disenchanted by finding his swan to be but a goose, and possibly a second-rate goose at that.

Happily, however, the stroll which I am describing presents but few disappointments amid a number of successes. First of all, the new section of Shield Ferns, raised from Polystichum aculeatum pulcherrimum, among which two have already received first-class certificates, is surpassing all expectations, and I have now the pleasure of surveying a row of more than a dozen most beautiful forms, displaying very varied characters, and inheriting—which is a very great point—the particularly robust constitution of the parent. One of the best originated in the sowing made by Mr. C. B. Green, amongst the batch he raised, and from which he kindly gave me a bulbil: this has yielded me a very string plant, and, curiously enough, a prospect of a good batch as well, since the said bulbil broke in the first place into no less than seven centres, of which six were successfully made into independent plants. Five of these have retained their individuality, developing normally into single crowns; but of the other two, one has its crown split up into a bunch of secondary ones, apparently about a dozen, and another has two of its fronds with small bunches of bulbils a short way up, so that at least a score of this beautiful variety are in prospect already. Strange to say, the original plant has shown no signs of bulbiferousness, save in the one instance.

Thanks to the cool and moist spring, the development of all the ferns in my collection of some 500 varieties, and far more specimens, has been greatly favoured, and in all directions the growth is vigorous and healthy. The superbum section of Lady Ferns, which originated here, is simply magnificent. Athyrium f.f. plumosum Druery, the queen of the collection, is already four feet high, and its numerous sisters, crested and uncrested, surround it with a galaxy of beauty.

These, however, are old friends now, and by way of diversion I turn to some possible new ones, a pan of seedlings of a prettily-crested Marsh Fern (Lastrea thelypteris), found by a lady in the United States, but of which I made a sowing, to acquire, if possible, a British-born improvement. As a result, among some scores of replicas of the parent form and a few normals, I have four young plants, which, instead of small tassels at tips of fronds and side divisions, are practically all crest, and promise to be great acquisitions in that species, of which hitherto there has been no British variety found. Right and left of me, as I stand, there are two splendid specimens of the Male Fern. The King of the Male Ferns, with a trunk nearly two feet high, and a circlet of fifteen finely-tasselled four-feet fronds, and L. f. a. polyductyla Wills, with rather less than five-feet fronds, and considerably larger tassels, are two of the finest and boldest forms we have. Opposite me is a recent acquisition, no less than an actual division of the original find of the clarissima Lady Fern of Col. Jones, upon which "apospory" was first discovered over a score of years ago, the result of which was the raising of some hundred plants of a hitherto barren fern.

These plants so raised are now in every collection of note, but, curiously enough, always develop a twist in the fronds, while the original has them not only perfectly flat but much more robust, reaching nearly five feet in length and 26 inches wide, a truly regal fern, which I have longed for twenty years to acquire, but only did so this year by favour of Miss Jones. The more interesting part of my fern collection lies along the left-hand staging, devoted mainly to my own "finds," or others of special interest, the former numbering some dozens, each with its interesting record. We may, however, mention A. ff. revolvens, with almost tubular fronds and ringlets at all tips. A. ff. cristatum Kilrushense, with long pendulous tassels, admittedly the most beautifully crested form found wild; an improved form of Athyrium ff. plumosum Drueryi, a tasselled form of A. ff. Kalothrix, a ramo-cristata variety of Hartstongue found in Cornwall, and several other good "sports" of the same species found there and elsewhere. Lastrea montana plumosa Drueryi appears as a fine specimen, showing how well this neglected species is adapted for pot culture under glass. On the opposite side a series of shelves afford accommodation for a representative group of Polypodium vulgare, some twenty-five of the best varieties figuring there. Since, however, between 500 and 600 pots and pans, mostly containing different varieties, are under this glass roof, to say nothing of the plants in the open, it is clear that nothing but a faint idea can be conveyed of the interest involved in a stroll round and about it, as contrasted with what would be experienced in a popular fernery containing, at the best, perhaps a dozen of the common kinds, repeated by the score.

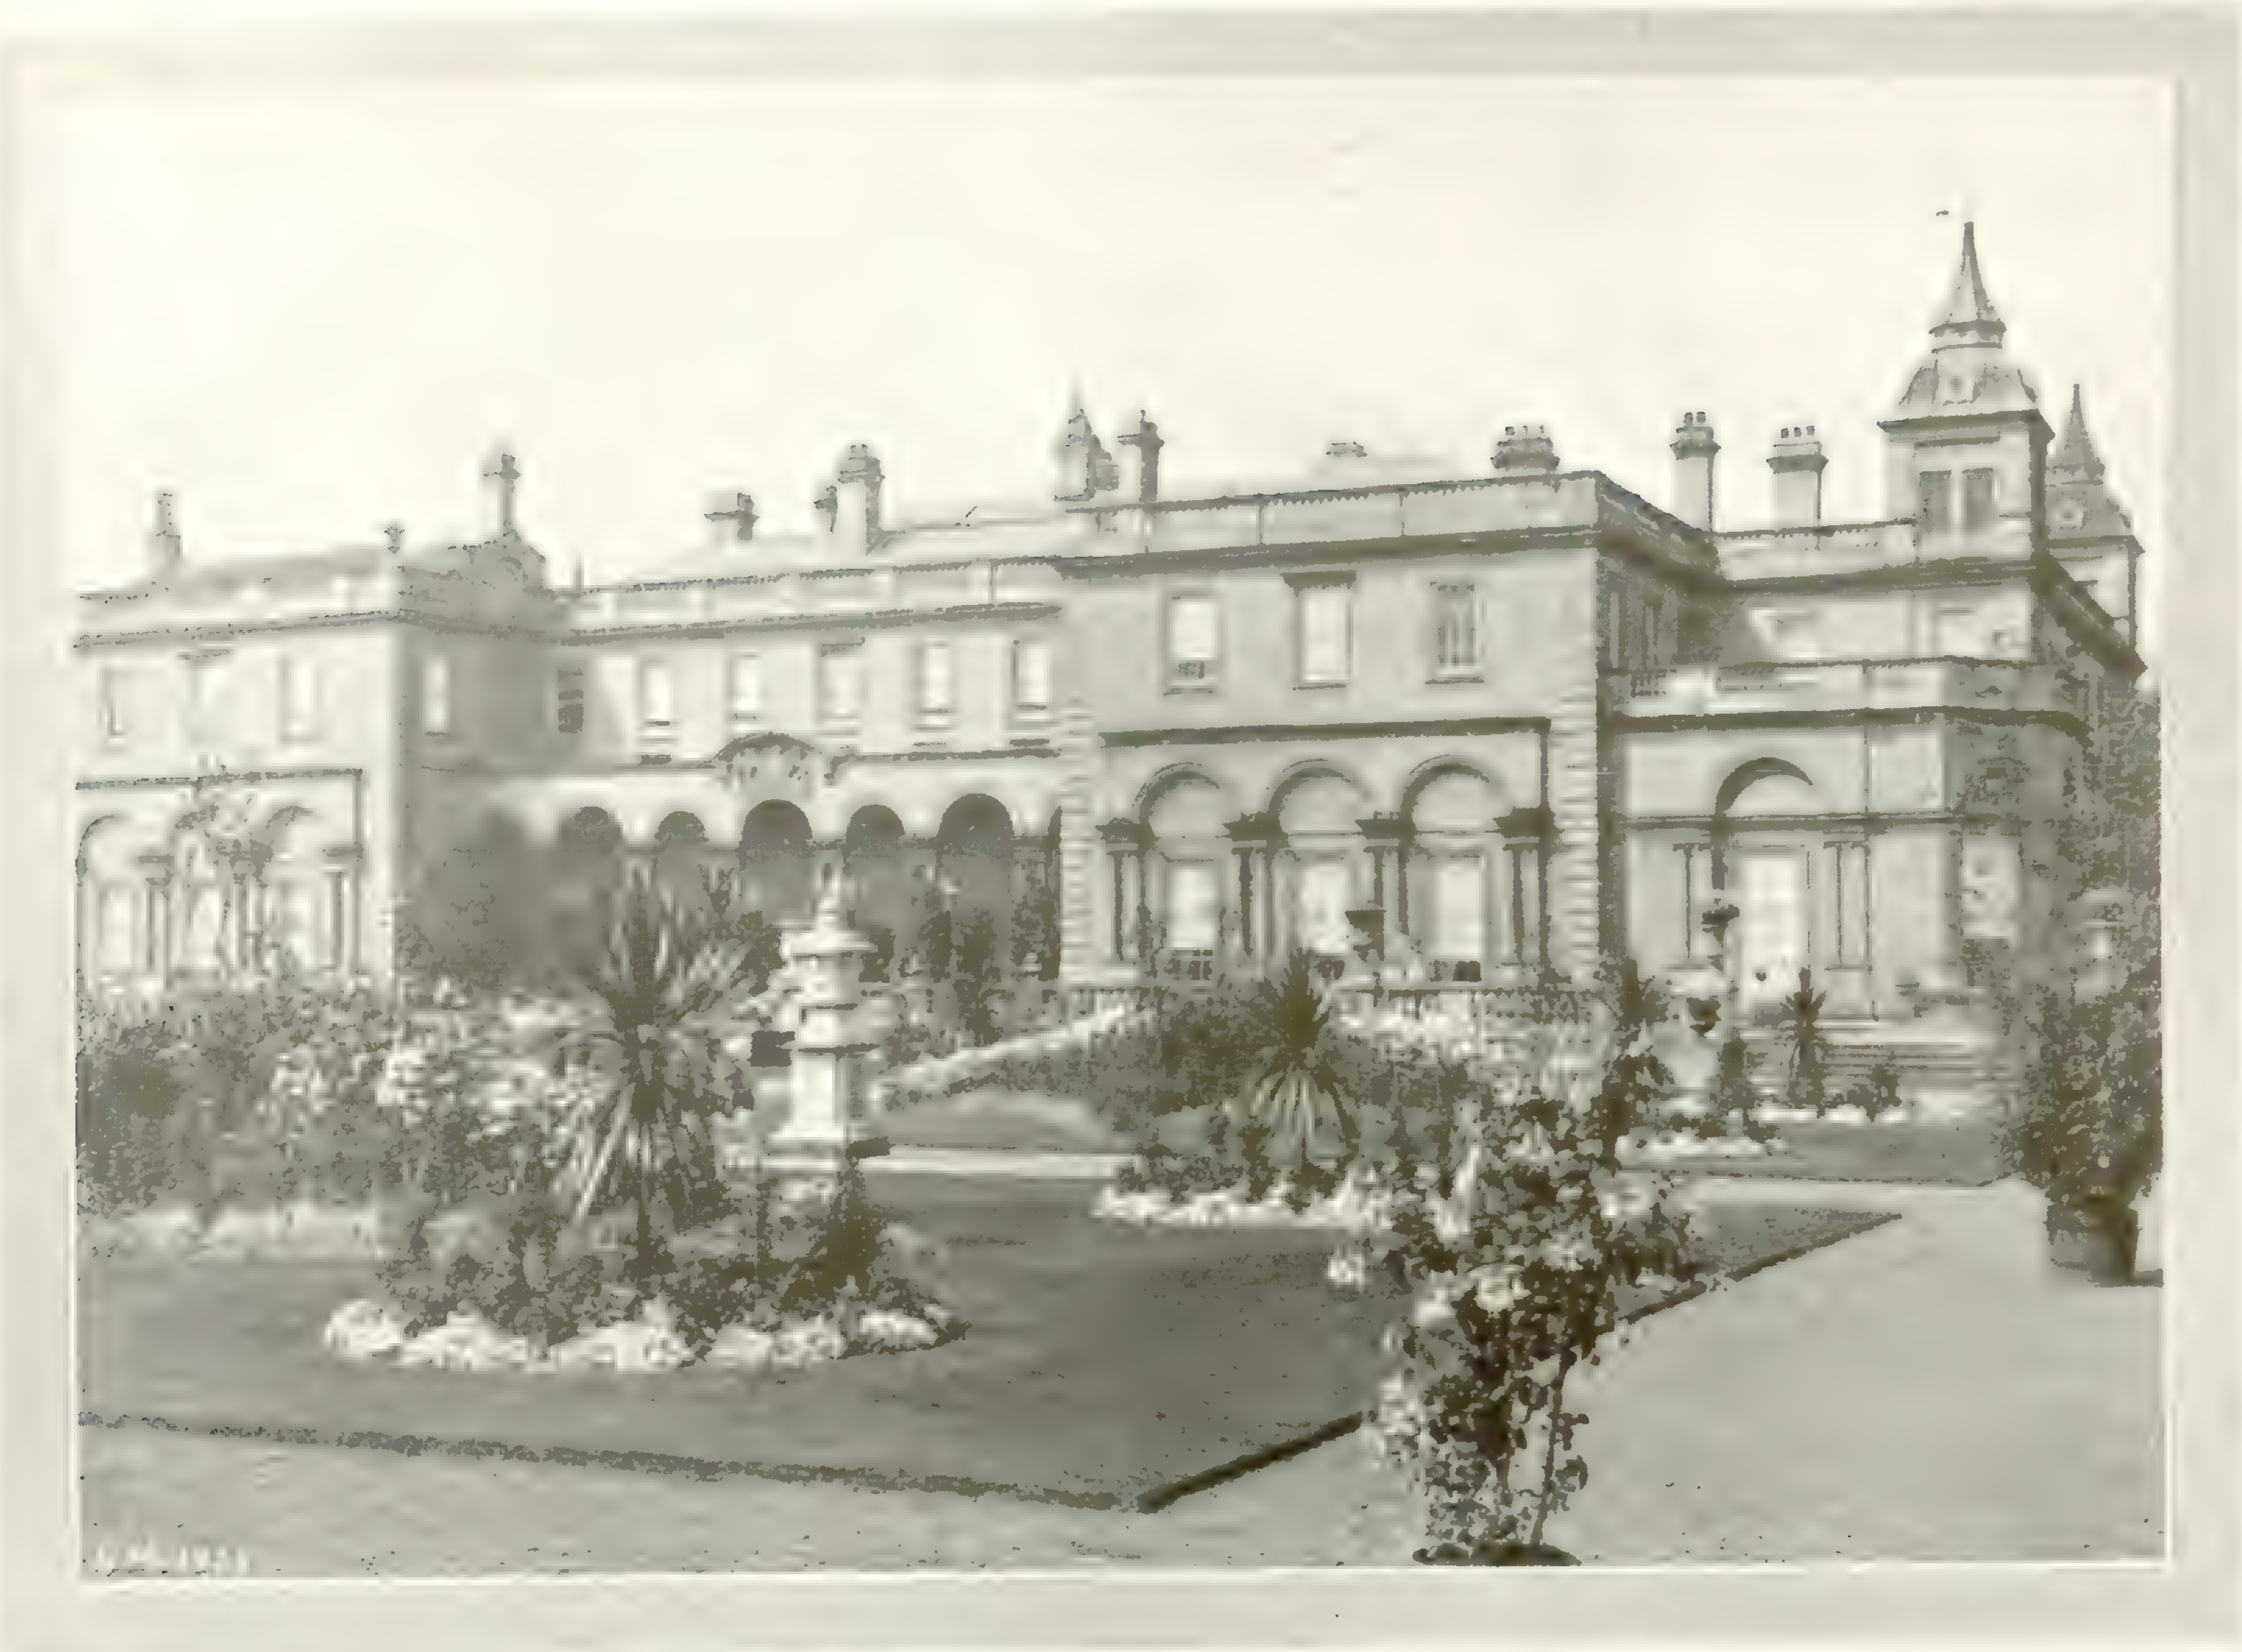
Address ....



MANSION AND PORTION OF ITALIAN GARDEN, CLUMBER.

SOME GARDENS IN THE DUKERIES—II.

Clumber.

Situated some four miles distant from Worksop, Clumber, the seat of the Duke of Newcastle, is rich in attractions to the visitor, whatever may be the trend of his taste. The scenery of the district is of surpassing beauty, the park is spacious and finely wooded, the mansion stately, and the gardens extensive, admirable in design, and highly kept, the terraces affording some of the finest examples of the Italian style, as applied to garden design, to be found in the United Kingdom. The estates of Clumber and Welbeck are contiguous, and lie to the east and west respectively of the road between Worksop and Budby and Ollerton. As in other parts of the Sherwood Forest, the road by which Clumber is reached is finely wooded on either side, and presents some charming glimpses of forest scenery. From the North Lodge to the mansion the distance is about one mile, and in passing along the drive the picturesque group of trees and the large tracts of woodland afford a succession of delightful pictures. The park abounds in oaks, limes, and other trees of noble proportions that thrive in the district, some dating back to the time when Sherwood Forest was in its primeval condition, or had not undergone any material change, while others are of a size that shows they have been planted during the period which has elapsed since the mansion was built, nearly one hundred and fifty years ago.

The magnificent park has an undulating surface, and the mansion, in common with many other great houses built in the second half of the eighteenth century, occupies a position low enough down for water to be used in beautifying its surroundings. In this case water has been used with singularly good effect, and the combination of lake and wood, of green turf and tastefully coloured parterres, has been so skilfully accomplished as to convert the environment into a perfect fairyland. The fine mansion loses somewhat in the nobility of its proportions from having slightly rising ground around it, but certainly not sufficient to detract in the slightest degree from the glorious picture in which it is the central object. There are two terraces, the one which extends the whole length of the mansion, and is shown, or, rather, a part thereof, in the illustration of the latter, and the east terrace, to the right of the building. The principal terrace is finely decorated with marble vases, and has a fountain basin twelve and a-half feet in diameter, formed from a solid block of marble. Opposite the centre of the mansion are flights of steps leading down to the water of the lake, which washes the base of the wall supporting the handsome balustrade. In the embellishment of the flower beds on the terrace Mr. S. Barker, the able gardener, uses both flowering and ornamental-leaved plants in due proportions, and with good effect, and note was made of the beds of heliotropiums as being of special excellence. The effect produced by the plants that are bedded out is materially enhanced by the fairly free use of tall dracænas and bamboos, and specimen hydrangeas, fuchsias, and other subjects grown for their flowers, and occupying large pots. The east terrace, to the right of the mansion, is freely embellished with handsome vases, and has a fountain in the centre. As one would expect, the scheme of decoration differs materially from that of the terrace on the west front, and some of the hardy perennials of medium height are most successfully employed.

One of the great charms of the environment of Clumber is the large lake, which appears to rise away in the woods to the south-west, and skirts the pleasure grounds to the south of the mansion, and extends somewhat beyond the north end of the terrace. It is about two miles in length, with a proportionate width, and in admiring this fine sheet of water one is much impressed by the taste and judgment with which the margin was planted when the lake was formed. The pleasure grounds extend for a considerable distance south of the mansion, and on the margin of the lake is the Lincoln Terrace, which is many hundreds of yards in length, and constitutes a feature of much beauty. As will be seen from the accompanying illustration, this is freely embellished with handsome vases and urns, and with these are associated large flower beds that during the summer months are bright with colour, or contain masses of plants remarkable for the beauty of their leaves. There are to the left tall, finely proportioned Irish yews that carry the eye from the formality of the vases and flower beds to the masses of handsome shrubs that clothe the slopes to the left. To the left also are handsome coniferous trees of many kinds, and in a high state of development, and prominent among them are numerous specimens of the Cedar of Lebanon, which are equally remarkable for their size and handsome shape. Deciduous trees are not less remarkable for their variety and excellent growth, and as the many fine kinds crowd upon the memory it is impossible to avoid a strong feeling of regret that it is not possible to refer to them in some detail

The kitchen garden, with the fruit and plant houses, is some distance from the mansion, and here also we find abundant evidence of the appreciation in which flowers are held at Clumber, and also of Mr. Barker's skill in their cultivation. The kitchen garden, as befits so important an establishment, is of large area, and extending through the whole length is a breadth of turf flanked by broad borders of hardy herbaceous plants, which throughout the summer months yield a wealth of flowers The kinds that have found their home within these borders have been selected with due regard to their vigour of constitution and their capability for giving an abundance of flowers, but the importance of high quality has not been overlooked In other words, the borders are filled with plants in which constitutional vigour, freedom of flowering, and beauty, are happily combined. Especially noteworthy in the borders are the herbaceous phloxes, hollyhocks, of which there are excellent selections, for the conditions that obtain are favourable to the production of fine spikes and the full development of the rich colouring characteristic of so many of the finer varieties. In another part of the garden we find that sweet peas are largely grown, and that Mr. Barker is not only fully acquainted with the best varieties, but well versed in the practice by which continued supplies of splendidly developed flowers are obtained. He evidently recognises the necessity of deep digging, liberal manuring, the avoidance of overcrowding, and the early removal of seed pods, for only by the observance of these essentials to successful practice could such splendid results as those at Clumber be obtained. Not less successfully are chrysanthemums grown in pots, and of these the collection includes about fifteen hundred plants, comprising the varieties best suited for decorative purposes, either as plants or cut blooms. Roses are also well represented in those parts of the kitchen garden devoted to flowering plants, and among the ramblers the popular Dorothy Perkins was producing a rich display of flowers that will linger long in the memory. Especially worthy of note are standards on seven-feet stems, these being most beautiful and effective, and find much favour at Clumber.

Under glass the cultivation of carnations forms a strong feature, and in the several houses devoted to them it was seen that the best of the Malmaisons and the finest of the perpetual-flowering varieties are equally appreciated and successfully cultivated. To give the names of those that attracted attention by reason of their merits would be to enumerate the fine varieties that have from time to time had attention directed to them in these pages within a recent period. Carnations are also largely grown in the open, and we made special note of a large bed of border varieties, consisting of about equal numbers of the best of those that have been distributed under name, and selected seedlings. The plants were bearing an enormous crop of flowers, and it could be readily seen how useful such beds must be where, as here, large supplies of flowers are in constant demand.

Stove and greenhouse plants are grown extensively and well, and, as will be readily understood, such kinds as are especially suitable for indoor decorations are the most extensively cultivated. Quite recently several new span-roof plant houses have been erected by Messrs. Foster and Pearson, of Beeston, and in addition to substantiality of construction and elegance of design, for which this firm is so well known, they are ventilated by a system which is at once simple and efficient, and is regarded with much favour by Mr. Barker. Reference has been made to several features formed by flowering plants, and mention must be made of the success that is achieved in the frame culture of violets. These fragrant flowers are highly appreciated at Clumber, and to produce the requisite supply of blooms a large area of the frames is devoted to them. Both single and double varieties are included in the selection, and from early in the autumn until the spring season is well advanced there is no shortage in the supplies.

The fruit houses are mostly of rather large size, and form a remarkably fine range several hundred yards in length. One of the finest houses, if not the finest, that was entered is devoted to peaches and nectarines, and to save repetition it should be mentioned that four houses are devoted to these luscious fruits. At Clumber the cultivation of peaches and nectarines on open walls is not sufficiently successful to admit of dependence being placed upon trees out of doors for any considerable part of the supplies, hence the extent to which they are grown under glass. Trees on walls grow very well, and the early varieties ripen excellent crops, but the later varieties fail to attain maturity, especially in unfavourable seasons, such as that of 1909. Fruit trees in pots are not less successfully grown than are the peach and nectarine trees planted out under glass, and contribute liberally to the supplies. The large fig house can hardly fail to interest fruit growers, for the trees within its shelter yield an abundance of fruit from April till October, and that of the highest quality. Note was not made of the length of the structure, but it should be mentioned that the varieties are Brown Turkey, White Marseilles, and Negro Largo, all of which, as so well known, have much to recommend them. There are five or six vineries, and in a rapid run through them a grand crop of Muscat of Alexandria arrested attention, and it

THE BEAUTIFUL LINCOLN TERRACE, CLUMBER.

was interesting to learn that the vines had been inarched upon Gros Colmar. Then followed two houses, one wholly devoted to Madresfield Court, which is well grown and fully appreciated in the "Dukeries," and the other to Gros Colmar, and two occupied by Muscat of Alexandria, making three devoted to this fine grape, and one in which Black Hamburgh and Madresfield Court were growing in association. There may be others, but sufficient have been mentioned to show how extensive is the cultivation of grapes. It should, however, be added that the success achieved is in every way commensurate with the position grape culture occupies in the economy of these gardens. It may also be added that about three thousand strawberry plants are grown annually in pots for forcing.

The walls by which the kitchen garden is enclosed are well clothed with fruit trees of various kinds, and the north aspect of one of them is devoted to the loganberry, with excellent results, the crops being heavy and the fruit of excellent quality. Highly interesting also is the hedge of the parsley-leaved bramble, which is found especially useful for the supply of fruit after other soft kinds are practically over. This hedge is one hundred yards long and six feet high, and immense quantities of fruit are annually gathered.

BORDERS OF HARDY PERENNIALS, CLUMBER.

The quarters devoted to vegetables are full of interest, but it is not possible to refer to them at a length that will admit bringing into prominence the lessons that could be learnt from them, but as indicating the areas devoted to the several crops it may be mentioned that the asparagus beds have an area of fully an acre.

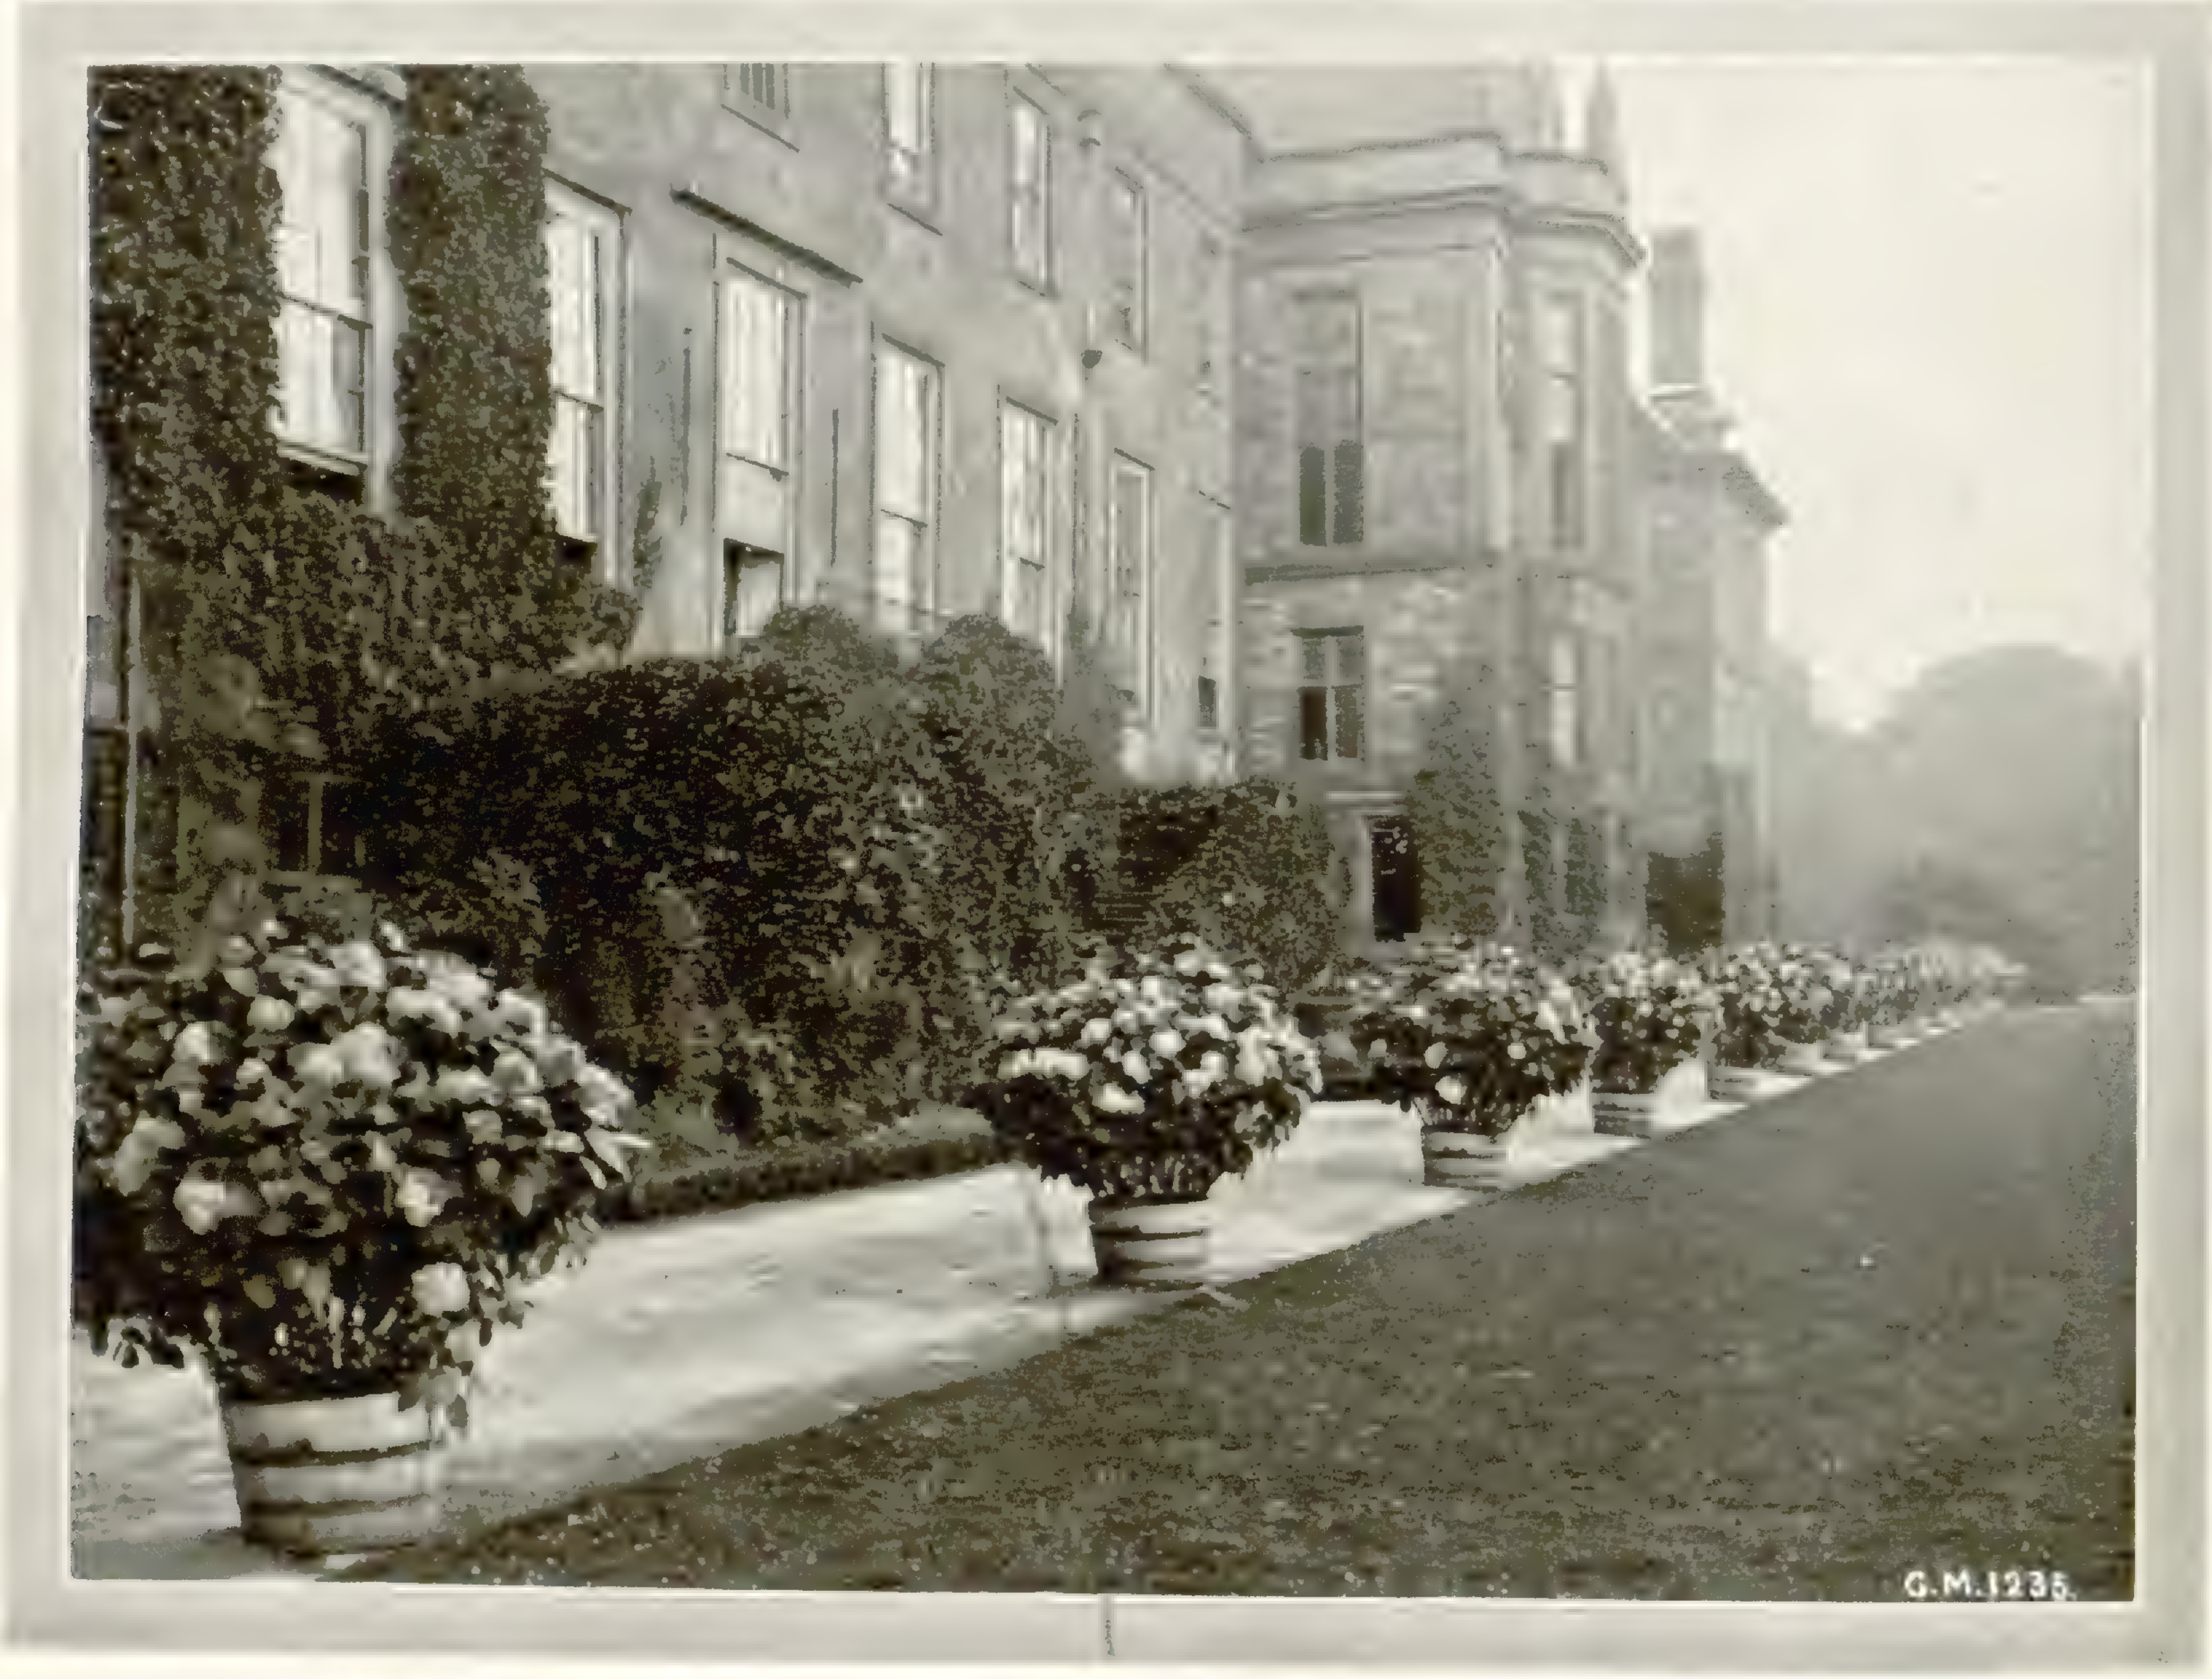
Rufford Abbey.

Leaving Clumber, with its manifold attractions, and proceeding southward by way of the main road to Newark for a distance of eight or nine miles, the handsome lodge by which access is obtained to the demesne of Rufford Abbey, the seat of Lord Savile, is reached. The distance from Worksop is some four or five miles more, but the usual way of reaching the Abbey is to travel to Edwinstowe Railway Station, which is within a distance of between one and two miles. Those, however, who are desirous of seeing as much as they can of the distinctive charms of the district, and have sufficient time on their hands, would do well to go to Worksop, and drive thence, for by doing so they would pass through some of the finest estates in the United Kingdom, enjoy for the greater part of the way scenery of unsurpassed beauty, and have an opportunity of becoming acquainted with some of the most characteristic features of Sherwood Forest. For a considerable distance the road intersects the fine estates of Welbeck, Clumber, and Thoresby, all rich in interest, and it skirts the beautiful tract of woodland known as Birkland Forest. This lies to the west of the road, not far from Edwinstowe, and is well worthy of a visit from those who appreciate the charms of the natural forest, and take an interest in trees remarkable for their noble proportions or historical associations. This portion of the forest derives its named from the remarkable development to which the birches have attained, but of the older trees few remain. Hereabouts also are many notable oaks, but, unfortunately, time did not admit of a visit being paid to them, and, therefore, nothing can be said with reference to them from recent personal knowledge. The most noteworthy of these is unquestionably the Major Oak, an ancient tree, with a trunk having a circumference of thirty feet, and the branches a spread of about eighty feet. According to tradition seven persons have dined together within the hollow trunk.

Rufford Abbey is a large and stately building, and includes part of the Cistercian monastery that was founded as far back as 1148 by Hugh Fitz-raph and his wife. With reference to this historic seat, Leland, who visited it, writes: "Rume Water is a village commonly called Ruford for Rumeford, a quarter of a mile beyond which stood a late Rumford Abbey of white monks. The Earl of Shrewsbury hath it now of the King for exchange of land of his in Ireland." The mansion occupies a commanding position in a large finely wooded and highly picturesque park, and is surrounded by pleasure grounds that are not less remarkable for their extent than for their beauty. Many and varied are the fine trees that have a place in the pleasure grounds; the shrubs are equally noteworthy, and flowers are freely used in the enhancement of their distinctive charms. Lord and Lady Savile take the keenest interest in their delightful home and its surroundings, and within recent years flower gardening has been so greatly developed that at no distant date Rufford Abbey will, it may be safely assumed, become not less famous for its flower gardens than for its other attractions. Within the past two years a new flower garden, with an area of many acres, has been formed in accordance with the wishes of Lady Savile, who possesses a strong love for hardy and other flowers; and as the design is bold, and the site beyond the influence of trees with wide-spreading roots or branches, this will at no distant date become a glorious feature. In the centre of the garden is a large circular lily pool, with handsome stone margin, and radiating from it are a few broad walks that give ready access to the several parts of the garden, and admit of the beauty of the flowers being enjoyed at times when it would not be prudent to walk upon the grass. The intervening spaces are turf, and form an excellent setting for the flower beds, which are large in size and varied in shape. This garden, it was understood, will be chiefly devoted to hardy flowers, but as the preparation of a stock of plants that must be numbered by thousands, and include the finest of the kinds, is work requiring some time, annuals were rather freely used last summer, the garden having been finished in the spring, and the effect was equally remarkable for its brightness and beauty. Hence the garden was of interest for the valuable object-lesson it gave in the use of the most attractive of the annual flowers, as well as for the promise of being quite unique among gardens of its class, when the subjects with which it is to be permanently occupied have become established.

Contiguous to this magnificent flower garden is a large lake that has been recently formed, in which water lilies and various other acquatics and semi-acquatics are already established. On the surface of the water float a selection of nymphaeas, comprising the finest of the hybrids and varieties at present in cultivation, and the margin of the water is fringed with large numbers of the more or less erect-growing plants that thrive in shallow water, or in positions on the margin where the roots can find their way into the water, or run freely in soil through which water can percolate without let or hindrance. The pathway that runs along one side of the lake is somewhat of an innovation, and has much to recommend it, for by providing a footway that is quite firm and dry at all times it adds greatly to the enjoyment that a well-furnished water garden is so well able to afford. The illustration of the path that is given herewith tells its own tale so admirably that the briefest reference will suffice. The "dry" wall by which the high ground on the right-hand side is supported is utilised in the cultivation of aubrietias and other alpine plants that thrive in such positions, and at the foot of the wall is a row of a nepeta, which presents a light appearance, and is so soft in colouring as to be in full harmony with the surroundings.

Some distance from the new garden is a long border of considerable breadth, in which a comprehensive collection of hardy perennials have had their home for many years, and highly attractive is it throughout the summer season. It agrees with the finest herbaceous borders that usually come under notice in the care evinced in selection, and the robust state of the plants, but it differs from most in not having a background of any kind, and the effect, as shown in the accompanying illustration, is distinctly pleasing. Not far distant from the kitchen garden are several flower gardens that contain much to interest the visitor, and to be a perennial source of pleasure to the noble owners. In one we find an admirable representation of a Japanese garden, on the site of a portion of an old orchard. In another enclosure, with an avenue of fruit trees all round, is a Roman garden, that is at once interesting and attractive. In an adjoining enclosure, which has for its boundary a closely-cut yew hedge, is a rose garden, in which dwarf and climbing roses are equally at home. The former occupy beds in the centre of the area, and the latter fling their supple flower-laden growths in graceful profusion over the light rustic pergola that is carried right round the garden. There is no occasion to give the names of varieties, but, as will be readily understood by those acquainted with garden roses, Caroline Testout, Liberty, Killarney, and Prince de Bulgarie were prominent among the dwarf varieties, and that Dorothy Perkins, Lady Gay, and Crimson Rambler contribute their full share to the rich display of colour that is annually produced by the varieties that trail over the pergola. Note was made of several other delightful features, and one that appealed strongly for attention was the border of blue flowers, in which blue clematises, Michaelmas daisies, purple dahlias, heliotropiums, and violas were employed with quite exceptional taste.



GARDEN FRONT OF RUFFORD ABBEY WITH SPECIMEN HYDRANGEAS.

The cultivation of specimen hydrangeas constitute a strong feature at Rufford Abbey, and the illustration of the fine examples that are used in the embellishment of the garden front of the mansion during the summer months will afford an excellent idea of the results obtained. It is not necessary to give measurements, but it should be said that several of the specimens were carrying upwards of one hundred finely-developed flower heads each.

The spacious kitchen garden, with its splendidly furnished walls, its bush and pyramidal apple and pear trees, its great breadths of vegetables, and sweet peas and other flowers for the supply of cut bloom is not less interesting in its way, for on every side the impress of cultural skill is evident. Whatever may be the evidence of cultural skill and orderly arrangement in the kitchen and flower gardens, it is not greater than that found in the large number of fruit and plant houses that have their place in the kitchen garden. Within these structures, it might be said, Mr. J. Doe, who has for many years had charge of the gardens, is "seen at his best." That, however, would be hardly correct, seeing that all departments evince the most skilful management: but it will be quite correct to say that Mr. Doe is a fruit grower of the highest eminence. More especially is he successful in the cultivation of grapes, peaches, and nectarines, and many are the honours that have been obtained with these fruits at the leading exhibitions. After having seen and admired at the exhibitions collections from the Rufford Abbey gardens, comprising peaches and nectarines of the largest size and rich in colour, and huge clusters of Muscat Hamburgh, Muscat of Alexandria, Madresfield Court, and other choice grapes, it was interesting to find that the success achieved is not in any way due to light cropping

As a matter of fact, Mr. Doe takes heavy crops, and these are obtained from year to year without unduly taxing the trees or vines. The number of vineries is considerable, and in the first that was entered was a crop of Black Hamburgh of which it would be difficult to speak too highly; the vines were carrying a heavy weight of fruit, and the bunches were of large size and the berries splendidly coloured. Even more noteworthy perhaps was the crop of Madresfield Court in another house, for the average weight of the bunches was 6lb., and the berries were of the largest size and perfect in development. Of quite exceptional excellence also were the crops of Muscat of Alexandria and Muscat Hamburgh, both of which are regarded as good tests of the gardener's skill as a grape grower. Size and shape of bunch left nothing to be desired, while the colour, an important point with these two grapes, was perfect. The peach houses are not less remarkable in their way, for the trees are in the best of condition; the crops are invariably heavy, and the fruits of full size and resplendent in colour, and prominent among the several peaches was that fine variety Sea Eagle.

TASTEFULLY ARRANGED BORDER OF HARDY FLOWERS, RUFFORD ABBEY.

Carnations are evidently not less highly appreciated at Rufford Abbey than elsewhere, for two large structures are wholly devoted to them, and these, as the numerous other houses devoted to ornamental plants, well deserve a somewhat full notice, which, unfortunately, it is not now possible to give.

Thoresby Hall.

Immediately to the south of the Clumber estates are those of Thoresby Hall, the seat of Earl Manvers, and, as will be readily understood, many of the points of interest and attributes of beauty characteristic of one are common to the other. Therefore, the visitor to Thoresby Hall will find much to afford interest and pleasure. The grandly timbered park has an immense area, as indicated by the fact that it has a circuit of ten miles. Especially remarkable is the park for its arborescent features, the fine grove of old oaks being particularly noteworthy, and of great beauty is the fine sheet of water formed by the Meden. Occupying a commanding position in the park is the palatial mansion, which is one of the finest examples of the Elizabethan style of architecture that could possibly be found. The old mansion, in which, by the way, Lady Mary Wortley Montagu was born, was destroyed by fire in 1745, and this was replaced by a building commenced in the same year. Subsequently it was rebuilt by Earl Manvers from designs by the famous architect Salvin The beautiful grounds, with their fine trees and shrubs, form an admirable setting to the noble edifice, and it is interesting to note that a rather bold style of decoration has been adopted in the immediate neighbourhood thereof. Instead of beds filled with plants remarkable for the beauty of their flowers or foliage, in accordance with the style so general, large masses of shrubs have been planted, and cut into shapes more or less formal. The golden yew is included among the subjects used, and the closely-cut masses take on an exceedingly rich colour, and are singularly effective.

Time did not admit of other than a rapid run through the gardens, and, possibly, some features may have been missed. It was noticed that the grounds to the west of the mansion are highly attractive, with their finely developed trees of various kinds, and in a somewhat secluded and restful spot is a rose garden of moderate dimensions, but tastefully designed, and skilfully arranged, and immensely attractive during the summer months. The beds are geometrically arranged on the gravel, and occupied by dwarf plants of the best of the varieties for the garden. Iron pillars are provided round the boundary and in other parts, and connected with chains, over which climbing roses in variety are trained. By this means festoons of flowers of the most delightful character are obtained, and these of themselves produce a charming display of colour. In the centre of the garden is a sun-dial, which may be mentioned for the purpose of indicating how useful an accessory of this kind is when simple and elegant in design for placing in a prominent position devoted to roses. Not far distant from the rose garden is a specimen of the Weeping Wych Elm (Ulmus montana pendula), which, instead of being borne aloft on a tall stem, in accordance with the practice that usually obtains, has a quite short one, and the general effect produced by the elegant branches suggests a cool retreat from the noonday sun. Occupying a secluded position, the tree, with its ample rich green leafage, presents a pleasing appearance, and at once attracts attention by reason of its novelty.

The well-planned kitchen garden has a large area, and by the judicious use of hardy flowers it is made beautiful, as well as of a high degree of utility. Briefly stated, the large area is divided into four portions by means of broad walks that intersect each other in the middle of the garden. The walk that intersects the garden from north to south is flanked by borders of considerable breadth that are devoted to hardy perennials. The walk running from east to west has a row of bush fruit trees on either side, and it was of interest to note that these are set well back, and do not, as is sometimes the case, extend over the pathway

On the northern boundary of this garden is a fine range of lean-to houses chiefly devoted to fruit, and divided in the centre by a bold span-roof structure, which forms an admirable relief to the uniformity of the other houses, and adds considerably to the general effect. Especially noteworthy for their large size and for the splendid crops they annually produce are two fine fig trees that occupy one of the structures devoted to these luscious fruits. At either end are span-roof houses of moderate dimensions that are placed at right angles to the houses forming the range, and devoted to plants of various kinds. Carnations are strongly represented, and in the structures wholly devoted to them the health of the plants and the abundance and high quality of the flowers prove to demonstration that Mr Simmons is a past master in their cultivation, as in the case of other classes of plants. In front of the glass structures there is a breadth of turf, with beds of roses. On the opposite, or south, side of the broad walk that extends the whole length of the range of glass is a broad border, some hundreds of yards in length, that is separated from the vegetable quarters by a closely-cut hedge, and filled with hardy perennials in great variety and in the best possible condition.

Near the principal entrance, and on the outer side of the wall is a garden reserved for the younger members of the family, and it would appear from its condition that they fully appreciate the opportunities they have for indulging their taste for gardening. The boundary on one side is formed by a rustic trellis, over which the charming Dorothy Perkins spreads with its customary vigour, and annually produces a wealth of flowers.

The principal range, as may be assumed, is chiefly devoted to grapes, peaches, and nectarines, and in the cultivation of these Mr Simmons is not less successful than in the production of outdoor fruits and vegetables.

George Gordon.

PAVED WALK AND WALL WITH ALPINE PLANTS BY THE LAKE SIDE, RUFFORD ABBEY.

POTTING COMPOST FOR PERPETUAL CARNATIONS.

As the result of considerable experience I am a great believer in a plain simple compost. It is certainly not the most elaborate recipe that makes the best and most sustaining dish for the table, nor is it the most elaborate mixture of soils which produces the best perpetual carnations. There is no excuse for using a little of everything just because you happen to have it handy. A good cook knows his dishes, and a good gardener should know his plants, and it is never wise to add anything to the potting compost unless there is a good reason for so doing, and it is a necessity for the plant. Nature believes in simple foods, and as yet there is no better guide.

Loam we dealt with quite recently, and there is little, if any, difference of opinion on this matter. That of a semi-sandy texture is best for carnations.

Leaf-mould is one of those materials which has its place, but it should not be in carnation compost. I know full well many will disagree with me, but in this matter I can speak with authority, having a knowledge of what the best carnation growers in England and America think regarding it. We all know the effect leaf-mould has upon the soil and growth of plants, and we also know that anything which has a tendency to create fungus is opposed to carnations, whilst the soil must be sweet at all times, to encourage and assist a healthy root action; the best friend of leaf-mould will not claim that it does this.

Farmyard manures are required and horse manure is generally preferred for the heavier class of soils, whilst cow manure is strongly to be recommended for those of a lighter texture. I am not in a position to speak of other farmyard manures, but several of them are very strong, and should be used with caution. It is a mistake to have the average farmyard manure too much decayed for carnations. A medium state is best.

Wood ashes can be added to almost all soils with benefit to the carnation, which is a lover of potash. The ashes from burnt garden rubbish are also good, provided the rubbish is burnt systematically, and the ashes taken care of to prevent their becoming wet.

Mortar rubble, lime, and chalk are other essentials to the average carnation compost. Personally, I much prefer mortar rubble, particularly if it is from buildings erected in the days when people did build, and used lime with which to make the mortar used when the clerk of the works was not present, as well as when it was prepared under his eye.

The best sand for potting compost is that of a coarse, sharp grade.

Such parts as charcoal, oyster shell, etc., may be treated as expensive luxuries, and their presence will not be required in the soil by a good grower.

The old practice of mixing artificial manures with the potting compost is rapidly dying out. These are best given as the plant requires them, if, indeed, a carnation ever does require any artificial fertiliser. Yet, in the case of a poor soil, it can be enriched with a little bonemeal or a purely organic manure, some of which are specially mixed for carnations.

All will realise the impossibility of giving any hard and fast rule for the correct potting compost for perpetual carnations owing to the varying degrees of loam met with, yet the following suggestion will be found of considerable service. As previously stated, it is impossible to lay down definite rules for the final potting compost, and one can only made a suggestion to the following effect: To the body of loam add about one-fifth part of farmyard manure, and other materials in accordance with the texture and organic power of the whole.

MONTAGU C. ALLWOOD.

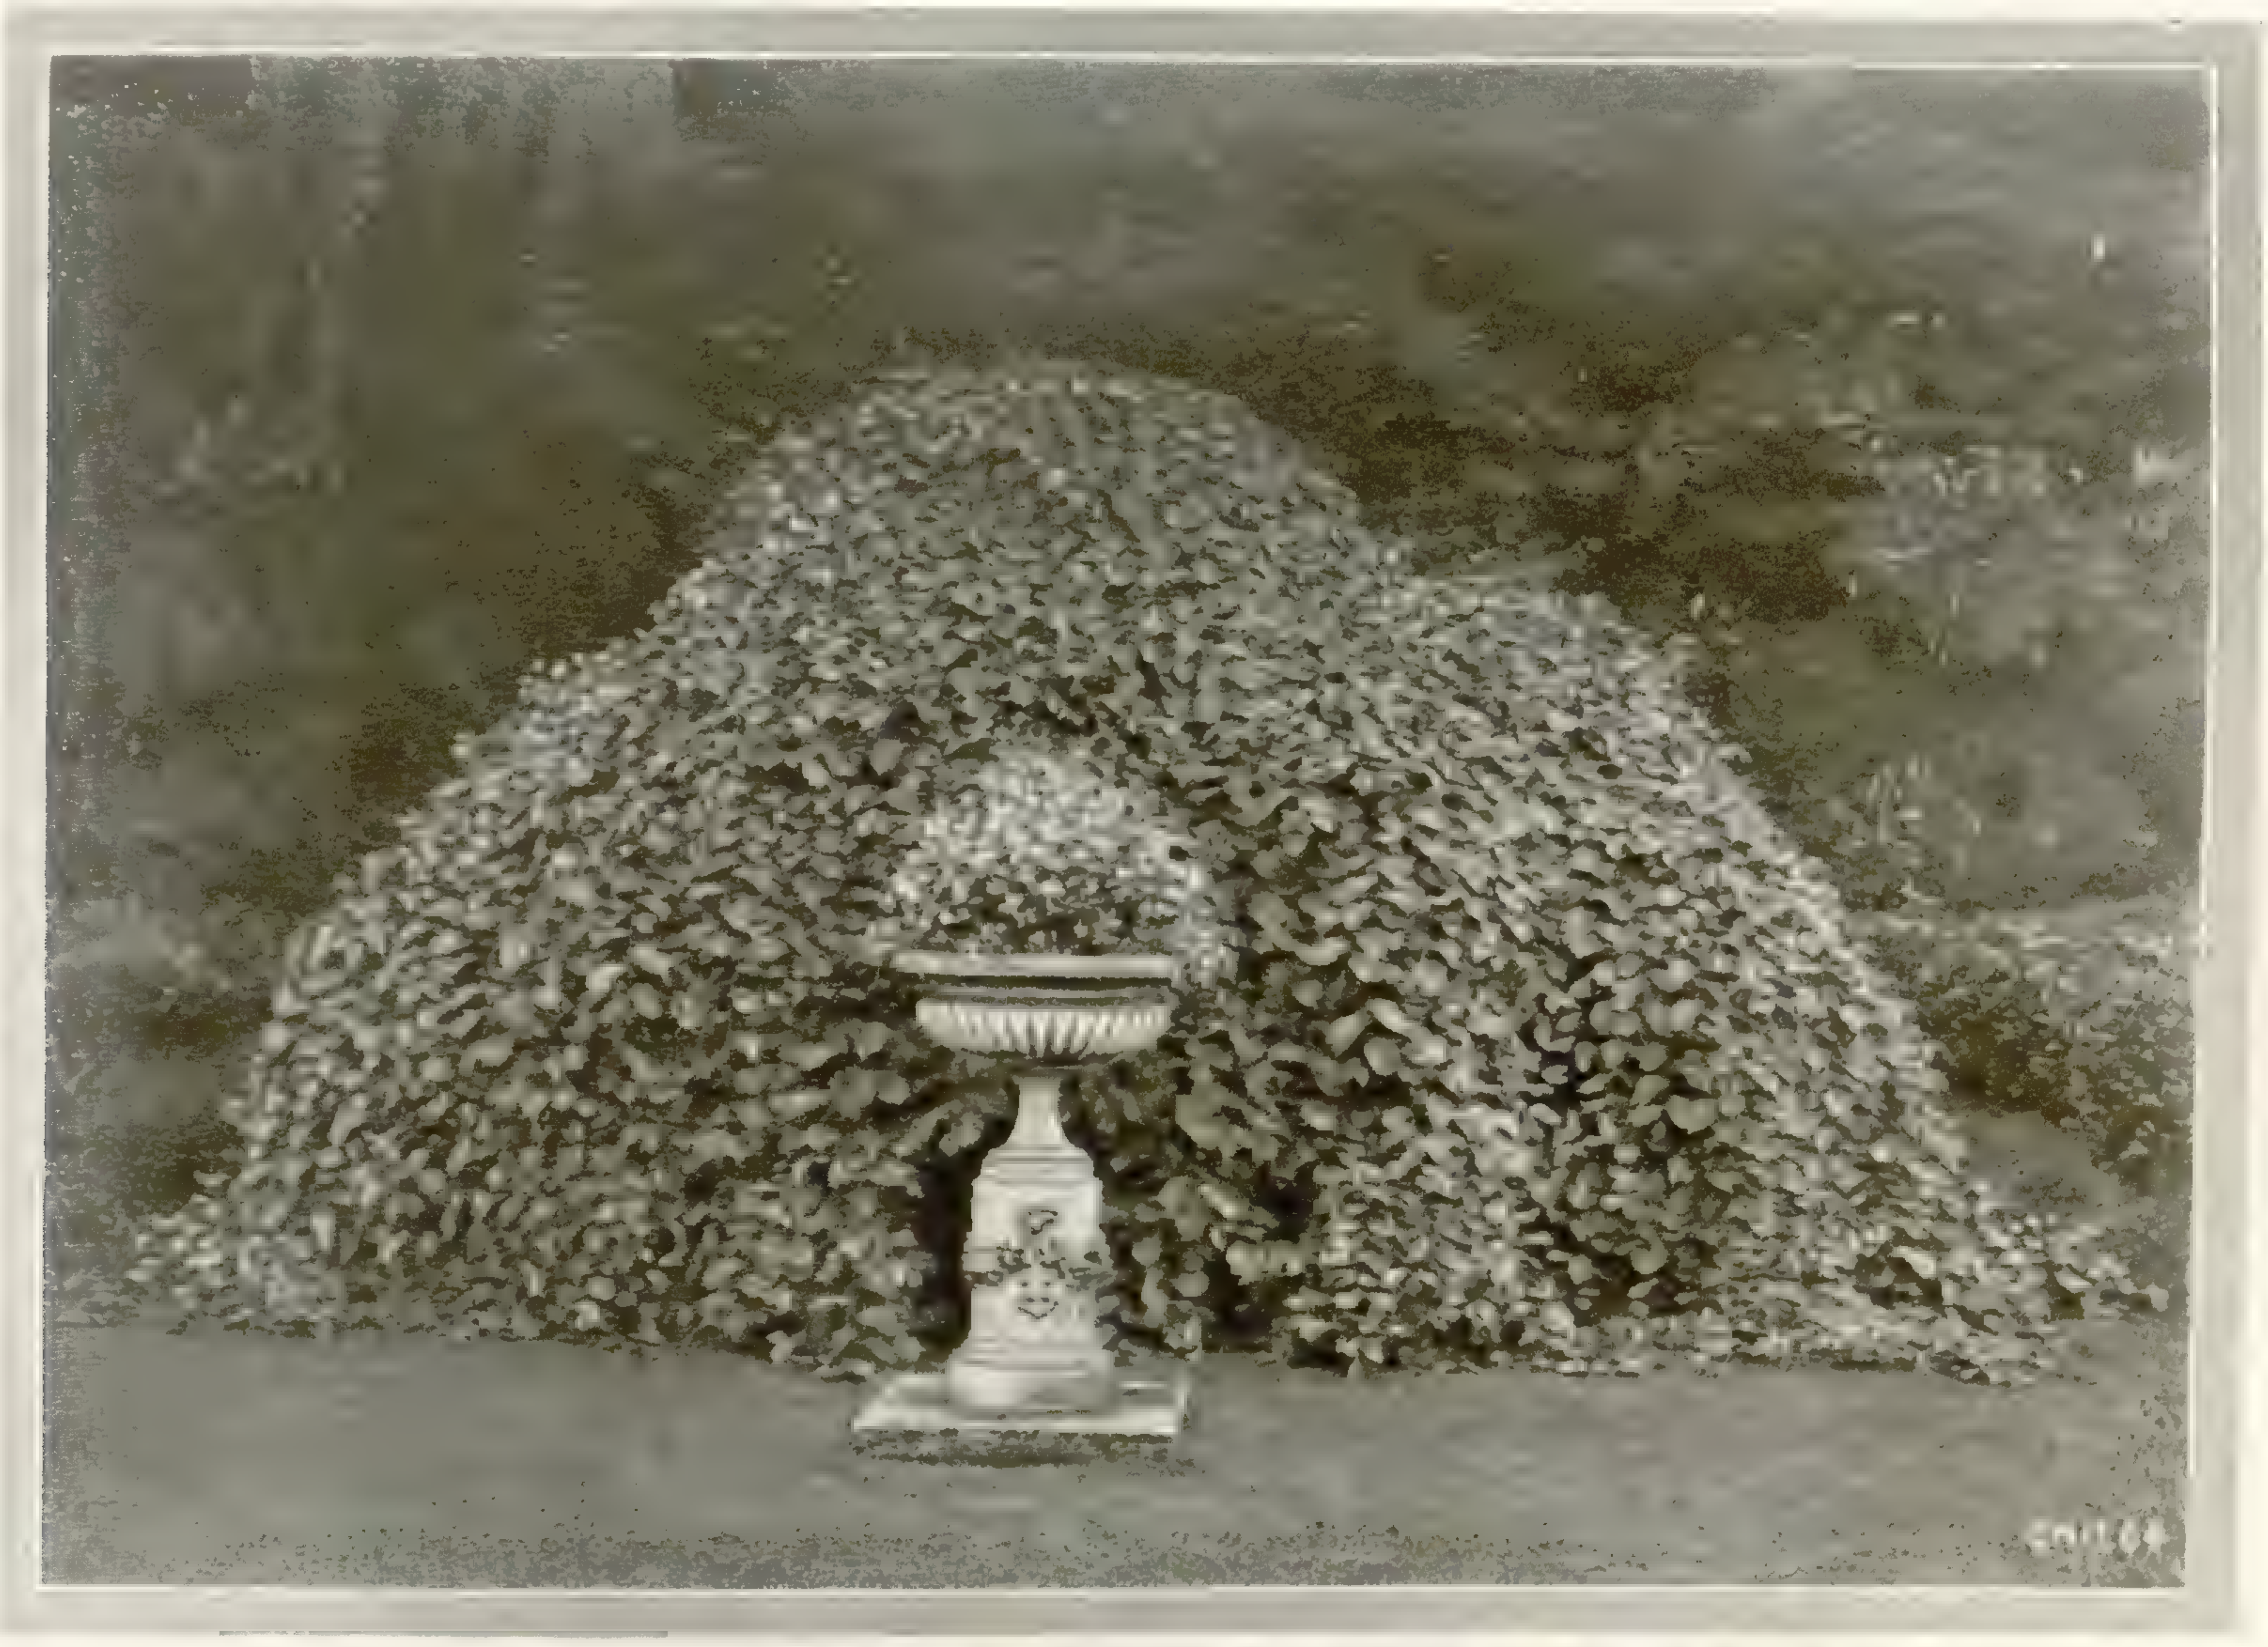
Bush Hill Park.

ERYTHRINA CRISTA GALLI.

This is commonly called the coral tree. The smooth leaves are divided into three, each leaflet being about the size of a bay tree leaf. The flowers are crimson in colour on the inside, with a shading of old gold on the outside; they are hook-shaped, and borne in clusters on the main stem, about halfway up it. Old plants may be cut back, and when new shoots will grow, sometimes half a dozen may be obtained from the same stem. A portion of the latter may be cut up into lengths averaging one inch each, and the pieces inserted in sandy soil in a pot or pan, and placed in a propagating frame. If treated similarly to pieces of dracæna stems young plants can be readily obtained. The young shoots may be rooted as cuttings, when they will soon strike, especially if subjected to a mild bottom heat.

Loam two parts, peat one part, dried cow manure one part, and some coarse sand, makes a good compost. The plants may be grown in the open air during the summer time, but greenhouse treatment throughout is best for them. The uncommon richness of the colour of the flowers is very attractive. GEO. GARNER.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in THE AMATEUR'S GREENHOUSE, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.



DWARF SPECIMEN OF THE WEEPING WYCH ELM AT THORESBY HALL.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEEDLING ODONTOGLOSSUMS.—The raising of odontoglossums from seeds is now so extensively practised that a note concerning them occasionally is necessary. Seedlings that were raised during the closing months of last year, or the early months of this year, should, if they have made normal advancement, require attention and probably removal from the seed beds. The safest period at which to remove young seedlings is immediately they have completed their first leaf, as it is at this stage the first roots appear, and if the young plants can be dealt with at this period they usually push the new roots into the fresh compost quickly, and there is then little danger of the plants suffering any check. Where there are only a few seedlings I would advise that they should be pricked out separately into small thumb pots. Plants can have better individual attention when planted separately than is possible where several are grown together in the same pot. Of course, where there are large numbers of plants to be treated, it is almost impossible to deal with them in any other way than by placing them in store pots. These pots should be clean, and drained to about two-thirds their depth with clean crocks or chopped bracken roots.

THE COMPOST we find most suitable consists of chopped peat, broken leaves, and sphagnum moss in about equal proportions, with sufficient sand added to render the compost porous. It is a good plan to fill the pots first, making the potting compost moderately firm, and watering it, taking care to wet it through. Then let the superabundant moisture drain off by allowing the pots to stand aside for a time before the seedlings are pricked into the compost. It is not always convenient to allow the seedlings to remain on the seed beds until the first leaf has developed, and in such cases they should be removed almost as soon as they commence to show the first leaf. The seed beds often become unsuitable for the young seedlings when about this stage, for it must be remembered that from the sowing of seed right up to the rooting stage the surface of the seed bed has to be kept in a moist condition. This naturally encourages the growth of lichen and mosses, or it may be the sphagnum moss will overgrow the seedlings, with the result that if these are not transferred there is grave danger of their being smothered. A great deal may be done to check this overgrowth of the surface in the early stages, but there is soon a possible risk of disturbing the young seedlings, and I consider if they are once disturbed it is just as well that they should then be transferred to the pots.

VENTILATION. — With a freer use of the ventilators, and more drying conditions outside, care must be taken that the seed beds, especially where there are seedlings in the early stages of development, should not become dry. Given strong light and a dry seed bed, and odontoglossum seedlings will perish. It is a good plan to spray the plants and seed beds overhead once or twice a day in bright weather. The pots on which seeds are sown should also be occasionally dipped, but in doing this care must be observed not to disturb the seeds.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

STEPHANOTIS.—Now that this is going out of flower some of the weaker shoots may be cut out, and if there is not a great deal of room for extension it would be wise to cut back a good many of the shoots that have carried flower, to allow for the extension of stronger-growing shoots that are likely to flower later on in the season. Opportunity should also be taken to give the plants a thorough good cleansing if they require it, and this is easily done if the shoots have been trained to strings suspended from the permanent wires.

CLERODENDRON BALFOURIANUM is another plant which blooms fairly early in the season, and when permanently established in the stove it will, in most instances, be over by now. Cut out all old wood that can be spared, and train out the young growths, giving sufficient room between each to ensure the wood becoming well ripened; a plentiful crop of bloom will then result another season.

EXHIBITING.—In many establishments where some exhibiting is done the present will be a very busy and anxious time, particularly where stove flowering plants are to be exhibited during July. Some will need hurrying, whilst others may need retarding somewhat, so as to have as many plants in good condition as possible when the time arrives for them to be staged. Such plants as stephanotis, clerodendrons, bignonias, allamandas, bougainvilleas, etc., must all be very carefully trained so as to have the balloon trellis, or whatever shape they are to be trained to, nicely and evenly covered with flowering shoots; it is not wise to defer this training too long, or the foliage and flowers will not have time to settle themselves into position. Amongst climbing foliage plants Asparagus, Cissus discolor, and varieties of vitis will also need attention in respect to training.

CALADIUMS.—When these have to be exhibited it is also wise to get them staked out some time beforehand, using very fine hazel or green-painted stakes for the purpose; commence by tying out some of the dwarfer leaves round the sides of the pot, allowing the taller leaves to overlap each other a little as they are worked back towards the centre, but be very careful not to pierce the corms with the stakes, or they will be spoiled. A few other plants that may want staking are achimenes, allocasias, anthuriums, bushy crotons, Dracæana Sanderiana, phyllanthus, etc., etc. Wherever possible all the above plants should be gradually hardened off a little previous to being exhibited, as the draughts in an exhibition tent very often make the more tender kinds flag, and, apart from the injurious effect this has on the plants, it may often mean the loss of valuable points in a competition.

GARDENIAS.—Both old and young plants of this very fragrant flower will now be making growth freely. In the case of old plants that may be growing in pits it might be advantageous to cut them back a little if they have gone out of bloom, though, if there is plenty of head room this may not be necessary. In any case, they ought to be thoroughly cleansed, and top-dressed with some good peat and loam; this will help them to make free growth during the summer months. Old plants in pots may be repotted, just pruning them into shape a little afterwards, and keeping them well syringed, when they will break freely. The younger plants that were rooted in the spring should be potted on as they require it, or if it is necesary to replant in pit or bed the present is a good time to do it, and if the sun heat is made good use of, and the leading shoots pinched once or twice, it is astonishing the amount of growth they will make before the autumn.

FIRE HEAT.—From now onwards, for a month or two, dispense as much as possible with fire heat, although if the weather should set in cold and dull do not leave it off too long, or such plants as crotons will soon begin to lose colour.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

LAYERING STRAWBERRY RUNNERS.—It is necessary in order to secure the best results in forcing strawberries to layer the runners as soon as they commence to root, and preparations should now be made for the purpose. The required number of clean 2½ inch or 3-inch pots should be made ready, together with the necessary quantity of loam, which, if too heavy, should be made sufficiently porous by the addition of pulverised manure from a mushroom bed. When preparing the pots place a piece of turf in the bottom of each, and fill them firmly with the compost. Plunge the pots near together in the mulching material, in open positions, or if mulching material is not used, half plunge the pots in the soil between the rows. This will both accelerate root action and lessen labour in watering. Remove the portion beyond the first plantlet on each runner, and secure a youngster with a peg to the centre of the soil in each pot. Subsequently prevent the plants suffering from want of water, damp them overhead in the evening of bright days, and remove surplus runners as they appear. As soon as the plants are sufficiently well rooted, sever them from their parents, and place them upon a bed of ashes in a semi-shaded position in readiness for being shifted into their fruiting pots. For forcing in a general way there is no other variety so valuable as Royal Sovereign, and except to test new ones we use no other. We intend giving the variety George Monro a trial this year, as we have it showing heavy crops of early fruit in open quarters.

EARLY MUSCAT VINES.—Where the fruit is commencing to colour the borders should have needful attention with respect to watering and remulching, so that after the fruit is ripe the atmosphere of the house will not have to be unnecessarily moistened. If the laterals have been afforded ample space, and their sub-growths closely stopped, the colouring process will be satisfactory, provided the leaves are healthy, and are kept clean and free from injurious insects, and a sufficiently warm and buoyant atmosphere is maintained by careful attention to ventilators and heating apparatus; but the consideration to these matters is greatly controlled by the state of the weather, and it is only by close observation and application that one becomes expert in these particulars. It may be said, however, that, as a rule, this grape, while ripening, is not given enough fresh air to enable it to properly colour, therefore, whenever conditions are favourable there should be no hesitation about liberally ventilating the houses.

EARLY FIGS.—As soon as early forced trees in pots are cleared of their fruit they should be gradually inured to free ventilation, both by day and night, and be thus prepared for being plunged outdoors next month in a bed of ashes, placed in a sheltered sunny position. Keep them supplied with water and needful manures, and keep red spider in check by the aid of the syringe. If scale is present on the wood or leaves remove it by the use of a soft soap solution. In the case of trees planted in borders, after their first crop of fruit is gathered, well thin the second crop by removing the fruit nearest the points of the shoots, and keep the fruit selected for the crop well exposed to the sun. Ventilate the house early on bright days, and close it soon enough for the temperature to rise up to 85 or 90 degrees. Promote a moist atmosphere by damping the floors, etc., daily, thoroughly syringe the trees, and give careful attention to watering, applying manures if necessary, and top-dressing the borders with short stable manure.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

CUCUMBERS.—Plants that have been in bearing from an early period will show signs of exhaustion, unless they are regularly top-dressed with a light compost consisting of turfy loam, well-sweetened horse manure, and flaky leaf-soil in equal proportions, and given waterings of tepid liquid manure every week. Regularly tie, top, and train the shoots evenly and thinly over the trellis, and cut the cucumbers as soon as large enough for use, so as to throw all the energy into the plant for the future crop. Syringe morning and early afternoon, and frequently damp the paths and beds during the day.

CUCUMBERS IN FRAMES should be growing freely after the favourable weather we are experiencing. If the temperature keeps up well very little more fermenting material will be required around the sides of the frames after this date. Close and syringe early, duly stopping and pegging the growths out evenly and thinly. Sow more seeds for a supply from August onwards.

TOMATOES.—Make a sowing now for the early winter supply, in pots, using a gritty compost. Raise the seedlings in slight heat, and pot them into small 60-sized pots as soon as possible. From now onwards grow them in a cool, light, airy house or frame, aiming at a strong and sturdy growth; pot on later into six-inch pots, and finally into eight-inch pots, which will be found plenty large enough for this batch. By the time the plants are established in these they should be placed in a deep cold frame or pit, where the lights can be drawn off on all favourable occasions. Treated thus until September it will be found that four or five trusses of fruit are nicely set, at which time the batch must be placed under glass and grown in a medium temperature.

POTATOES are looking remarkably well this season, and in most localities should be advanced enough for the final earthing up to be completed. Proceed first with a thorough flat hoeing, well breaking up the soil previous to the moulding, and, if necessary, give a dressing of soot, lime, or even burnt garden refuse around each plant at the base, as slugs may be found harbouring around the stems. The earthing up should follow, if possible, after rain, when the soil is moist, though the foliage should be dry. If special tubers are required thin the shoots to two or three of the strongest; accomplish this by placing the feet close to the plant and drawing the weak growths and suckers away with the hands.

MARROWS.—These are now fruiting very freely in frames, and to maintain regular supplies top-dress, ventilate, and syringe regularly, cut the fruits as ready, and frequently pinch the points of the shoots. Attend to those growing outside; the protecting material should now be dispensed with altogether.

PARSLEY.—This is an excellent time to sow the main batch of winter parsley; two sowings can be made, one for the open bed and one in a plot facing west, where eventually a frame can be placed over it. Even a skeleton frame, with a simple covering of mats, will ensure a steady supply for the winter. For the open bed sow in drills fifteen inches apart, scattering along the drills, previous to sowing, a quantity of burnt garden refuse, especially if the soil is of a heavy nature.

WINTER GREENS, which will include broccoli, kales, savoys, etc., should be planted out as soon as available spaces are found. In all cases plant firmly, give a good watering, and afford as much room as possible for each plant.—G. Ellwood, Swanmore Park Gardens.

Queen Wasps.—In no previous year have I seen so many queen wasps about as I have this. During the recent spell of very hot weather the wasps were flying about from very early morning until late in the evening. I dare say many readers of the Gardeners' Magazine have also seen more queens than usual. If so, fruit growers must make every reasonable effort to protect their crops later on. I remember one year (about twelve years ago) when it was quite dangerous to go near the walls where peaches and nectarines and plums were growing, on account of the swarms of wasps, for they came literally in swarms and ate through nets and muslin bags, which enclosed ripening figs and other choice fruits. The ventilators of vineries were securely netted, but the nets were removed as soon as possible after the earliest grapes had been cut. In one Black Hamburgh house a damaged bunch or two were left on the vines for a few hours, and some wasp-killing fluid smeared on the berries. In a very short time the wasps clung to these bunches in such numbers as to resemble a small swarm of bees. Whether it was owing to the great numbers that ate the poison and so did not get a sufficient dose, or whether the poison was not deadly enough, the wasps—those not killed by the men—were able to fly away after falling to the floor. But in the spring few queens were seen.—Geo. Garner.

LAWNS.—Those who desire to make a new lawn or bowling green, or to renovate and maintain existing ones in good condition, can have no better guide than "Lawns and Greens," by T. W. Sanders, price 1s. net, by post 1s. 2d.; bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

GRAND YORKSHIRE GALA AND FLORAL FETE.

(Concluded from page 466).

£10 premier award was won by Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, who secured 114½ points. His best dishes were Muscat of Alexandria and Black Hamburgh grapes, Hales' Early peaches, Lord Napier and Early Rivers nectarines, Kirk's plums, Lady Sudeley apples, Royal Sovereign strawberries, cherries, melons, and Brown Turkey figs; second prize fell to Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, who secured 110 points, and had odontoglossum spikes and pink carnations in his decorations; Mr. Searle, gardener to the Duke of Northampton, Castle Ashby, third, with 97½ points; and Messrs. C. Simpson, Lim., Spurriergate, York, fourth, with 87 points.

Premier place for ten dishes of fruits was also won by Mr. J. H. Goodacre, who led with Muscat of Alexandria and Black Hamburgh grapes, Early Rivers peaches, and Early Rivers nectarine, Royal Sovereign strawberries, Early Green Gage plums, cherries, figs, and apples; Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, second; and Mr. C. McPherson, gardener to Baron de Forest, Londesborough Park, Market Weighton, third.

The best six dishes of fruit came from Mr. J. Hathaway, gardener to J. Brennan, Esq., Baldersby Park, Thirsk, who had finely coloured Early Rivers nectarines, etc.; Mr. Doe, gardener to Lord Saville, Rufford Abbey, Ollerton, second; and Mr. Goodacre third. Mr. J. Leadbetter, gardener to Mrs. A. Wilson, Tranby Croft, Hull, scored for four dishes of dessert fruits, and was followed in order by Mr. J. Hathaway and Mr. Goodacre.

Mr. Hathaway had the best dish of six peaches, a fine set of Royal George; twelve cherries. Mr. Doe scored for nectarines with Early Rivers. Mr. T. Bray, gardener to Lady Hawke, Weyhill Park, Tadcaster, had the best pair of bunches of black grapes, showing Black Hamburgh finely; Mr. Hague, gardener to W. C. Cliff, Esq., Meanwood Towers, Leeds, came first for white grapes with Buckland Sweetwater. For strawberries Mr. G. T. Brotherston, Breckenbrough Hall, scored for strawberries, and Messrs. Rivers and Son, Sawbridgeworth, led for cherries with Early Rivers.

Mr. Searle scored in Messrs. Webbs' class of six dishes of vegetables, his New Jewel tomatoes and New Supreme dwarf beans being particularly fine; Mr. W. N. Hague, Meanwood Towers Gardens, second, and Mr. W. Nicholls, gardener to Lady Beaumont, Carlton Towers, third. In Messrs. Suttons' class for a collection of six dishes of vegetables, Mr. J. Gibson, Welbeck Gardens, was a capital first with fine examples of Early Giant peas, Princess of Wales tomatoes, Ideal potatoes, Sutton's Favourite carrots, Magnum Bonum cauliflowers, and Princess of Wales climbing French beans; Mr. Searle second; Mr. Nicholls third.

NON-COMPETITIVE.

The non-competitive displays at York are now very fine and probably provide from one-third to one-half of the total display. On the whole, they are all well arranged, and the quality of the exhibits is very high throughout.

A very beautiful collection of pæonies was the chief feature of a splendid display of hardy flowers made by Messrs. R. H. Bath, Lim., Wisbech; Jean d'Arc, Festiva Maxima, Mdme. Jules Elie, Triomphe de l'Exposition, and Insignis were particularly good. Pyrethrums and perpetual carnations were also well shown. Messrs. Kelway and Son, Langport, Somerset, successfully demonstrated their contention that "the pæony is the fashionable flower," by putting up a glorious lot of single and double varieties in a great variety of colours, and in fine condition. Stanley, Utopia, Pink Domino, Maurice Low, Queen Alexandra, E. T. Cook, Alton Locke, and Kitty Wardell were a few of the most striking single varieties. The pyrethrums were lovely, especially the brilliant crimson and crimson-scarlet single varieties raised by the Langport firm, while sweet peas made a further addition to the display. Sweet peas were largely and finely shown by Miss Hemus, Upton-on-Severn, whose contribution was greatly admired; among her finest things were Zephyr, Paradise Apple Blossom, Zero, Guy Hemus, Evelyn Hemus, Zarina, Maroon Paradise, Paradise Ivory, the brilliant Orange Paradise, and Cerise Paradise.

A boldly-arranged group of Malmaison and perpetual-flowering carnations, rambling roses, and foliage plants came from Messrs. Wm. Cutbush and Son, Highgate, N. The popular varieties of carnations were represented by large, well-grown flowers, and a bloom of Queen Mary was conspicuous by reason of its rich mahogany crimson colour and fine form. Messrs. Jas. Backhouse and Son, Lim., York, exhibited floral designs of quite original character. Good flowers were used with undoubted skill, but the idea of associating wax models of children with the floral emblems struck us as somewhat incongruous. At any rate, the bouquets, chaplets, and other designs in natural flowers appealed to us far more than the models. Superb pæonies, pyrethrums, irises, and a host of other seasonable border flowers were admirably arranged by Messrs. Dicksons, Lim., Chester, whose exhibits are always of great interest. In addition to large vases of bold, gay subjects, were small bunches of such things as sparaxis, heucheras, Phlox amœna, and Papaver nudicaule.

Messrs. Sutton and Sons, Reading, staged in their usual first-class style a collection of well-grown melons and vegetables, among which capital peas, tomatoes, carrots, and asparagus were prominent. Brilliant gloxinias, calceolarias, and begonias afforded pleasing variety, and an additional attraction to a very effective display. The pot-grown fruits staged by Messrs. Thomas Rivers and Son, Sawbridgeworth, were, of course, wonderful examples of cultural skill, and, as the collection embraced the leading varieties of peaches, nectarines, cherries, and a few grapes, the exhibit was one of the features of the exhibition, especially as most of the varieties of the three first-named kinds of fruits were of their own raising.

Pentstemons, phloxes, violas, and pyrethrums were, as ever, well shown by Messrs. John Forbes (Hawick), Lim. The quality of such pentstemons as John Michie, John Lamont, and Ville de Paris was fully demonstrated in the excellent spikes staged by the Northern experts, whose phloxes were also of the best. The rural table decorations, tastefully adorned with sweet peas and foliage, were exhibited by Messrs. Robt. Sydenham, Lim., Tenby Street, Birmingham. Mr. H. N. Ellison, West Bromwich, staged an exquisite lot of greenhouse ferns. Adiantum fragrantissimum, Osmunda palustris Mayi, and Microlepia speluncæ were interspersed among the several varieties of crested nephrolepis, and other choice things.

From Maidstone to York, a goodly journey, Messrs. G. Bunyard and Co., Lim., brought glorious pæonies and a variety of choice herbaceous flowers. The flowers were, in spite of their long journey, particularly clean and fresh-looking, and were of first-rate quality. A blaze of brilliant colour was provided by the Oriental poppies, arranged in the form of a sloping bank, by Messrs. Bakers, Wolverhampton. Oriental King, Royal Scarlet, and Lady Roscoe were among the richest-coloured varieties. Hybrid aquilegias and pyrethrums were also staged by this firm. Mr. C. F. Waters, Balcombe, Sussex, exhibited perpetual-flowering carnations. The rosy-cerise variety, Edith Waters, was worthy of special note, being of good form, size, and colour.

The perpetual-flowering carnations from Messrs. Young and Co., Hatherley, Cheltenham, were fine, and were staged in a light and graceful manner. The standard varieties were supplemented by some promising seedlings, and the new Golden Glory was represented by flowers of pleasing form and distinct colour. Healthy young plants of saleable size were also exhibited. Mr. Elisha Hicks, Twyford, Berks, brought rambling, Tea, and H.T. roses, which he arranged in light and pleasing fashion. Mrs. Aaron Ward, Waltham Bride, Trier, and Mdme. Melaine Soupert were well shown, and Marquise de Sinety was very beautiful. Sweet peas of good quality were nicely arranged by Mr. Charles W. Breadmore, Winchester, whose stand contained the best of new and old varieties.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, occupied a large table, on which were displayed richly-coloured gloxinias and elegant sweet peas, with a varied collection of choice vegetables in front. A number of excellent melons were also shown. That choicest of choice carnations, Carola, was shown in grand form by its raiser, Mr. C. Engelmann, Saffron Walden, Essex, who also had small vases of other good varieties. On a tiered stage, with a pair of wide arches in front, Messrs. E. W. King and Co., Coggeshall, arranged a collection of the choicest sweet peas. Mrs. Wm. King, Dazzler, Clara Curtis, and Anglian Crimson were among the most pleasing.

Messrs. E. J. Batchelor and Sons, Harrogate, put up a good group of nephrolepis and other ferns. Messrs. Gilbert and Son, Dyke, Bourne, showed the double anemone King of Scarlets, and some other attractive varieties of the flower they specialise in. The hybrid zonal pelargonium J. T. Hamilton was represented by a batch of young plants bearing good trusses of brilliant flowers. Messrs. W. H. Rogers and Son, Lim., Red Lodge Nurseries, Southampton, were the exhibitors. A bright group of a new zonal named Jacqueri, and a batch of a good golden calceolaria, Northern Triumph, were set up by Messrs. Walshaw and Son, Scarborough. Both subjects are of distinct and effective character. Messrs. Jas. Backhouse and Son, Lim., York, put up a big bank of carnations, hydrangeas, rambling roses, and liliums, representative of the best varieties of their classes. Messrs. Seagrave and Co., Sheffield, showed a great variety of violas, about seventy of the best in cultivation being included in the collection.

Messrs. Bees, Lim., Liverpool, staged hardy herbaceous flowers, including Anchusa Opal and Dropmore variety, good pyrethrums, and some good plants of the lovely Primula Bulleyana. Messrs. Jarman and Co., Chard, showed zonal pelargoniums, sweet sultans, sweet peas, and a few roses. A fine yellow carnation, Mrs. Townsend, was also staged. Roses and hardy flowers in great variety came from Messrs. W. and J. Brown, Stamford. Messrs. G. Mount and Sons, Canterbury, put up a nice stand of the new rose Lady Hillingdon, which has already been described in our pages.

Orchids were well shown by Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds. The plants arranged in a bank across the end of a tent included several choice odontoglossums, cattleyas, and miltonias, with oncidiums, cypripediums, and other good things interspersed. An extensive exhibit of violas in almost endless variety came from Messrs. Wm. Artindale and Son, Sheffield, whose flowers bespoke expert culture; the front of the stand was draped with the best of the rambling roses.

G. Yeld, Esq., M.A., Burton Lane, York, brought before the public a number of new hybrid and crossbred iris and hemerocallis of his own raising. Lord of June, Porsenna, and Sunshine were fine among the iris, and Hemerocallis Tangerine was an excellent thing of bright orange colour and dwarf habit. A small group of choice orchids was arranged by Messrs. Charlesworth and Co., Haywards Heath. Epidendrum vitellinum majus, Oncidium crispum grandiflorum, and Odontoglossum Ossulstoni were in company with several good varieties of Cattleya Mossiæ. Messrs. Sander and Sons, St. Albans, showed a group of orchids, which included some good things in cattleyas, cypripediums, stanhopeas, etc. A stand of the new marguerite Mrs. F. Sander was also on view.

Messrs. Laxton Bros., Bedford, brought some good varieties of strawberries, including Connoisseur, Profit, Rival, and Bedford Champion. Outside the tents the Messrs. Backhouse had a large and well-arranged group of evergreen and flowering shrubs. Pyramid and standard box, bay, and euonymous were grouped around clumps of rhododendrons, with pillars of ivy and specimen coniferæ appropriately used among and behind the dwarfer subjects, the whole constituting a telling display.

MEDALS AWARDED.

Gold.—Messrs. T. Rivers and Son, Sawbridgeworth, Herts, and also the prize for the premier exhibit in the show, for fruit trees in pots; Messrs. Mansell and Hatcher, Rawdon, for orchids; Messrs. W. Cutbush and Son, Highgate, for carnations, etc.; Messrs. James Backhouse and Son, Lim., York, for shrubs, etc.; Messrs. Webb and Sons, Stourbridge, for fruits, flowers, and vegetables; Messrs. Sutton and Sons, Reading, for fruits, flowers, and vegetables.

Silver Gilt.—Messrs. Clibrans, Altrincham, for flowers; Miss Hemus, Upton-on-Severn, for sweet peas; and Mr. G. Yeld, M.A., York, for hybrid irises and hemerocallis.

R.H.S. Silver Flora.—Miss Hemus, for sweet peas.

R.H.S. Silver Banksian.—Mr. G. Yeld, for irises and hemerocallis.

Silver.—Messrs. W. Artindale and Son, Sheffield, for hardy flowers; Mr. C. W. Breadmore, Winchester, for sweet peas; Messrs. J. Backhouse and Son, Lim., York, for greenhouse plants and flowers; Messrs. R. H. Bath, Lim., Wisbech, for hardy flowers. Messrs. E. J. Batchelor and Sons, Harrogate, for hardy flowers; Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; Messrs. Bakers, Wolverhampton, for poppies, etc.; Messrs. Clibrans, Altrincham, for hardy flowers; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. Dicksons, Chester, for hardy flowers; Mr. Engelmann, Saffron Walden, for carnations; Messrs. J. Forbes and Son, Hawick, for phloxes and pentstemons; Messrs. E. W. King and Co., Coggeshall, for sweet peas; Messrs. J. Kelway and Son, Langport, for hardy flowers; Mr. C. Waters, Balcombe, Sussex, for carnations; Messrs. Sander and Sons, St. Albans, for orchids; and Messrs. Seagrave and Co., Sheffield, for violas.

Dracæna Bruanti variegata.—Among the green-leaved dracænas, or more correctly speaking cordylines, which are so popular for many purposes, the variety Bruanti is regarded as very desirable, and it is one generally met with in gardens. A variegated-leaved form of this was shown somewhat extensively at the Temple Exhibition, and when well-coloured it is certainly very beautiful, and one I should say destined to be much grown. As exhibited there is a considerable amount of difference in the extent of the variegation, but in all cases it is of a clear yellow disposed longitudinally for the whole length of the leaf. In some examples quite one-half of the leaf is of that tint, and it forms then a very beautiful decorative plant. One desirable feature of Dracæna Bruanti itself is that well-balanced plants may be grown in quite small pots, and in this way they are especially valuable for dropping into some of the smaller-sized jardinieres, which are in many houses freely used. For dark or copper-coloured receptacles the clear variegation of this dracæna will be greatly in its favour. It will doubtless prove to be of as ready increase as the ordinary form, which can be propagated by cuttings of the tops, or the stems cut up into eyes, while the underground rhizomes, or toes as they are popularly termed, are freely produced, and when taken off they quickly form plants.—W. T.

BATH GRAND ROSE SHOW AND GENERAL SUMMER EXHIBITION.
WEDNESDAY and THURSDAY, July 6 and 7.

Classes for Roses—Nurserymen and Amateurs.
Bouquets, Cut Flowers, Sweet Peas, Strawberries, Plants, and Tuberous Begonias.
Entries close Friday, July 1.

For Prize Schedules, etc., apply
B. R. F. PEARSON, Sec.
Office: 17, Argyle Street, Bath.

BECKENHAM HORTICULTURAL SOCIETY GRAND SUMMER SHOW (open) WEDNESDAY, July 13, Floral Fête; numerous attractions. Two Military Bands.
T. W. THORNTON, F.R.H.S., Hon. Sec.
The Library, Beckenham.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY. 22nd Annual Show. SOPHIA GARDENS, CARDIFF. WEDNESDAY and THURSDAY, July 20 and 21st, 1910. Liberal Prizes in every section, amounting in money and plate to nearly £500. Two Programmes of Music each day by His Majesty's renowned 1st Life Guards Band. A Grand Display of Fireworks each evening by Messrs. W. and J. Wilder, Birmingham. Mr. John Studts up-to-date Fun of the Fair, each day. Tents lighted by the Blanchard Patent Incandescent Oil Lamps. Popular prices. Tickets and Schedules may be obtained from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

PENARTH ROSE SOCIETY'S SHOW,
July 6th, 1910.
Open classes for Roses, Carnations, Sweet Peas, etc.
Band of H.M. Scots Guards.
Schedules, H. A. GERHOLD, Hon. Sec., Penarth.

RICHMOND HORTICULTURAL SOCIETY

The 36th ANNUAL SHOW
On WEDNESDAY, June 29th.
Silver Challenge Cups. Gold and Silver Medals.
Valuable Money Prizes.
Entries close June 22nd.
W. J. COOK, Hon. Sec., Holmsley House, Richmond, Surrey.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Perpetual Carnation Society.

Postponed from May 19 until June 9, the first exhibition of this society held this year was a great success. The competition was keen in all except the smallest amateurs' classes, and the flowers staged were of remarkably fine quality and colour.

OPEN CLASSES.

In the premier class, for the best group of cut carnations, not less than twelve varieties, arranged on a table space 10ft. by 3ft., the flowers associated with foliage plants or cut foliage, the gold medal offered as first prize fell to Mr. W. H. Lancashire, Victoria Vineries, Guernsey, for a splendid lot of blooms of Enchantress, Mrs. Burnett, Winsor, Marmion, Beacon, Rose Doré, Mikado, Britannia, Robert Craig, etc., all represented by from two dozen to fifty flowers. There were six competitors, consequently this class itself made a splendid display. Mr. C. F. Waters, Balcombe, Sussex, was a very close second, his Rose Pink Enchantress, Britannia, Victory, and Red Lawson being very fine. Mr. A. F. Dutton, Iver, Bucks, came third, and he showed three vases of magnificent blooms of Winsor in his collection.

The American Carnation Society's silver cup for three vases of American novelties was won by Mr. W. Wallace, Eaton Bray, with Delight, Afterglow, and Mayday; Mr. B. E. Bell, Guernsey, second; and Mr. H. T. Mason, Hampton Hill, Middlesex, third. Only a second prize was awarded to the class for British novelties, and this was won by Mr. W. H. Lancashire with Rose Doré, Black Chief, and Emperor. The Covent Garden Bowl and added silver medal for sixty blooms each of two varieties, two dozen of each to be shown in boxes as packed for market, and the rest in vases, was won by Mr. W. H. Lancashire, who had superb blooms of Marmion and White Perfection; there were five competitors, and there was only one prize offered, but Mr. Wallace was highly commended for lovely flowers of Enchantress and Winsor.

In the class for twenty-five blooms of a variety of the Enchantress class Mr. A. Smith, Enfield Highway, led easily with wonderful flowers of his new and splendid blush-pink variety named Empire Day, a variety that will oust Enchantress if it is a good grower; Mr. G. Lange, Hampton, second with Enchantress; and Mr. Bell third, also with Enchantress. For varieties of the Mrs. Burnett class and colour, twenty-five blooms, Mr. Lancashire scored with Mrs. Burnett, Mr. Wallace coming second with Delight, and Mr. Bell third with Mrs. Burnett.

For twenty-five flowers of the Rose Pink Enchantress group Mr. Bell led with a grand vase of Winsor; six entries; Mr. G. Lange, Hampton, second; and Mr. Wallace third. There were six entries in the class for twenty-five blooms of the Lawson or similar varieties, and here Mr. Wallace led with Afterglow in the pink of condition; Mr. Bell second with Autocrat, and Mr. Lancashire third with Afterglow. The best twenty-five blooms of any white variety were fine examples of White Enchantress from Mr. W. Wallace; Mr. G. Lange second with White Perfection. For the same number of any scarlet variety Mr. H. T. Mason, Hampton Hill, led with Beacon; Mr. Bell second with Britannia; and Mr. Wallace third with Britannia; there were seven entries in this class.

The best twenty-five blooms of a crimson variety were of Carola, shown by Mr. Engelmann; Mr. Lancashire second with President, and Mr. Bell third with the latter variety. For any other self variety Mr. Lancashire scored with his Rose Doré, followed by Mr. Bell with Mikado. For a fancy variety Mr. Wallace was to the fore with Bay State, a white variety with rose-red flakes.

AMATEURS.

In the amateurs' and gentlemen's gardeners' section the premier award for a group of carnations in pots fell to Mr. A. Grubb, gardener to C. F. Raphael, Esq., Shenley, who was first with a pleasing association of Marmion, White Enchantress, Britannia, and Rose Pink Enchantress, all finely represented; second prize fell to Mr. Paskett, gardener to E. J. Johnstone, Esq., Burrs Wood, Groombridge; Mr. P. Wilkinson, gardener to Sir Daniel Gooch, Bart., Chelmsford, third. Mr. Paskett secured the gold medal for a display of cut carnations arranged on a space 6ft. by 3ft., and did so with an excellent exhibit of fine flowers, well arranged with asparagus, smilax, etc. Mr. Paskett was also first for six plants, but second to Mr. Grubb for three plants.

Messrs. Stuart Low and Co.'s cup for six dark flowers was won by Mr. Paskett with Black Chief, and in the following class he led for six blooms with Mrs. Burnett. In the class for six blooms of a blush variety Mr. J. Vert, gardener to Lord Howard de Walden, Saffron Walden, won with Enchantress; Mr. Usher, gardener to Sir Randolph Baker, Blandford, Dorset, coming second; and Mr. Grubb third.

In the Mrs. Burnett class Mr. Stuart Robinson, The Oval, Kington, scored with six fine flowers, Mr. Paskett and Mr. Usher coming second and third. For six flowers of a rose-pink variety Mr. Vert, Mr. Usher, and Mr. Paskett won in order as placed, with Rose Pink Enchantress. For deeper coloured flowers Mr. Paskett scored with Afterglow, with Mr. Vert second and Mr. Usher third. Mr. Vert led for half a dozen flowers of a white variety with White Enchantress, very fine; Mr. Usher second, and Mr. Paskett third. Mr. Grubb had the best vase of a scarlet variety, showing brilliant blooms of Britannia; Mr. Vert second, and Mr. Paskett third. Mr. Vert scored in the crimson class with Crimson Glow in fine form; Mr. Paskett second; and Mr. Heeley, gardener to S. Morris, Esq., Stafford, third. For any other self variety Mr. Usher led with Mikado, and for any other fancy he also came to the front with Jessica. For a dozen blooms, not less than six varieties, Mr.

Vert was a good first, followed by Mr. Usher and Mr. Paskett.

In the section for amateurs who do not employ a gardener entirely the chief prizewinners were Mr. K. Fuller, Sominly, Berks; Mr. G. H. Lawrence, Stratton, Godstone; and Mr. W. E. Merrett, Atworth.

In the decorative classes the chief prizewinners were: Mrs. Hammond, 116, King's Road, Chelsea; Mrs. A. D. Ruff, Sharnbrook, Beds; Miss Ivy Crane; Messrs. Clark and Cook, Caristhorpe, Bucks; and Mr. Bell, Guernsey.

NON-COMPETITIVE.

Across the top end of the hall Mr. C. Engelmann, Saffron Walden, put up a fine display of cut carnations. It was a great display, and, of course, Mr. Engelmann's new deep crimson variety, Carola, was a great feature, and finely represented by five large stands. The way in which long growths and buds were associated with the flowers suggests that Carola is a grand grower, and that Mr. Engelmann's stock is not a small one. Enchantress, White Perfection, Mikado, Harvard, Britannia, Mrs. Patten, Helen Gould, and Red Lawson were others finely shown. Asparagus and smilax and tiny ferns were freely used in association with the flowers.

Messrs. W. Cutbush and Son, Highgate, put up an artistically arranged group of carnations, associated with crotons, ferns, and bamboos. The separate varieties were grouped distinctly, either as plants in mounds or in great sheaves of cut bloom. Cecilia, White Enchantress, Helen R. Gould, King Arthur, White Perfection, Enchantress, Robert Craig, The President, and the Old Blush and Lady Coventry Malmaison varieties, were well shown.

Messrs. Stuart Low and Co., Enfeld, filled the large circular centre staging with Malmaison and perpetual carnations and ferns. This also was an elegant arrangement, some of the stands and vases of bloom being well elevated above the general level, while from the high central pyramid arching rods carried bowls of blooms. Lady Grimston, Baldwin, Astarte, Helen Gould, and the new Malmaison variety Princess Juliana, were a few of the varieties shown especially well. The firm also showed orchids and miscellaneous plants.

Mr. H. Burnett, Guernsey, showed good blooms of Marmion, White Perfection, Enchantress, Winsor, and Mrs. Burnett, and staged these in large numbers. Mr. J. Green, March, had a good display, and showed Enchantress well. Mr. Paskett, gardener to E. J. Johnstone, Esq., Burrswood, Groombridge, kept his big group of Malmaison carnations over from the R.H.S. meeting; and Mr. G. Lange, Hampton, contributed a large display of finely developed blooms of popular varieties.

Messrs. G. Bunyard and Co. and Messrs. W. Cutbush and Son had displays of hardy flowers, as at the R.H.S. meeting two days previously.

Medals were awarded to the non-competitive displays as follows: Gold: Mr. G. Lange, Mr. H. Burnett, Mr. C. Engelmann, and Mr. Paskett. Silver-gilt: Messrs. Stuart Low and Co. Silver: Messrs. W. Cutbush and Son, and Mr. J. Green.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, JUNE 7.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Sir Albert Rollit, D.C.L., Sir Arthur Church, K.C.V.O., F.R.S., Dr. A. B. Rendle, F.R.S., Messrs. J. Fraser, F.L.S., W. Hales, R. H. Pearson, J. T. Bennett-Poë, M.A., E. M. Holmes, F.L.S., W. Fawcett, F.L.S., and F. J. Chittenden, F.L.S. (hon. sec.).

NOMENCLATURE OF GARDEN PLANTS.—It was reported that the recommendations sent to the Horticultural Congress at Brussels, at which the R.H.S. had been represented by Mr. E. A. Bowles and Dr. A. B. Rendle, had been accepted with scarcely any modifications. These recommendations followed the rules for the nomenclature of flowering plants passed at the Vienna Congress of 1905, with the additions necessary to make them apply to garden varieties and hybrids. They will be published in extenso in due course.

ROSE DE MADERA.—Sir Albert Rollit showed a specimen of the "Rose de Madera" or "Rose de Palo" from Guatemala. The specimen was a woody growth somewhat resembling an open rose about 3 inches in diameter, at the end of a branch about 1½ inches in diameter. These formations are the result of the attack of a parasite, in this case probably a species of phoradendron, on a flowering plant, inducing a considerable development of tissue in the host. Later, the parasite dies, and decays, leaving the tissue of the host intact, showing the impressions where the sucker-like organs of the parasite were in intimate contact with the host. The growths are well figured in Engler's "Pflanzenfamilien," Abt. 1., p. 161.

FUNGUS ON ROOF.—Mr. Hales showed a specimen of a fungus which was growing in quantity, depending from the roof of Chelsea Old Church. Dr. Rendle took it for further examination.

SAXIFRAGA GEUM, ETC.—Mr. John Fraser showed seedlings of Saxifraga geum var. Colvillei, illustrating the great range of variability possessed by seedlings, and the probability of the hybrid origin of some forms. There were 78 seedlings in all, of which some had yet to flower. Of those that had flowered three were like the seed parent, two were hybrid forms of S. umbrosa, 20 were broad-leaved forms of S. geum dentata, two had the primary flowers half-inch in diameter, 17 had creamy-white ovaries, two were like S. geum elegans, and five were like S. geum serrata. Considerable difficulty was often experienced in classifying the forms of this section, since the plants produce two sets of leaves, unlike one another, in the spring and autumn respectively, and botanists had described foliage without reference to the season.

IRIS WITH STANDARDS BEARDED.—Mr. Bowles drew attention to an iris shown by Mr. Perry, a seedling raised by the late Sir Michael Foster, having the spathe valves of Iris pallida, and probably a seedling from that species, but with forked stem. The standards were somewhat drooping instead of being erect, and each had on its upper surface a small amount of bearding similar to that on the falls, but less in extent.

HYBRID PRIMULAS.—Messrs. Veitch, of Chelsea, sent hybrids of Primula pulverulenta and P. Cockburniana, together with the parents for comparison. The series was as follows:

1. P. pulverulenta ♀ × P. Cockburniana ♂ = P. × "Unique," and (2) the reciprocal cross giving P. × Unique and P. × Unique improved.
3. P. Cockburniana ♀ × P. Unique ♂ = P. × "Excelsior." This form has bright flowers nearly approaching P. Cockburniana, but distinct and, like the other two before mentioned, perennial, whereas P. Cockburniana is biennial.
4. P. pulverulenta ♀ × P. Unique ♂ = an unnamed form approaching P. pulverulenta in colour, but of a shade intermediate between its two parents.
5. P. × "Excelsior" ♀ × No. 4 ♂ = an unnamed seedling almost exactly like P. × Unique, and as its history shows the result of combining P. pulverulenta and P. Cockburniana in equal proportions.
6. P. × "Excelsior" ♀ × P. Cockburniana ♂ = an unnamed seedling almost identical with P. Cockburniana, but whether perennial or not has not yet been ascertained.

CHEIRANTHUS HYBRID.—J. S. Arkwright, Esq., of Lyonshall, Herefordshire, sent a hybrid between Cheiranthus Allioni ♀ and C. alpinus. Five or six flowers had been crossed by him in 1908, but only one pod, and from that only one plant, that now shown, had been obtained. The plant, which was very vigorous, being bushy, and measured about 18 inches through, had been flowering for a month. The flowers were bright orange, but not so deep as those of C. Allioni. In the bud they were dark purple, like those of C. alpinus, contrasting markedly with the orange flower. The plant was shown under the name C. × Arkwrightii. It may be readily increased by cuttings.

CROCUS SATIVUS.—In reply to a request for information regarding the cultivation of the Saffron Crocus, Mr. A. W. Hill, M.A., sent the following report:—

The Saffron Crocus is said to have been introduced into England during the reign of Edward III. (A.D. 1327-1377). Two centuries later English saffron was even exported to the Continent, for in a priced list of the spices sold by apothecaries of the North of France, A.D. 1565-1570, mention is made of three sorts of saffron, of which "Safren d'Engleterre" is the most valuable. It was evidently produced in considerable quantities, for in 1682 we find in the tariff of the Apotheke, of Celle, Hanover, Crocus austriacus optimus, and Crocus communis anglicus.

In the beginning of the 18th century (1723-28), the cultivation of saffron was carried on in what is described by a contemporary writer as "All that large tract of ground that lies between Saffron Walden and Cambridge, in a circle of about 10 miles diameter." The same writer remarks that saffron was formerly grown in several other counties of England. The cultivation of the crocus about Saffron Walden, which was in full activity in 1594, had ceased in 1768, and about Cambridge at nearly the same time. Yet the culture must have lingered in a few localities, for in the early part of the 19th century a little English saffron was still brought every year from Cambridgeshire to London, and sold as a choice drug to those who were willing to pay for it.

At the present day, this product is chiefly produced in Spain, the commercial variety distinguished as Best Valencia realising from 42s. to 42s. 6d. per lb. (April 23 last).

According to the latest reports from Spain, supplies are difficult to obtain, and as a large proportion of the bulbs have been destroyed by drought, the outlook for the next crop is serious. A considerable quantity of saffron is annually produced in Persia, but little or none of this finds its way into European commerce.

Birmingham Botanical and Horticultural Society.

The annual show of orchids and early summer flowers was held at the Botanical Gardens on June 8 in fine weather. There was a grand display of orchids, climbing roses in pots, and a capital attendance of visitors, who also enjoyed a ramble among the rhododendrons and the alpine garden, now at their best.

Prizes, in the form of medals, were offered for orchids, carnations (cut), flowering or foliage plants, and violas. The five collections of orchids were the leading feature, and the gold medal of the society was awarded to Mr. W. Waters Butler, Edgbaston, for a splendid display occupying a space of staging 30ft. long by 8ft. wide, and it was most artistically arranged by Mr. R. H. Jones (the gardener), who eclipsed himself by staging the finest collection of orchids ever shown here. Silver-gilt medals were awarded to Messrs. Mansell and Hatcher, Rawdon, Leeds, for a considerably smaller display, distinguished by the richness of the flowers. A similar award was granted to a very good collection from the Right Hon. Joseph Chamberlain's gardens at Highbury, which was effectively arranged by the grower, Mr. J. Mackay. Silver medals were awarded to Sir George Kenrick, Whetstone, Edgbaston, for a collection of miltonias staged by Mr. J. V. Macdonald; and to Mr. R. Fenwick, Edgbaston, for a mixed group.

Messrs. Gunn and Sons, of Olton, were awarded a silver-gilt medal for climbing roses, sweet peas, and Viola cornuta purpurea and V. c. alba; the latter presented a charming little parterre, and was much admired by the visitors. To Mr. George Prince, Oxford, a silver medal was awarded for a brilliant group of decorative roses, in which the good old Austrian Briar stood out in bold relief. To Messrs. Robert Sydenham, Lim., for an excellent arrangement of sweet peas, in their rustic stands, was awarded a bronze medal. Messrs. Bakers, Wolverhampton, were awarded a silver medal for Oriental poppies, pyrethrums, lupins, and violas. Mr. C. H. Herbert, Acocks Green, was accorded a silver medal for a large stand of his unique and popular perpetual-flowering pink, Progress, and two or three seedling pinks of much promise.

A cultural certificate was awarded to George Cadbury, Esq. (gardener, Miss Gertrude Cope), for a hybrid calceolaria, represented by three very large and bushy dwarf plants in pots, evidently suitable for the flower garden, with medium-sized inflorescences, having a yellow ground with brownish-crimson spots. Awards of merit were granted to Messrs. Sander and Sons, St. Albans, for Marguerite Mrs. F. Sander; to Mr. G. W. Miller, Wisbech, for Pyrethrum Queen Mary, a beautiful double, blush-pink variety.

Competitive cut flowers were only represented by violas, of which there was not so large a competition as might have been expected. In the class for twelve violas, distinct, not less than five blooms each, to be shown in shallow vases, Mr. J. Delbridge, Penkridge, won the first prize with very good examples of Agnes Kay, Cream King, Peace, J. E. Erskine, Willie Farmer, Jeannie Houston, Bronze Kintore, Mauve Queen, Isolde, Mrs. Chamberlain, A. S. Frater, and Admiral of the Blues; second, Mr. C. Holder, New Oscott; and third, Mr. H. Anderson, Ivy Lodge, Shirley.

For six varieties, distinct, Mr. H. S. Pratt, Selly Hill, Birmingham, staged very good flowers of A. S. Bastell, Moseley Perfection, Connie Robertson, Mary Burnet, A. S. Frater, and George Dunn; second, Mr. George Tilt, 77, Caruon Road, Erdington; and third, Mr. H. H. Wheldon, Wentworth Road, Harborne.

Liverpool Horticultural Association.

A meeting of the committee and friends of this society and the executive of the Liverpool Auxiliary of the G.R.B.I., met at the Childwall Abbey on the 8th inst. to do honour to Mr. T. Foster, who has rendered fourteen years of valued services as chairman of the association. Mr. W. Mercer presided over the large gathering, all interested in horticulture, and on behalf of those present and some absent friends, presented their esteemed guest with a handsome gold keyless watch as a mark of their appreciation of his excellent work on behalf of the association, together with the earnest wish that he would enjoy his well-merited ease.

Messrs. J. Stoney, J. J. Guttridge, and C. A. Young also bore evidence to the value of their guest's able assistance in the cause of the premier horticultural society of the district. Mr. Foster expressed his thanks, and alluded with much feeling to the many pleasant hours he had worked with them on behalf of the association.

East Anglian Horticultural Society.

The June monthly meeting was held at the Boar's Head Hotel, Norwich, on the 8th inst. Mr. Lewis Smith (Shotesham) was in the chair. The secretary, Mr. W. L. Wallis, stated that the summer outing of the society would be held on July 14, to Flixton Hall Gardens, by kind permission of Sir Fredk. Adair, Bart.

The subject of the evening was an essay competition upon "The Cultivation of the Pear," and three most practical and interesting papers were received and read, after which they were adjudicated upon, and the awards given, 1st, to Mr. C. Matthews, Thorpe; 2nd, to Mr. C. H. Fox, Old Catton; and 3rd, to Mr. J. Ewing, Wye. The president opened the discussion with some pithy practical points, and it was well taken up by Messrs. J. Forder, C. Burtenshaw, J. Powley, W. Coan, J. H. Clements, T. Notley, and other local fruit growers.

There was a splendid show of flowers upon the tables. Mr. F. Williams, gardener to Louis Tillett, Esq., Catton, had some hardy orchids; Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, brought up grand spikes of Primula japonica, and other hardy flowers. Mr. Frank Neave showed pretty aquilegias, as also did Mr. C. H. Fox. Messrs. Daniels Bros., Lim., showed Olearia Gunni covered with blossoms. There were no fruits exhibited, and vegetables were fewer than usual.

Bournemouth Gardeners' Association.

On Tuesday, June 7, under the chairmanship of Mr. J. B. Stevenson, the members met for questions and discussion. A few dates each year are set aside for such a purpose, and it has been found to be a very popular one. So many questions were put down on the slips of paper at the last meeting that it was found impossible to deal with them all, and some were held over to a future meeting.

The following were some of the more important questions asked and discussed: Treatment of Boronias; Cuttings versus Seedlings of Lobelia for Bedding; The Best Six Orchids for Cut Flowers; The Best Way to Summer and Winter Prune Bush Apple Trees, and the Right Dates for Carrying Out the Work; and The Best Six Cactus Dahlias for Cut Flowers. A lengthy discussion followed the introduction of several questions, especially the one on the pruning of bush apple trees.

Before the meeting closed the chairman called the attention of the members to the forthcoming private rose show, to be held on July 1, at Michelgrove House, by kind permission of Walter Childs Clark, Esq., who is generously defraying all expenses. The exhibitors are to be confined to the members of the association and others specially invited by Mr. Clark, who, having invited the members to pay a visit to his garden, kindly added the rose show as a special feature. A hearty vote of thanks to Mr. Stevenson for presiding brought to a close a very enjoyable evening.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday evening, June 13. Mr. Charles H. Curtis in the chair. Six new members were elected, making a total of 45 for the six months. The death certificate of Mr. A. H. Hobbs was produced, and a cheque for £11 8s. 3d. was directed to be paid to his executor for the use of his daughter, the above sum being the amount standing to the late member's credit. The amount of sick pay since the last meeting was £41 16s. 6d. A member was granted 30s. from the Convalescent Fund to assist him in having a change of air after illness.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

DISEASED PEACHES.—W. C. F., Renfrew: We are having the matter investigated, and hope to report in an early issue.

SCENTLESS MUSK.—A. W. J., Ecton: So far as our experience goes musk is as fragrant this year as usual. What position is yours growing in?

BROWN SPOTS ON FICUS LEAVES.—G. B., Bournemouth: If you will be good enough to forward specimens of the variegated ficus leaves, showing the brown spotting complained of, we will do our best to solve the difficulty.

BAD GERMINATION OF PEAS.—L. S., Carlisle: We have received numerous complaints of bad germination in culinary peas, and have ourselves experienced some trouble in this direction. In several instances we have had to transplant the comparatively few seedlings raised in one row to make good the deficiencies of a second row. The fault does not lie at the door of any particular seedsman or nurseryman, as we have sown culinary peas from at least four distinct sources, and germination has been bad throughout. The fault lies with the wet season of 1909, and the lack of autumn sunshine; these prevented the seed peas from ripening properly, and vast quantities had to be gathered wet and dried artificially, hence the great loss of vitality and consequent high percentage of failures in germination.

FEEDING TOMATOES.—A. T. S., Yeovil: If one or two trusses of fruit have set you may commence feeding the tomatoes, assuming they have a limited root run. If only a moderate amount of soil has been provided the roots will be showing through the surface, and a good top-dressing of loam and old manure, or loam and a suitable patent manure will be the best method of feeding. Later, when the strain of fruit bearing becomes heavier, weekly waterings with liquid manure will materially assist the plants. The end plants have failed to set their flowers because they are shaded by the adjacent house, or have been allowed to dry at the roots.

BLACKENED CHESTNUT SHOOTS.—M. L., Leicester: The blackened leaves and shoots are due to the low temperature and bitterly cold winds that prevailed some time ago just when the growth and foliage were extremely tender. We have noticed a large number of trees similarly affected, particularly in places where the north and north-east winds came sweeping along a road. Since the recent rains and warmer weather the trees have made new growths, and doubtless your specimens will recover also.

DAHLIAS.—F. E., Colchester: You will find the kind of information you require in "Dahlias and their Cultivation," a useful little work, to be obtained post free for 1s. 2d., or 1s. 8d., from the Gardeners' Magazine office, 148, 149, Aldersgate Street, E.C.

SEAKALE.—P. J., Loughborough: There should be no delay in carefully examining the plantations of young seakale, because it is essential that all the vigour of the plant should go towards making up a stout single crown for forcing during the coming winter. In all probability there are numerous shoots on each plant, and all but the finest and best placed of these should be removed. Hoe between the rows, first giving the plantation a good dressing of soot.

CLEAR SOOT WATER.—C. E. P., Hampton: We have great faith in clear soot water as a useful plant food for either flowering or fruiting plants. Soot water deepens the green of foliage, purifies the white in flowers, and intensifies the bright colours, but the great mistake made in its use are its application at a too early period in the annual growth of the plant dealt with, or its application in a thick, dirty condition. In the latter case the soil becomes clogged and sour, and so the plants suffer considerably. The proper way to prepare soot water is to suspend a peck or two of soot in a canvas bag in a tub of water. The water should stand for twelve house before use. If the bag is of sufficiently close and fine material the water will not be really discoloured.

AURICULAS.—H. C. B., Headingley: We are glad to find that the renewed popularity of the auricula shows no signs of flagging, indeed the exhibitions of auriculas this year have proved that this old florists' flower is obtaining a greater hold than ever upon the flower-loving public, especially among amateurs whose garden space is limited. Both show and alpine varieties are now largely grown in the South, as well as in the Midlands and the North. Although comparatively simple in their requirements, it is very easy to fail in cultivating them successfully, and we would advise the beginner to commence with the alpine varieties and to master their culture before devoting attention to the less vigorous show varieties. It is necessary to repot them annually, and the most suitable period is immediately the flowering season is past. Use a mixture consisting of mellow turfy loam, four parts; leaf-mould and silver sand, one part each, and a sprinkling of charcoal. Shake away the old soil in repotting, put the small plants in three-inch pots, and the others into pots five inches in diameter. Place on the north side of a wall after repotting, protect from heavy rains, and remove to the frame in August. Ventilate freely during autumn and winter when the state of the weather will permit, and at all seasons of the year water carefully.

CUT FLOWERS ON TABLES.—F. H. T., Slough: In the arrangement of cut flowers, whether for the dinner-table or the drawing-room, it is essential to avoid overcrowding on the one hand, or poverty of material on the other, for in neither case is the effect produced satisfactory. In the use of cut flowers there is often a waste through an insufficient supply of foliage with which to form a background, or a base or undergrowth upon which to arrange the flowers. With a moderate supply of suitable foliage and fern fronds, a tasteful and highly effective arrangement can be produced with a moderate quantity of flowers. The primary point in filling a vase or epergne is to make every flower tell, for when this principle is carried out the effect is greatly enhanced, and the flowers economised. To those who are addicted to overcrowding it may be said that so far from a mass of colour being pleasing, it soon becomes wearisome, and palls upon the taste. Another serious mistake is to use too many colours in one design. Two distinct colours are quite sufficient, and these should be chosen to harmonise with each other, and if furnished by the same genus the effect will be more satisfactory. It is desirable also to use flowers of the same character in each receptacle, as, for instance, roses, sweet peas, carnations, and chrysanthemums, of shades of colour that are in perfect harmony. Vases filled with one kind of flower in association with suitable foliage, preferably their own, are invariably satisfactory.

NAMES OF PLANTS.

F. H., Reading.—Choisya ternata.

T. B., Co. Down.—Polygonum bistorte.

H. J. W.—The selaginella is S. cæsia, and the orchid Brassia brachiata.

G. S., Ryde.—Probably Campanula Portenschlagiana; a poor specimen.

A. M. C., Chester.—1, Odontoglossum concinnum; 2, O. excellens; 3, O. ardentissimum.

E. S. W., Brentwood.—1, Selaginella Kraussiana; 2, Lygodium dichotomum; 3, Asparagus Sprengeri.

M. E. J., Wolverhampton.—1, Ranunculus aconitifolius; 2, Centranthus ruber; 3, a young shoot of physalis, and, judging from the breadth of the foliage, it is P. Francheti.

OBITUARY.

◆

MR. H. CANNELL, JUN.

It is with much regret that we record the death of Mr. H. Cannell, jun., the eldest son of Mr. Henry Cannell, V.M.H., which occurred at Swanley on the 12th inst., from blood poisoning. Mr. H. Cannell, jun., has from his youth upwards taken an active part in the management of the business, and, possessing much taste, he devoted a large share of his attention to the department concerned with cut flowers and floral decorations. His wife died a few years since, and he has left a son and daughter. Mr. and Mrs. Cannell and other members of their family have our fullest sympathy in the loss they have sustained.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

East Cowes Horticultural Association.—Summer Show in the Town Hall on July 26 and 27; Autumn Show in the same place on November 10 and 11.

Potter's Bar Horticultural Society.—Forty-first Exhibition at Little Heath Wood on July 14.

Potter's Bar Rose Society.—Seventh Exhibition at Little Heath Wood, on July 14.

Bishop's Waltham Horticultural Society.—Thirty-sixth Show, to be held in The Palace Ruins on July 27.

Luton Rose and Sweet Pea Society.—Annual Exhibition is now fixed for July 20, at Wardown Park.

Brighton Horticultural Society.—Rose and Sweet Pea Show, to be held in The Dome and Corn Exchange, on July 5 and 6; Chrysanthemum Show on November 1 and 2.

THE FLOWER GARDEN.

By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

THE FLOWER GARDEN

A Complete Guide to Planting and Management of the Flower Garden and the Cultivation of Flowers, Plants, Trees, &c., adapted for Outdoor Culture.

THE CONTENTS INCLUDE—

Fashioning the Garden.
Beds and Borders.
Walks and Paths.
Lawns and Tennis Courts.
Rockeries and Ferneries.
Arbours, Summerhouses, Arches, and Pergolas.
Edgings.
Walls and Fences.
Garden Practice.
Propagation.
Colour Arrangement.
Bedding.
Annuals and Biennials.
Bulbs.
Hardy and Tender Border Plants and Flowers.
Climbing Plants.
Trees and Shrubs.
Pests and Diseases.

480 PAGES, ILLUSTRATED BY 64 PLATES OF BEAUTIFUL GARDEN SCENES, PLANTS AND FLOWERS, AND MANY EXPLANATORY DIAGRAMS.

ORDER FORM.

To the Publishers of "THE GARDENERS' MAGAZINE,"
148 and 149, Aldersgate Street, London, E.C.

Please send me a copy of "THE FLOWER GARDEN" by Post, for which I enclose remittance of 8/-.

NOTE OF THE WEEK.

◆

Feeding Crops.

The weather, if not exactly all the cultivator could desire, has this season been so far favourable to planting operations and to advancing crops that active and otherwise satisfactory progress is evident in both flower and kitchen garden. In beds and borders the plants by which the spring flowers were replaced early in the month for the production of summer effects have been so liberally assisted by the rains that they have become well established, and are making such vigorous growth as to suggest that they will at no distant date contribute liberally to the attractions of the flower garden. Herbaceous plants have also derived substantial assistance from the timely and copious rains, and where other conditions have been favourable to their development are yielding freely of their floral wealth, or promising to attain to a remarkably high state of development in due course. If we turn to the kitchen garden we find the various crops that were sown or planted late in the autumn or early in the spring are making equally satisfactory growth, and that those which were raised under glass, and subsequently transferred to the open quarters, have taken root, and are giving ample evidence of their not having experienced any appreciable check in the process of removal. The progress that is being made by vegetation in all departments of the garden should be highly gratifying to the cultivator, inasmuch as it shows that his labours are not failing to obtain their due reward, and we are making reference to it for the purpose of pointing out that where assistance from plant food is required by either ornamental plants or useful crops, the present time affords a favourable opportunity for giving it. Top dressings of artificial fertilisers and applications of liquid manure can be given with much greater advantage when there is a liberal percentage of moisture in the soil, and the roots are in an active state, than is practicable when the soil is comparatively dry and growth is making but little progress. This is explained by the fact that artificial fertilisers quickly dissolve in the presence of moisture, and so readily diffuse through the soil with its aid that their nutrient properties are soon placed within reach of the roots. The conditions are somewhat different in the case of liquids containing plant food, but as so well known to experienced cultivators, liquid manure of all kinds is the most beneficial in its effects when the soil is more or less moist at the time of its application. The condition of the plant at the time of feeding is not less important than the state of the soil, for when food is placed in an assimilable form within reach of the roots when growth is active, it is much more quickly taken up and utilised by the plant than after a period of inactivity of the root system, such as is brought about by an insufficiency of soil water. To ensure the fullest measure of success in plant culture it is essential the progress should be continuous, and where it is considered desirable to supplement during the period of growth the manurial dressings applied at the time of soil preparation, the application should be made without delay. The most suitable fertilisers for present use, and the manner of application will, in a large measure, depend upon the requirements of the particular plants and crops, and consequently their selection and use must be left to the judgment of the cultivator. Liquid manure should be taken full advantage of in the feeding of crops of all kinds, and be used in a moderately diluted state. Speaking in general terms of fertilisers other than those in a liquid state, it may be said that they should be sufficiently rapid in action to enable the plants to take advantage of the assistance they are able to render within a comparatively short period of their application, as the object is not so much to permanently enrich the soil as to feed the present crops. Nitrate of soda and sulphate of ammonia are quick in action, but they are both nitrogenous manures, and the tendency of these to promote excessive leaf development must be constantly kept in view. The best course is to associate with them a phosphatic fertiliser, and the most useful at the present time is that known as dissolved bones, which is moderately quick in action, and is of special value in promoting seed and fruit development, and in the promotion of a strong, firm growth. A dressing consisting of one part of nitrate of soda and two parts of dissolved bones applied at the rate of three ounces to the square yard, and lightly hoed in will be of immense assistance to all crops and plants in need of additional food supplies. Some of the artificial fertilisers offered in our advertisement pages are especially useful as top dressings at this season of the year, containing, as they do, nitrogenous and phosphatic constituents in due proportions, and in a readily assimilable form. Summer bedders will not need help in this direction, but hardy perennials that occupy beds and borders of a permanent character derive much help at this season of the year from a top dressing of artificials of the character indicated, and were this to be regarded as an essential part of their summer management we should see a manifest improvement in their conditions in many gardens. The feeding of fruit trees in a healthy state may be most satisfactorily accomplished at the present time, as the cultivator is in a position to exactly gauge the necessities of each tree. If moderately vigorous, and the crop good, a dressing such as that mentioned above will render valuable aid in bringing the latter to perfection, and in the maturation of the growth. On the other hand, should the crop be light and the tree in a vigorous

MR. H. R. DARLINGTON.

state no dressing should be applied, as it would probably do more harm than good. As a matter of course, the hoe should be in constant use in both the flower and kitchen garden, for the purpose of keeping down weeds and maintaining a loose surface. Weeds are not only objectionable to the eye, but they rob the soil of the plant food it contains, and when allowed to attain to any considerable degree of development, deprive them of a large proportion of light and air, and thereby render full development impossible. Material assistance may be rendered useful crops and ornamental plants of a permanent character by the judicious use of mulching materials, as these will greatly check the evaporation of moisture, and thereby enable the plants to draw freely upon the supplies of plant food within the soil; and should half-rotted manure from stable or farmyard be used, it will serve the double purpose of enriching the soil and conserving the moisture.

Mr. H. R. Darlington has for some years past occupied a prominent position among amateur horticulturists, and in the gardens of his residence at Potters Bar there is ample evidence that he has a strong affection for the more beautiful forms of plant life, and possesses in a marked degree a great breadth of taste in matters horticultural. While fully appreciating the manifold charms of the occupants of a well-furnished garden, Mr. Darlington has given special attention to roses and daffodils, and in the cultivation of these two important classes of flowers he has achieved much success. With daffodils Mr. Darlington has obtained honours at the more important exhibitions, both in London and the provinces, and many must be the awards that have been obtained in spirited contests. As a cultivator of roses Mr. Darlington has obtained a full measure of success, and as honorary secretary of the Potters Bar Rose Society he has done much to stimulate an interest in roses among residents in the district. While growing and loving his roses and daffodils, Mr. Darlington has devoted considerable attention to the scientific side of their culture; and with reference to daffodils he contributed some time since a paper to the Journal of the Royal Horticultural Society on the daffodil fly, whose grubs do in some districts considerable damage to the bulbs. Mr. Darlington has for some years past been an active member of the Council of the National Rose Society and of the Publications Committee of the society, and he has been a liberal contributor to the "Rose Annual"; and in one of his articles in the current issue he shows how well he is acquainted with the species. At the present time Mr. Darlington is engaged in the difficult task of preparing a colour scheme, with special reference to roses, and we heartily wish him success, for it is most desirable that something should be done to ensure a greater degree of uniformity in the description of the varied hues of these flowers.

Changes in the London Parks.—We understand that several important changes in the administration of the parks under the London County Council are about to take place. Mr. J. W. Moorman, so long superintendent of the Victoria Park, retires at the end of the present month, and will probably be succeeded by Mr. Carson, from Southwark Park. The other important changes are Mr. F. W. Wright, from the Embankment Gardens to Southwark Park, and Mr. Warren, from Ruskin Park to Southwark Park. In each case the superintendent rises into a higher position and in a higher grade; most of our readers are aware that the parks of London are divided into first, second, third, and fourth-class parks.

New Roses at Bagatelle.—Mr. Arthur W. Paul, who has been acting as one of the judges of new roses in the gardens of Bagatelle, Paris, kindly sends us the following: "Owing to the unfavourable season or other causes the flowering of the new roses was not very satisfactory, and out of the 69 varieties of 1908-9 submitted for trial none were considered worthy of the two gold medals placed at the disposal of the judges by the city of Paris. The varieties in the best condition on the day of the judging (18th inst.) were: Colonel Leclerc (H.T.), Commandeur Jules Gravereaux (H.P.), Elaine (H.T.), Entente Cordiale (H.T.), Grace Molyneux (H.T.), His Majesty (H.T.), Jules Levacher (Wich.), Lady Alice Stanley (H.T.), Lady Ursula (H.T.), Marie Mascurand (H.T.), Madame Ruan (Pern.), Molly Sharman Crawford (T.), Mrs. Alfred Tate (H.T.), and Senateur Mascurand (H.T.). These received seven or eight marks each, out of a possible ten, and the four following were ultimately selected for Certificates of Merit: Molly Sharman Crawford, Lady Alice Stanley, Marie Mascurand, and Commandeur Jules Gravereaux. Of the varieties of 1909-10 provisionally inspected with a view to adjudication next summer, the following were in the best condition: Beauté de Lyon (Pern.), 10 marks; Jonkheer J. L. Mock (H.T.), and May Miller (H.T.), 9 marks each; and Eugène Boullet (H.T.), Gaston Bonnier (H.T.), Lieutenant Chaure (H.T.), Nathalie Böttner (H.T.), Rena Robbins (H.T.), Theresa (H.T.), Tip-top (Poly.), and William Speed (H.T.), 8 marks each. It was remarked that the fine collection of older plants of weeping, climbing, and other roses in the gardens of Bagatelle, which were in full bloom at the time, also scarcely exhibited their customary vigour of health and growth."

Horticultural Club.—The date fixed for the summer excursion of the Horticultural Club is Saturday, July 30, when, at the kind invitation of N. N. Sherwood, Esq., the members will visit Prested Hall, Kelvedon, his Essex residence. Communications relating to the excursion should be addressed to Mr. H. J. Veitch, Royal Exotic Nurseries, Chelsea, S.W.

Rhododendrons at Regent's Park.—Messrs. J. Waterer and Son's fine exhibition of rhododendrons in the Royal Botanic Society's gardens, Regent's Park, continues to attract a large attendance of interested visitors. The display is a very large one, and, as usual, is composed entirely of flowering plants of various sizes, ranging from two feet to ten or twelve feet high, and all effectively disposed in beds and borders, so as to form a lovely rhododendron garden. Grass borders run round the groups and borders, and there are ample paths between, while, as the garden provides considerable differences of altitude, it is not possible to see the whole at once, and thus at every turn there is a new attraction. The central feature of the display consists of a large conical group of the lovely Pink Pearl, with such fine varieties as Gomer Waterer and the new Alice close by. The brilliant scarlet, crimson, and rosy-scarlet varieties, so many of which are named after a member of the Waterer family, provide grand bits of colour, but the beautiful pink, white, blush, and light purple varieties are even more telling in their setting of deep green foliage. It is no small thing to create a rhododendron garden of these dimensions for exhibition purposes, but not only does the Bagshot firm create it, but maintains it in splendid condition for a full month. Another week remains, and our readers who have not yet done so should make an effort to see these fine rhododendrons so delightfully arranged.

"Botanical Magazine" for June.—The plants figured in the issue of the "Botanical Magazine" for June are Fourquieria splendens, a handsome species of much interest, native of Mexico or Central America; Kalmia cuneata, a beautiful species that has its home in Carolina; Scutellaria violacea, an Indian species, bearing racemes of violet flowers marked with white blotches on the lip; and Cirrhopetalum biflora, a distinct species, with large and showy flowers freely spotted with purple.

Investigation of Sweet Pea Diseases.—A number of members of the National Sweet Pea Society having experienced considerable anxiety on account of the obscure maladies known as "streak" and "yellowing," the General Committee has appointed a Special "Disease" Sub-Committee to obtain information, with a view to ascertaining the nature of the maladies, whether they are directly traceable to fungi or bacteria, and what are the best preventive or remedial methods to adopt. The members of the sub-committee are Messrs. R. Hooper Pearson (chairman), Robert Boxall, M.D., William Cuthbertson, J.P., Charles Foster, G. W. Leak, and H. A. Perkin. It is proposed to include in the inquiry all diseases or pests that may be found to attack the plants; therefore, members are invited to send specimens of plants which have proved unsatisfactory, for examination and report. The Special Committee has been promised the kindly assistance of Dr. F. Keeble, M.A., of Reading, and Mr. F. J. Chittenden, F.L.S., of Wisley, and these gentlemen will examine microscopically all the specimens received. To facilitate the work of the special "Disease" Sub-Committee a set of questions has been prepared. All members of the society are invited to answer the questions, but it is essential that those who send specimens of diseased sweet peas for examination should do so, and enclose their answers, in duplicate, with the specimens. The entire plant should be sent, including the root, and, where possible, duplicate specimens in separate packages should be enclosed, so that they may be easily and quickly forwarded to the experts. Packing should be done firmly, in moist material, and in a strong box, and the packages forwarded, carriage paid, to Mr. R. Hooper Pearson, 41, Wellington Street, Strand, W.C.

Rose gigantea has recently flowered in the Himalayan section of the Temperate House at Kew, the flowers having been developed on the young growths at the top. The specimen was planted at the foot of a pillar fifteen years since, and has grown with great vigour throughout the whole of the period it has occupied its present position. This is the second time this Burmese rose has flowered in England, the first time being at Albury Park, Guildford, the seat of the Duke of Northumberland.

Spraying Fruit Trees with Bordeaux Mixture. In a contribution to the "Journal" of the Board of Agriculture Mr. E. S. Salmon deals at length with the injury that is sometimes done to the foliage of fruit trees sprayed with the well-known Bordeaux mixture. He suggests that in view of the fact that it is practically impossible in this country to keep any considerable acreage of apples free from "scab" or "black spot" without spraying with Bordeaux mixture, and that while the use of this mixture is being followed by complete success in many districts, in others "Bordeaux injury," to a greater or less extent, has followed the spraying, the fruit grower should pay attention to the following details in spraying: (1) Use a "Bordeaux nozzle," which throws a fine "misty" spray; spray the trees lightly, and leave off before the trees begin to drip. (2) Distinguish between the different varieties of apples, giving those which are liable to show "Bordeaux injury" a very light spraying with Bordeaux mixture made of 3lb. copper sulphate, 3lb. quicklime (in lumps), 50 gallons of water; or spray such varieties experimentally with the lime-sulphur wash. (3) Concentrate attention in spraying on those varieties whose leaves get "sooty" with the "scab" fungus, and whose young wood gets "scab"-infested; varieties "resistant" to "scab" do not, as a rule, require to be sprayed. (4) Spray directly the blossom has fallen, and, where necessary, again when the apples are about three-quarters grown. (5) Use freshly mixed home-made Bordeaux mixture prepared from the best freshly-burnt quicklime (in lumps).

Mr. J. W. Anderson, a member of the gardening staff of the Royal Botanic Gardens, Kew, has, we learn from the "Kew Bulletin," been appointed assistant curator in the Singapore Botanic Gardens.

Pyrethrums and Pæonies from Langport.—Some fine blooms of charming varieties of herbaceous pyrethrums and pæonies have reached us from Messrs. Kelway and Son, Langport. Those of the first-named included General French, brilliant crimson; Goring Thomas, soft rosy lilac; Snow White, white, with pale yellow-green disc; Langport Scarlet, vivid crimson-scarlet; Lord Milner, rich reddish rose; and Queen of the Whites, white, all grand single varieties; while among doubles there were fine representations of Evelyn, deep rose with white centre; Source, creamy white; and Lord Rosebery, crimson. Of special merit among the pæonies were Eileen Kelway, cream-white; Mrs. Asquith, an immense flower of a silvery-pink hue; Mrs. Davidson, cream, suffused with rose-pink; British Empire, rose colour, with golden centre; and Queen Alexandra, ivory - white. Messrs. Kelway and Son inform us that they were awarded a silver-gilt medal for their collection of pæonies, delphiniums, and other cut flowers at the York Gala, and not a silver medal, as stated in the official list.

Ryde Rose Show.—The Rev. G. E. Jeans informs us that the observance of Coronation holiday has been changed by the Ryde Town Council from Tuesday next to Monday, the 27th inst., and, in consequence thereof, it has been necessary to change the date of the Isle of Wight Rose Show to the 27th inst.

National Amateur Gardeners' Association holds a large exhibition in the Royal Botanic Society's Gardens, at Regent's Park, on Saturday, July 9, and the show will be open at three o'clock. Valuable prizes and medals are offered, and there will be a military band in attendance.

R.H.S. Hall Struck by Lightning.—We learn that on Wednesday a vivid flash of lightning struck one of the chimney stacks at the Royal Horticultural Hall, Westminster, dislodging a great deal of masonry, but no very serious damage has been done.

ROYAL HORTICULTURAL SOCIETY.

There was a good general display at the Royal Horticultural Hall on Tuesday, June 21, but there was not the crowding of either exhibitors or visitors as at the previous meeting. Novelties were few and not of outstanding importance. Hardy flowers were extensively displayed, and in a number of cases the groups were a mere jumble of flowers, neither care nor taste having been expended in their arrangement.

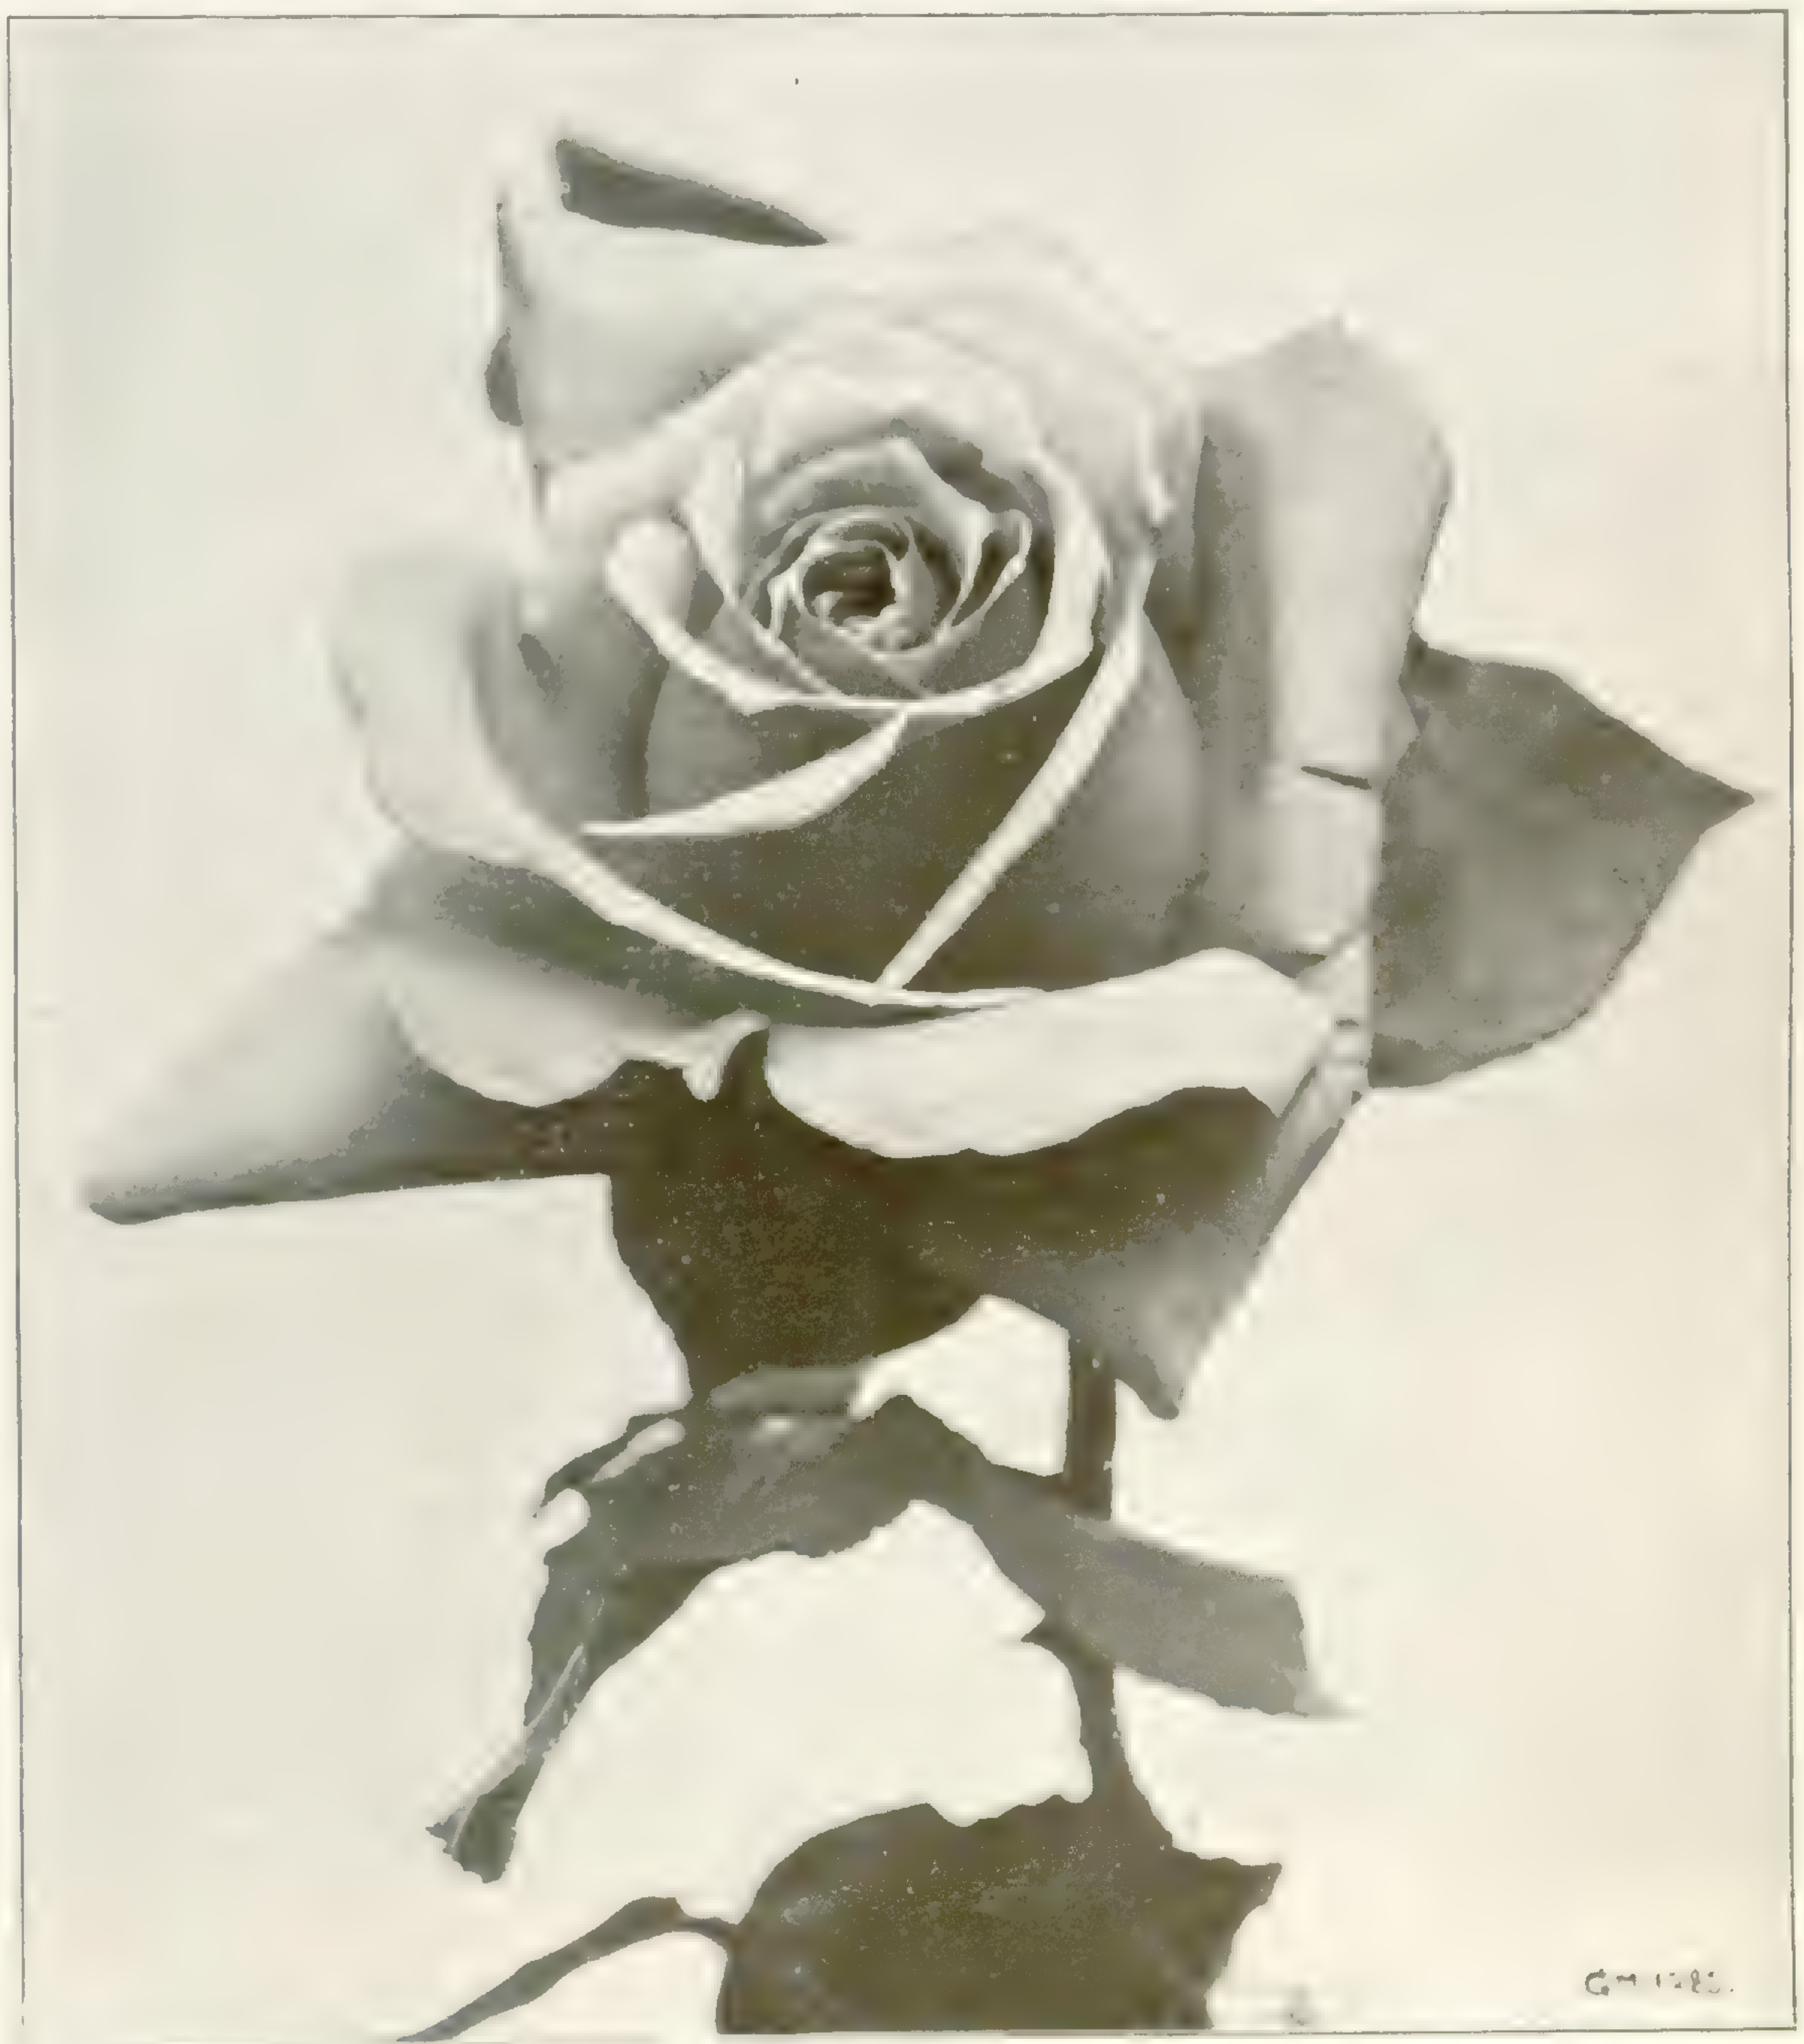
FLORAL COMMITTEE.

Messrs. Barr and Sons, Covent Garden, confined their attention to irises and ixias, and made a charming display with these beautiful flowers; Spanish irises and varieties of I. Kæmpferi were especially well represented.

Messrs. H. B. May and Sons had a very pleasing exhibit of ferns, and these had a cool and refreshing appearance; davallias, nephrolepis, gymnogrammas, and adiantums were the chief kinds shown. The carnations from Mr. H. Burnett, Guernsey, were splendid, especially the fine blooms of Marmion, Mrs. H. Burnett, and Mikado. Messrs. D. Prior and Son, Colchester, had some grand roses, their cut flowers of Lady Ashton, Frau Karl Druschki, White Maman Cochet, Dean Hole, Bessie Brown, and Melanie Soupert being of remarkable size, substance, and colour.

Some giant plants of the yellow Primula imperialis were brought from Penryn by Messrs. R. Gill and Sons, who also had Chrysanthemum maximum Mrs. Leigh, Escallonia exoniensis, and the brilliant Embothrium coccineum. Messrs. James Veitch and Sons, Chelsea, had graceful standard fuchsias rising above batches of gorgeously coloured cannas, perpetual carnations, and the rosy-red Kalanchoe Kewensis Excelsior (A.M.), a very showy plant; the same firm submitted a great variety of English and Spanish irises, the deep blue Prince of Wales standing out conspicuously among the former.

A bank of roses from Messrs. B. R. Cant and Sons, Colchester, was notable for its bunches of Ma Capucine, Mrs. Aaron Ward, Meta, Souv. de Catherine Guillot, Jean Note, and General McArthur. Mr. Amos Perry, Enfield, had a very fine display of pæonies, poppies, and delphiniums, and among the latter we were specially interested in the varieties Amos Perry, Dragonfly, Mdme. E. Zaiser, Pluto, Mdme. V. Geslin, Perfection, Masterpiece, and Persimmon. Iris fulvata (A.M.), purple and green, was sent by Mr. W. R. Dykes, Charterhouse, Godalming; it is a showy hybrid from I. fulva and I. hexagona Lamancei.



H.T. ROSE FREDA.

A beautiful new Hybrid Tea with rich pink flowers. A.M., R.H.S., June 21. Messrs. Paul and Son, Cheshunt.

Messrs. Paul and Son, Cheshunt, brought up a large collection of pæonies, but the flowers showed the effects of the heat; Lady Carrington, Jules Calot, Berlioz, Mdme. Bollet, and Lucy Malard were among the best. A new rosy H.T. rose named Freda (A.M.), and tall red-fruited spikes of Rheum palmatum rubrum were also shown by the Cheshunt firm. Mr. R. C. Notcutt's bright contribution of hardy flowers contained good selections of campanulas, irises, pæonies, and liliums. From Messrs. T. S. Ware, Lim., Feltham, there also came a brave show of hardy flowers, delphiniums and pæonies being the most attractive features. Long-spurred aquilegias, showing a fine range of colour, but with rather small flowers as staged on this occasion, were largely shown by Messrs. Bakers, Wolverhampton. Pansies and violas, representing the finest show varieties, were exhibited by Messrs. Dobbie and Co., Rothesay, who, in addition, had some good sweet peas, their Sun-proof Crimson and the lavender-coloured Ivanhoe each securing an Award of Merit. Turner's Pink Rambler, a rosy pink counterpart of Crimson Rambler, very free, was shown by Mr. Charles Turner, Slough; carnations from the same firm included Lady Desborough, white rose flaked; and Jocelyn, a deep heliotrope border variety.

Mr. A. Allan, gardener to Lord Hillingdon, Uxbridge, put up a large group of well-grown plants of Carnation Nell Gwynne, all well flowered, and the Bronze Flora medal seemed scarcely an adequate award. Mr. T. Waller, gardener to A. C. Hammersley, Esq., Bourne End, Bucks, exhibited a group of the rich yellow Cecilia carnation, the blooms of large size and showing this useful variety at its best. Messrs. Stuart Low and Co., Enfield, displayed Malmaison and perpetual carnations largely, again showing their new Malmaison variety Sunrise, pale buff and pink.

Mr. G. Reuthe's group of hardy flowers contained many interesting things, notably the ixias, pæonies, and irises, but the flowers were all overcrowded. Mr. F. Bouskell, Market Bosworth, Nuneaton, who has been at work improving verbascums for several years, showed the results of a large number of crosses; Ivanhoe, coppery yellow; Caledonia, buff-pink; and A. M. Burnie, pink, were a few of the finer forms displayed. Among the roses shown by Messrs. Frank Cant and Sons, Colchester, there were beautiful bunches of Richmond, Mdme. Abel Chatenay, the single white Una, Mrs. Peter Blair, and Hugh Dickson.

Iris albo-purpurea Colchesterense (A.M.), blue and white, was the feature of a small display of irises, liliums, and ixias from Messrs. R. Wallace and Co., Colchester. In the group of sweet peas from Messrs. G. Stark and Son, Great Ryburgh, Norfolk, good things were Maggie Stark, George Stark Improved, Mrs. Duncan, Aurora Spencer, and Olive Ruffel. Mr. C. Blick, Hayes, had a lovely lot of border carnations, yellow ground fancies being especially well represented by Big Ben, Nicon, Merlin, Pasquin, Nureddin, Jason, Mandarin, Dauntless, Constantine, Linkman, etc.

Sir Albert Rollit, St. Annes, Chertsey, sent up a dozen vases of grand spikes of Lilium umbellatum, a fine lily. The roses from Messrs. William Paul and Son, Waltham Cross, included such lovely varieties of their own raising as Margaret, Portia, Refulgence, Warrior, Bianca, and Alice Cory Wright; the bedding China rose Charlotte Klemm is of splendid colour, and was well shown. Messrs. Kelway and Son, Langport, had a good selection of pæonies and delphiniums, and among the latter their Purple Velvet (A.M.), with large single purple-blue flowers, was conspicuously fine; Queen Mother, True Blue, and Athos were other very handsome varieties. Messrs. R. H. Bath, Wisbech, were also large exhibitors of pæonies.

Mr. W. Smith, gardener to A. Ferguson, Esq., The Hollies, Weybridge, had a large group of seedling delphiniums, in many of which the general colour was blue or purple and the centre white; in others, of a cream or buff colour, the centre was brown or nearly black; Avalanche is a good white. Other contributors of hardy flowers were Messrs. G. Jackman and Son, Woking; and Messrs. Wiliam Bull and Sons, Chelsea.

ORCHID COMMITTEE.

Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, brought up the handsome Cattleya Mossiæ Michael and the white C. M. Bansha. Mr. G. Day, gardener to H. S. Goodson, Esq., Putney, showed the old, rare, and blue-tipped Dendrobium Williamsianum, Lælio-cattleya Radiancy, and Odontoglossum Armainvilliersense. Mr. H. A. Tracy, Twickenham, showed the prettily-spotted Odontoglossum Eleanor (cirrhosum and Uro-Skinneri), and Lælio-cattleya eximia magnifica. Some lovely odontoglossums were again brought over by M. Mertens, Loochristy, Ghent. Messrs. J. and A. McBean showed some fine forms of Cattleya Mossiæ. A strong plant of Cattleya Warscewiczi, carrying a magnificent spike of six beautiful flowers, was sent by Mr. James Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

Acineta Humboldti, with two pendant spikes of curious flowers, was a prominent feature in the group of orchids set up by Messrs. Stuart Low and Co., Enfield; other notable plants were Oncidium macranthum, Renanthera Imschooteana, Cœlogyne Dayana, Oncidium Lanceanum, O. pulchellum, Dendrobium secundum, and Cypripedium niveum. Messrs. Charlesworth and Co., Haywards Heath, had a pretty group of orchids, in which Bulbophyllum virescens, with a pendulous umbel of large spidery green flowers, was conspicuous; Lælio-cattleya Canhamiana alba, Odontioda Charlesworthi, Zygocolax Charlesworthi, Miltonia Hyeana, and odontoglossums.

Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking, brought up a fine plant of Odontoglossum Vuylstekei with two spikes of large flowers (Cultural Commendation), and Odontioda heatonense var. St. Vincent, with rosy and white flowers. Mr. Alexander, orchid grower to Sir G. Holford, Westonbirt, Gloucester, showed a fine plant of Lælia tenebrosa Walton Grange var.

FRUIT COMMITTEE.

Messrs. Laxton Brothers submitted fruits of Bedford Champion, Utility, Rival, and Profit strawberries, and evidently all were good because scarcely a fruit remained soon after the committee rose. A new strawberry named Mark Twain from Mr. F. B. White, Donovan Cottages, Old Netley, gained an A.M.; it is an early variety, said to ripen a week before Royal Sovereign.

Peaches, nectarines, and figs in pots, all carrying fine crops of fruit, were shown by Messrs. James Veitch and Sons, Chelsea, the fan-trained example of Duke of York peach carried a fine crop of ripe fruit. Splendidly-fruited cherry trees in pots, from Messrs. G. Bunyard and Co., Maidstone, were greatly admired; Florence, Margaret's, Guigne d'Annonay, Elton Heart, and Montreuse de Mezel were particularly well cropped.

AWARDS OF MERIT.

To Delphinium Purple Velvet, from Messrs. Kelway and Son, Langport; to Iris fulvata, from Mr. W. R. Dykes, Charterhouse, Godalming; to Kalanchoe Kewensis Excelsior, from Messrs. James Veitch and Sons, Chelsea; to Sweet Peas Sunproof Crimson and Ivanhoe, from Messrs. Dobbie and Co., Edinburgh; to Iris albo-purpurea var. Colchesterense, from Messrs. R. Wallace and Co., Colchester; to Delphinium Theodora, from G. Ferguson, Esq., The Hollies, Weybridge (gardener Mr. F. W. Smith); to H.T. Rose Freda, from Messrs. Paul and Son, Cheshunt; to Strawberry Mark Twain, from Mr. F. B. White, Old Netley; to Odontioda Vuylestekei Walton Grange var., from Mr. Thompson, Walton Grange, Stone, Staffs.

MEDALS.

Silver Gilt Flora.—Messrs. R. H. Bath, Wisbech, for pæonies; Messrs. D. Prior and Son, Colchester, for roses; Mr. L. R. Russell, Richmond, for stove plants.

Silver Knightian.—Messrs. James Veitch and Sons, Chelsea, for fruit trees in pots; Messrs. G. Bunyard and Co., Maidstone, for fruit trees in pots.

Silver Gilt Banksian.—Messrs. Frank Cant and Co., Colchester, for roses; Mr. Amos Perry, Enfield, for hardy flowers.

Silver Flora.—Mr. C. Blick, Hayes, for carnations; Messrs. Paul and Son, Cheshunt, for pæonies; Mr. G. Ferguson, Weybridge, for delphiniums; Messrs. James Veitch and Sons, for hardy and greenhouse flowers; Messrs. S. Low and Co., Enfield, for orchids; Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Banksian.—Mr. J. Box, Lindfield, for hardy flowers; Mr. H. Burnett, Guernsey, for carnations; Messrs. B. R. Cant and Sons, Colchester, for roses; Mr. A. C. Hammersley, Bourne End, for carnations; Messrs. S. Low and Co., Enfield, for carnations; Messrs. H. B. May and Son, Edmonton, for ferns; Messrs. W. Paul and Son, Waltham Cross, for roses; Mr. G. Reuthe, Keston, for hardy flowers.

Bronze Flora.—Messrs. Kelway and Son, Langport, for delphiniums and pæonies; Messrs. W. Cutbush and Son, Highgate, for hardy flowers; Mr. R. C. Notcutt, Woodbridge, for hardy flowers; Messrs. G. Stark and Son, Great Ryburgh, for sweet peas; Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; Lord Hillingdon (gardener, Mr. A. Allan), for carnations; and the Misses Hopkins, Shepperton, for alpines, etc.

RHODODENDRON VICTORIANUM.

On page 433 of the Gardeners' Magazine "K" refers to Rhododendron Victorianum as a garden plant. Those who do not know the variety should not plant it out in the open garden unless they have a quantity, and do not mind risking a plant or two in order to secure acclimatisation if possible. We cannot grow it here, as the first frost kills it. Perhaps there are some spots where it can be grown out of doors; indeed, I have seen R. Dalhousei growing well near Falmouth, Penzance, and Penryn, but I have not seen it further north; we have tried it and failed. Another R. Nuttalli cross has failed to do well, i.e., Countess of Haddington. This has succumbed during the present spring, and probably the wet autumn and early frosts were answerable for its death. Yet in April, when I was in the west, this plant was really one of the best, if not absolutely the best, out of doors.

Rhododendron Victorianum is an ideal plant for a cold greenhouse, and our plants under such treatment have bloomed well; in fact, they always do, and the temperature of the house is only kept just above freezing-point in cold weather. R. Victorianum appears to me to want exactly the same treatment as R. Edgworthi. We have here, however, several Edgworthi crosses that have stood the winter on high ground.

"K." also mentions R. Pink Pearl, and the fact that it has stood 10 degrees of frost unharmed; this beautiful variety does very well with us, and never has any protection, nor does it appear to want any. Several of the hybrids from R. Aucklandi do equally well without any protection, and the pure white Aucklandi stands out of doors unharmed. R. Mrs. James Shaw and R. Countess of Sefton and others of this type, simply survive, and that is all that can be said for them, as we get but little bloom and the plants are generally badly crippled by the early autumn frosts in October.

W. A. Cook.

Leonardslee Gardens.

Celery.—The note on celery planting by Mr. G. Ellwood, Swanmore Park Gardens, which appeared on page 434 ("G.M." of June 4), contains some useful hints. I am glad he advocates very shallow trenches where heavy soils obtain, and only moderately deep ones in the case of lighter soils. By some cultivators it is considered to be unorthodox to plant celery on the level, or nearly level, ground. I at one time had to deal with a cold, clayey soil, and all my celery plants for exhibition were grown on the level, staked, fed, and earthed up in due season. Then I had to deal with a light rooting medium, and in this case nearly two thousand plants were annually grown, and were entirely satisfactory. I never followed orthodox systems in the cultivation of any kind of plant if I could find a better way, and I am sure that many young inexperienced gardeners do follow them, to their own disadvantage, especially in the case of trenches for celery. Too often we forget to grow our celery in the best portion of the soil—the top. —George Garner.

SPIRÆA ARUNCUS.

One of the finest of herbaceous perennials is the Goat's Beard Spiræa, S. aruncus, a species found widely distributed throughout the Northern Hemisphere, and one that grows to a height of about four or five feet when in a suitable position. The common, strong-growing form is sometimes grown on the rock garden, where it is entirely out of place, and usually suffers considerably. Where there is a combination of rock and water gardening, a suitably moist position and deep soil may often be found for this fine plant, but it is always seen at its best when grown as a lawn specimen, filling a large bed in the pleasure grounds, or creating a picture of foliar elegance and floral grace near water. S. aruncus has accommodated itself to its environment in many parts of the northern half of the world, and in Japan, on the hills, there is a varietal form that rarely exceeds a foot in height; this would, of course, be quite suitable for the rock garden.

In water garden scenery and in woodlands, where there are sheltered and broad-margined walks, Spiræa aruncus is extremely useful and beautiful. It must not be planted in water, nor does it succeed in deep shade; but a moist position and shelter from driving winds it greatly appreciates. Deep rich soil, such as is usually provided for flower beds and herbaceous borders, suits S. aruncus finely, and if the strong growths are sufficiently supported to prevent damage from wind and rain, then the plant amply repays any attention that has been given it by producing great compound panicles of whitish flowers during June and July, the beauty of each inflorescence being greatly enhanced by the semi-pendulous habit of the little spikes that go to make up the panicle. In dry seasons, or on poor soil, S. aruncus should be encouraged by a mulching of manure towards the end of May, and supplies of water or liquid manure previous to and also after the mulching. Careful division of the root masses either in September or in early spring just as new growth commences offers a ready means of increasing stock.

A FINE EXAMPLE OF SPIRÆA ARUNCUS IN AN IRISH GARDEN.

GOLD MEDAL ROSES.

It was in 1883 that the first gold medal of the National Rose Society was awarded, and it was most appropriately granted to Her Majesty, named after Queen Victoria, the first patroness of the society. Since 1883 we have had no fewer than sixty-eight seedlings or sports which have gained this most coveted distinction. We had no gold medal rose in 1884, 1886, and 1888, the intervening years supplying one variety only; but from 1889 up to the present there have been no seasons without gold medal winners, while in 1908 and 1909 we had nine winners each year.

To gain this medal a variety must, or should be, exceedingly good, seeing it is expected to be an advance upon existing varieties and quite distinct. But I wish to call attention to a few of the earlier winners that one can scarcely consider useful or everyday roses. It even seems hard to believe they ever gained such an honour, and those I will name do not recommend themselves to me as roses for general cultivation. Take Edith D'Ombrain, a winner in 1901, for instance; I do not believe any grower will say this is a rose worthy of such a distinction as the N.R.S. Gold Medal. Messrs. B. R. Cant and Sons, also Messrs. Paul and Son, Messrs. W. Paul and Son, and Messrs. Frank Cant and Co. do not even catalogue it in last season's lists, and the lists of these noted growers are very complete. With myself Edith D'Ombrain has been a most disappointing rose, and I cannot say a word in its favour. It is useless except for an occasional show flower, and such are few and very far between. Mildew affects it, the growth is squatty, and the flower is a dirty blush-white.

The three Marchionesses, of Dufferin, Downshire, and Londonderry, are far from being useful roses. Salamander, Mrs. Cocker, and Alice Lindsell are uncertain, while good as Ulster and Mildred Grant are for exhibition, they do not commend themselves to me as useful varieties except for that one purpose.

I am far from wishing to disparage our Gold Medal awards, because the flowers exhibited were undoubtedly good, but the varieties have not turned out so useful as we might reasonably have expected, and I am pleased to note there is now a tendency to hold the medal from anything not quite first class. The addition of a silver-gilt medal, to fill in the wide gap between the premier award and a card of commendation is a happy thought. There was such a wide margin between the two until this new regulation, which comes into force during the present year.

But when we come to such sterling varieties as Mrs. John Laing, Mrs. R. G. Sharman Crawford, Lady Roberts, Mrs. B. R. Cant, Mrs. Edward Mawley (rather tender), Mrs. W. J. Grant, Souvenir de S. A. Prince, Hugh Dickson, Dean Hole, Betty, J. B. Clark, Irish Elegance, William Shean, G. C. Waud, Blush and Crimson Ramblers, with White Dorothy, we find varieties well worthy of the highest awards; and these are only a few of the best that occur to me as I write.

A. Piper.

For pretty gardens and lovely flowers read The Flower Garden by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted [illegible]. Price 7s. 6d. net, by post [illegible] W. H. and L. Collingridge, 148 and 149 Aldersgate Street, London.

AROUND KING GEORGE'S HIGHLAND HOME.

Twice in the year a glory comes over Royal Deeside—the district in which is situated Balmoral Castle, his Majesty's Highland home—which no lover of nature should ever miss beholding. By far the best of these revelations of beauty is the early one, when in late May and early June old Dame Nature decks herself in exquisite jewellery. The chief part of the display depends on the bursting of the leaf buds of deciduous trees, but account must not be lost of the springing of the emerald grass and the flowering of the golden furze bushes that line the hill slopes and the wastes. Even the bare brown fallows where the husbandman is preparing for his season's work add hues and foregrounds rich in tone and contrast. The black-green Scots pines have stood there all the winter in their sombre hues, getting darker if anything, and when the tender yellow-greens of the budding larch come gradually out, they are shown up against a deep setting, especially when the sunlight falls upon them. It is this delicate green of the larch that is the special feature of the spring on Deeside, and at no season of the year is there the same beauty and charm, for the early colours exposed to air and sunlight soon lose their freshness, and tone down to shades that lack the finer loveliness of their first blush. Whatever may be the coign of vantage you take, you see such variety of colour, such blending of shade, and such freshness pervading all as can only be matched at the re-birth of nature, and not always then, for circumstances seem at times, as in the present year, to combine for the production of a perfection within a perfection.

At the base of the scale we have the spruces and firs, their pale green tips contrasting strongly with the dark green of the older part of their branches, and between these and the hesitating hues of the larch there come the brownish greens of the opening birch, a tree well named the "Queen of the Woods." In every season this tree is singular in its grace and bearing. Even when stripped of its scented leaves, the white bark, the slender stem, and supple twigs attract attention the first of any forest growth. But when, as I write, the buds swell to bursting, and the amber tones of the nascent foliage mingles with the dark brown bark of the spray and the silvery white of the bole, you have a picture of unsurpassed loveliness. There are other constituents of the foliar display almost as remarkable as those, were they but the golden-leaved poplars and the "white blown" willows. Nor is there wanting flowers as well as leaf. The maples already hang their yellow-green blossoms from the bough tip, and the snow-white bride's veil of the gean is flung over her head and form.

In the woods I noticed the blossom on the blaeberry bushes—a promise of food for the birds by and bye. And then the woods seem overrun with baby rabbits. Although considered a nuisance by many, one cannot help admiring the little mites as they look at you for a moment, and then scurry off in a panic. All this may be viewed at the present time, and yet closer observation shows that myriads of leaf forms are still coming into being in dense and beauteous array. The blackthorn has yet to put on the fullness of its whiteness, and the rowan and the apple and the chestnut and many more will follow ere the tardy leaves of the oak and the ash, contending between shower and dust, decide whether during the next few months the land will "smoke or soak."

Over all this beautiful picture is the natural pleasure of the inhabitants of this charming country to know that King George and Queen Mary have a strong liking for Balmoral. The castle and grounds are now being renovated by tradesmen and gardeners, and at the present rate of progress the castle will be ready for occupation by the middle of next month, when the Queen and the Royal children are expected. It is expected King George will follow early in August, about the "Twelfth." Indeed, there is the prospect of a visit extending over two months on the part of the King, and to an even longer period by Queen Mary and the Royal children. Queen Alexandra, too, is also expected on Deeside in due course, the impression being that her Majesty will be the guest of her eldest daughter the Princess Royal and the Duke of Fife at Mar Castle, if not resident at Balmoral Castle. W. K.

IRISES BY THE WATERSIDE.

One so often hears the term "waterside irises" mentioned in connection with water gardening that it would seem impossible for one to further emphasise the value and charm of these interesting plants. To my mind we have erred only in that we have not utilised more irises in the embellishment of our pools and watercourses.

The Japanese irises, varieties of I. Kæmpferi and I. lævigata, have certainly attained to a well-deserved pre-eminence as waterside subjects, and greatly though they are esteemed, I would urge a wider appreciation of these most lovely flowers. I do not, however, wish to dwell upon I. Kæmpferi, but to take up a broader outlook, and, incidentally, mention various other irises of note. We might utilise those charming American irises, the versicolor group, for the purpose in hand.

A notable object-lesson has been afforded here by planting varietal forms above and below the water line, with the result that the plants with the roots submerged are stronger, healthier, and freer in bloom. Of this group one may note the type, a rich claret-purple shading to crimson; I. virginica, a fine purple veined with white; I. kermesina, a crimson-red, passing to white at the base of the falls; the lovely I. Hansoni, with its pale mauve standards, and lilac falls waved with white and gold; I. Fosteri, a sterling lilac and purple form, with well-defined lines of yellow and white; and the delightful I. China Blue, a clear soft shade of blue, exquisitely marked with white and gold.

The charming irises of the I. siberica group are grand in the marshy margins by the pools, and assist to fringe a stream in a free, informal manner. The light grassy foliage, and hosts of daintily coloured blossoms, have a peculiar charm for all lovers of this class of plant. One cannot grow all the forms in an average garden, and therefore should confine ourselves to the finest varieties. Of these I especially commend I. orientalis (or sanguinea), a splendid large-flowered violet form; I. Blue King, a fine rich blue of decided merit; I. Snow Queen, a grand snowy white; I. major, a pretty combination of a deep blue and violet; I. Baxteri, a study in blue and white; I. Lady Godiva, white, with pinkish tinge; and the useful I. alba grandiflora, a good white form.

Iris setosa invariably does well near the water, giving very good results in the moist margins, where the purple, white-veined blossoms show to advantage. I. missouriensis, again, may be called into service. Just above the water line this iris grows splendidly, and its delicate colourings look very charming en masse. The noteworthy Chinese I. Delavayi is like the Japanese irises, quite at home in abundant moisture, a habit it shares with the lesser-known Japanese species, I. albo-purpurea, and its varietal form, I. cærulea. There seems a certain affinity about these three, and they blend well together with their shades of blue, purple, and white.

I. aurea, with its strong free growth and showy golden-yellow blossoms is widely grown, and there are few plants better for waterside furnishing. Of its varietal form I. intermedia, a paler, free-growing yellow, I can speak with praise, for it is quite as worthy as its parent. I. Monnieri, a bright clear yellow, very free, and of good appearance, is very effective, and in conjunction with such irises as I. aurea, I. spuria, etc., it has given rise to many fine hybrid varieties. I. monaurea, for instance, is a grand yellow, while the typical Monspur, raised by the late Sir Michael Foster, gives much of the blue colouring of spuria, with the height and vigour of I. Monnieri.

The grand, stately Iris orientalis (or, to give it the more popular garden name, I. ochraleuca) is one of the most notable irises in existence. For freedom and vigour it is unsurpassed, and the large white and yellow blossoms show to great advantage. Its varietal forms include the robust gigantea, Snowflake, a purer white than its parent, marked only with golden spots, and the exquisitely colour sulphurea, a pleasing pale sulphur-yellow.

I. pseud-acorus, the well-known native, is not so free as many of the foregoing, although the growth is so strong. It is worth planting if plenty of space is available, but is surpassed in beauty by its varieties, Bastardi, a pale primrose gem; albus, the rare creamy-white form; and variegata, with its white-lined foliage.

With regard to the irises of the spuria group, I may briefly suggest that they should be included for their shades of blue. They are charming companions for aurea, Monnieri, etc., and contrast beautifully. In addition to the well-known type, one would note A. W. Tait, a good lavender; Celestial, a fine pleasing shade of blue; cærulea, a bright clear blue; Notha, a rich violet; and the sterling white form alba. While there are other irises of note which do well just above the water line, the foregoing will doubtless prove sufficient for the greater number of gardens. For the majority the oft-repeated advice of "sunshine above, moisture below," will be sufficient for a planting guide, as far as the situation is concerned.

As for soil, they revel in a good fibrous loamy medium, to which is added a fair amount of decayed manure. Irises pay for moderate feeding, and on that account should not be planted in impoverished land without manure.

The time of planting is an open question, but, in my opinion, the majority of irises transplant well almost directly after flowering. Having attained their full season's top growth, they can devote their energies to establishing themselves in the new positions before the advent of the winter season.

The past few years have witnessed such developments in the "cult of the iris" that few gardens are now complete without them.

In the making of garden pictures they are superb, particularly the waterside forms. Mark, if you will, the charms of the Japanese irises rising on either side of the stepping stones, or a serried outline of them with a background of light reeds or bamboos. Picture if you will a great swamp bed of irises alone, wherein a myriad hues and shadings form one of the most complete floral harmonies imaginable. A garden of irises is a garden of delight, a source of perennial interest, in spite of the fleeting beauty of the blossoms.

The late Sir Michael Foster typified the interest and charm in his garden at Shelford, and the Japanese gardens at Horikiri, Yoshino-en, and Kabati are noteworthy as showing the Far Eastern appreciation of irises. P. S. Hayward.

NOTES FROM KEW.

Escallonia langleyensis.

Two beds of this hybrid escallonia at the back of the Palm House serve to show that it is one of the most beautiful, as well as one of the hardiest, of the genus. It was raised at Langley from E. Philippiana fertilised with the pollen of E. macrantha. In habit E. langleyensis partakes a good deal of the character of E. Philippiana, the spreading branches, which arch over in an exceedingly pleasing and graceful manner, being furnished throughout the greater part of their length with charming bright rose-pink coloured blossoms. Its season of blooming is somewhat earlier that E. Philippiana, as this last-named is only just unfolding its earliest flowers. On June 15, 1897, an Award of Merit was given to E. langleyensis, but I venture to think if one of the beds at Kew could be put before the Floral Committee that a First Class Certificate would, without hesitation, be awarded it.

Cratægus oxyacantha Gireoudi.

As a rule, variegated-leaved thorns are not particularly desirable, but this is a decided exception. The variegation is so bright that at a little distance the bush appears to be laden with blossom. The colouring is principally confined to the young growths, which are at the base white, or nearly so, becoming flushed with pink toward the upper part, while the extreme tip is bright red. The old leaves are for the most part deep green, interspersed with a few variegated ones, so against such a background the lighter tints are especially conspicuous.

Robinia Kelseyi.

Near the birch collection there is a good flowering example of this new robinia, which was given an Award of Merit on June 7th this year. Like the Rose Acacia (Robinia hispida), it flowers freely in a quite small state. The general aspect of the plant is light and pleasing, the leaflets being narrow. The flowers, borne in drooping racemes, are of a deep mauve-pink colour. This robinia, which is a native of North America, was introduced in 1901, but must still be regarded as decidedly uncommon.

Buddleia globosa.

Despite the number of new buddleias that have been introduced within the past few years, there is no danger of confounding this (one of the oldest species) with any of them, the orange-coloured balls being so distinct from anything else. What is more, its native country is just as widely removed, for it comes from Chili and Peru, whereas all the others are natives of the Eastern portion of Asia.

Hydrangea petiolaris.

This vigorous growing climbing hydrangea is just the thing for clothing a rough bank or similar position. A large mass of it rambling over some old tree roots near the Pagoda is at the present time very attractive, being plentifully sprinkled with clusters of blossoms. It is also known as Hydrangea volubilis, owing to its climbing habit, and for clothing a north wall it is very desirable.

Diostea juncea.

Although not showy, this is a pretty and interesting shrub. A singular feature is that, though a member of the verbena family, it mimics one of the spare-growing brooms, such as Genista æthnensis. It forms a specimen about ten feet high, and though the main branches are ascending the minor branchlets are slender, more or less drooping, and clothed with green bark. The leaves, which are arranged in pairs, are generally less than an inch long, ovate oblong in shape, and but sparingly produced. The individual flowers are less than half an inch long, tubular in shape, and of a pale lilac tint. They are disposed in small, but thickly crowded spikes, and borne plentifully. This diostea is a native of the Andes, of the Argentine and Chilian region, where it occurs at an elevation of 3,000 to 5,000 feet. It is one of the subjects alluded to by Mr. Beckett in his article on "Some Beautiful Shrubs," published in the last issue of the "Journal" of the Royal Horticultural Society.

K.

AMONG THE WILD FLOWERS

Who can describe that peculiar pleasure one experiences whenever a plant familiar enough in gardens is met with in some corner of Nature's garden, where, untended and undisturbed, it flourishes and fulfils its mission according to the great scheme of creation? Why is it that the foxglove in the lane, or the lythrum by the brook, appeals to one more forcibly even than when grown to greater perfection in the home garden? The fact that they occupy the spot Nature intended them to is surely the reason.

It is, moreover, not only a pleasure, but an education, to meet many of our favourite flowers in their native homes, and this I realised, as I have often done before, when recently I spent several enjoyable days among the mountains and valleys of North Wales. The district I visited is in Denbighshire, between Wrexham and Llangollen, easy of access, especially from Liverpool or Chester, from whence it is well served by what was formerly known as the Wrexham, Mold, and Connah's Quay Railway, which is now a branch of the Great Central Railway Company. Even from London the journey is easily accomplished, through trains being run as far as Wrexham. With the village of Coed Poeth as a starting point, one may reach the foot of the Minera Mountain within the space of half an hour, and scarcely has ascent been commenced when it becomes evident that this mountain is a veritable botanist's paradise.

It was in the first week in June that I climbed Minera, and one of the first things that caught my eye was Ornithogalum nutans, growing in broad masses under the shade of low-growing bushes. Prettily intermingling were the spikes of Galeobdolon luteum, and an abundance of bluebells, Alchemilla vulgaris, and A. alpina were both about to flower, the former being more plentiful on the lower slopes and beside a trickling streamlet, where I also saw plenty of Ajuga reptans and A. alpina, the latter being considered somewhat rare in Britain. The moist, but rocky banks of this same stream provided an ideal home for many beautiful ferns, among which the lovely little Filmy Fern, Hymenophyllum Tunbridgense, was apparently happy, having established itself, as is its wont, in just those crannies where moisture is never lacking and the light always subdued. Leaving the stream, and climbing a steep rocky slope, vegetation showed a marked change, and I came upon two or three sedums, cranesbills, Potentilla alpestris, with only here and there an open flower thus early. Many a species we are accustomed to plant on the sunny parts of the rockery grew here in the chinks and crevices of the great boulders of porous rock, and it was grand to look upward and around at the great mass of rock lying strata upon strata, here clothed with a mantle of verdure, there exposed and frowning, yet sheltering some tiny plant from wind and sun; and as I gazed, wrapped in admiration, I realised that I stood in a perfect garden, which the cleverest landscape gardener can but feebly and imperfectly copy.

Pushing ahead, sometimes with ease, sometimes scrambling on all fours, or pulling myself from one foothold to another, I reached a comparatively level sweep, where, in good fibrous peat, grew heather and whortleberries in utmost profusion. The Whortleberry (Vaccinium myrtillus) was in bloom, its globose bells of a reddish-purple colour being quaintly beautiful. Almost hidden beneath the heather were many fine plants of Blechnum spicant, which seemed to be about the only fern in this exposed area. From here the summit of the mountain was easily gained, and the view of the surrounding peaks, the intervening valleys, and the distant roads and villages was simply glorious. While enjoying the beauty of the scene I was startled by an unexpected clap of thunder, and, turning about, I saw a black cloud which seemed so low that it could scarcely avoid coming in contact with the mountain tops. From previous acquaintance with Minera I knew that some distance from where I stood were caves, and towards these I turned, just reaching them before the storm really broke, and under the shelter of my rocky retreat I watched an impressive spectacle, as lightning flashed and thunder rolled and echoed among the hills The entrance to the cave in which I sheltered was draped with scolopendriums, Asplenium trichomanes, A. septentrionale, and the Black Maidenhair Spleenwort (A. adiantum nigrum).

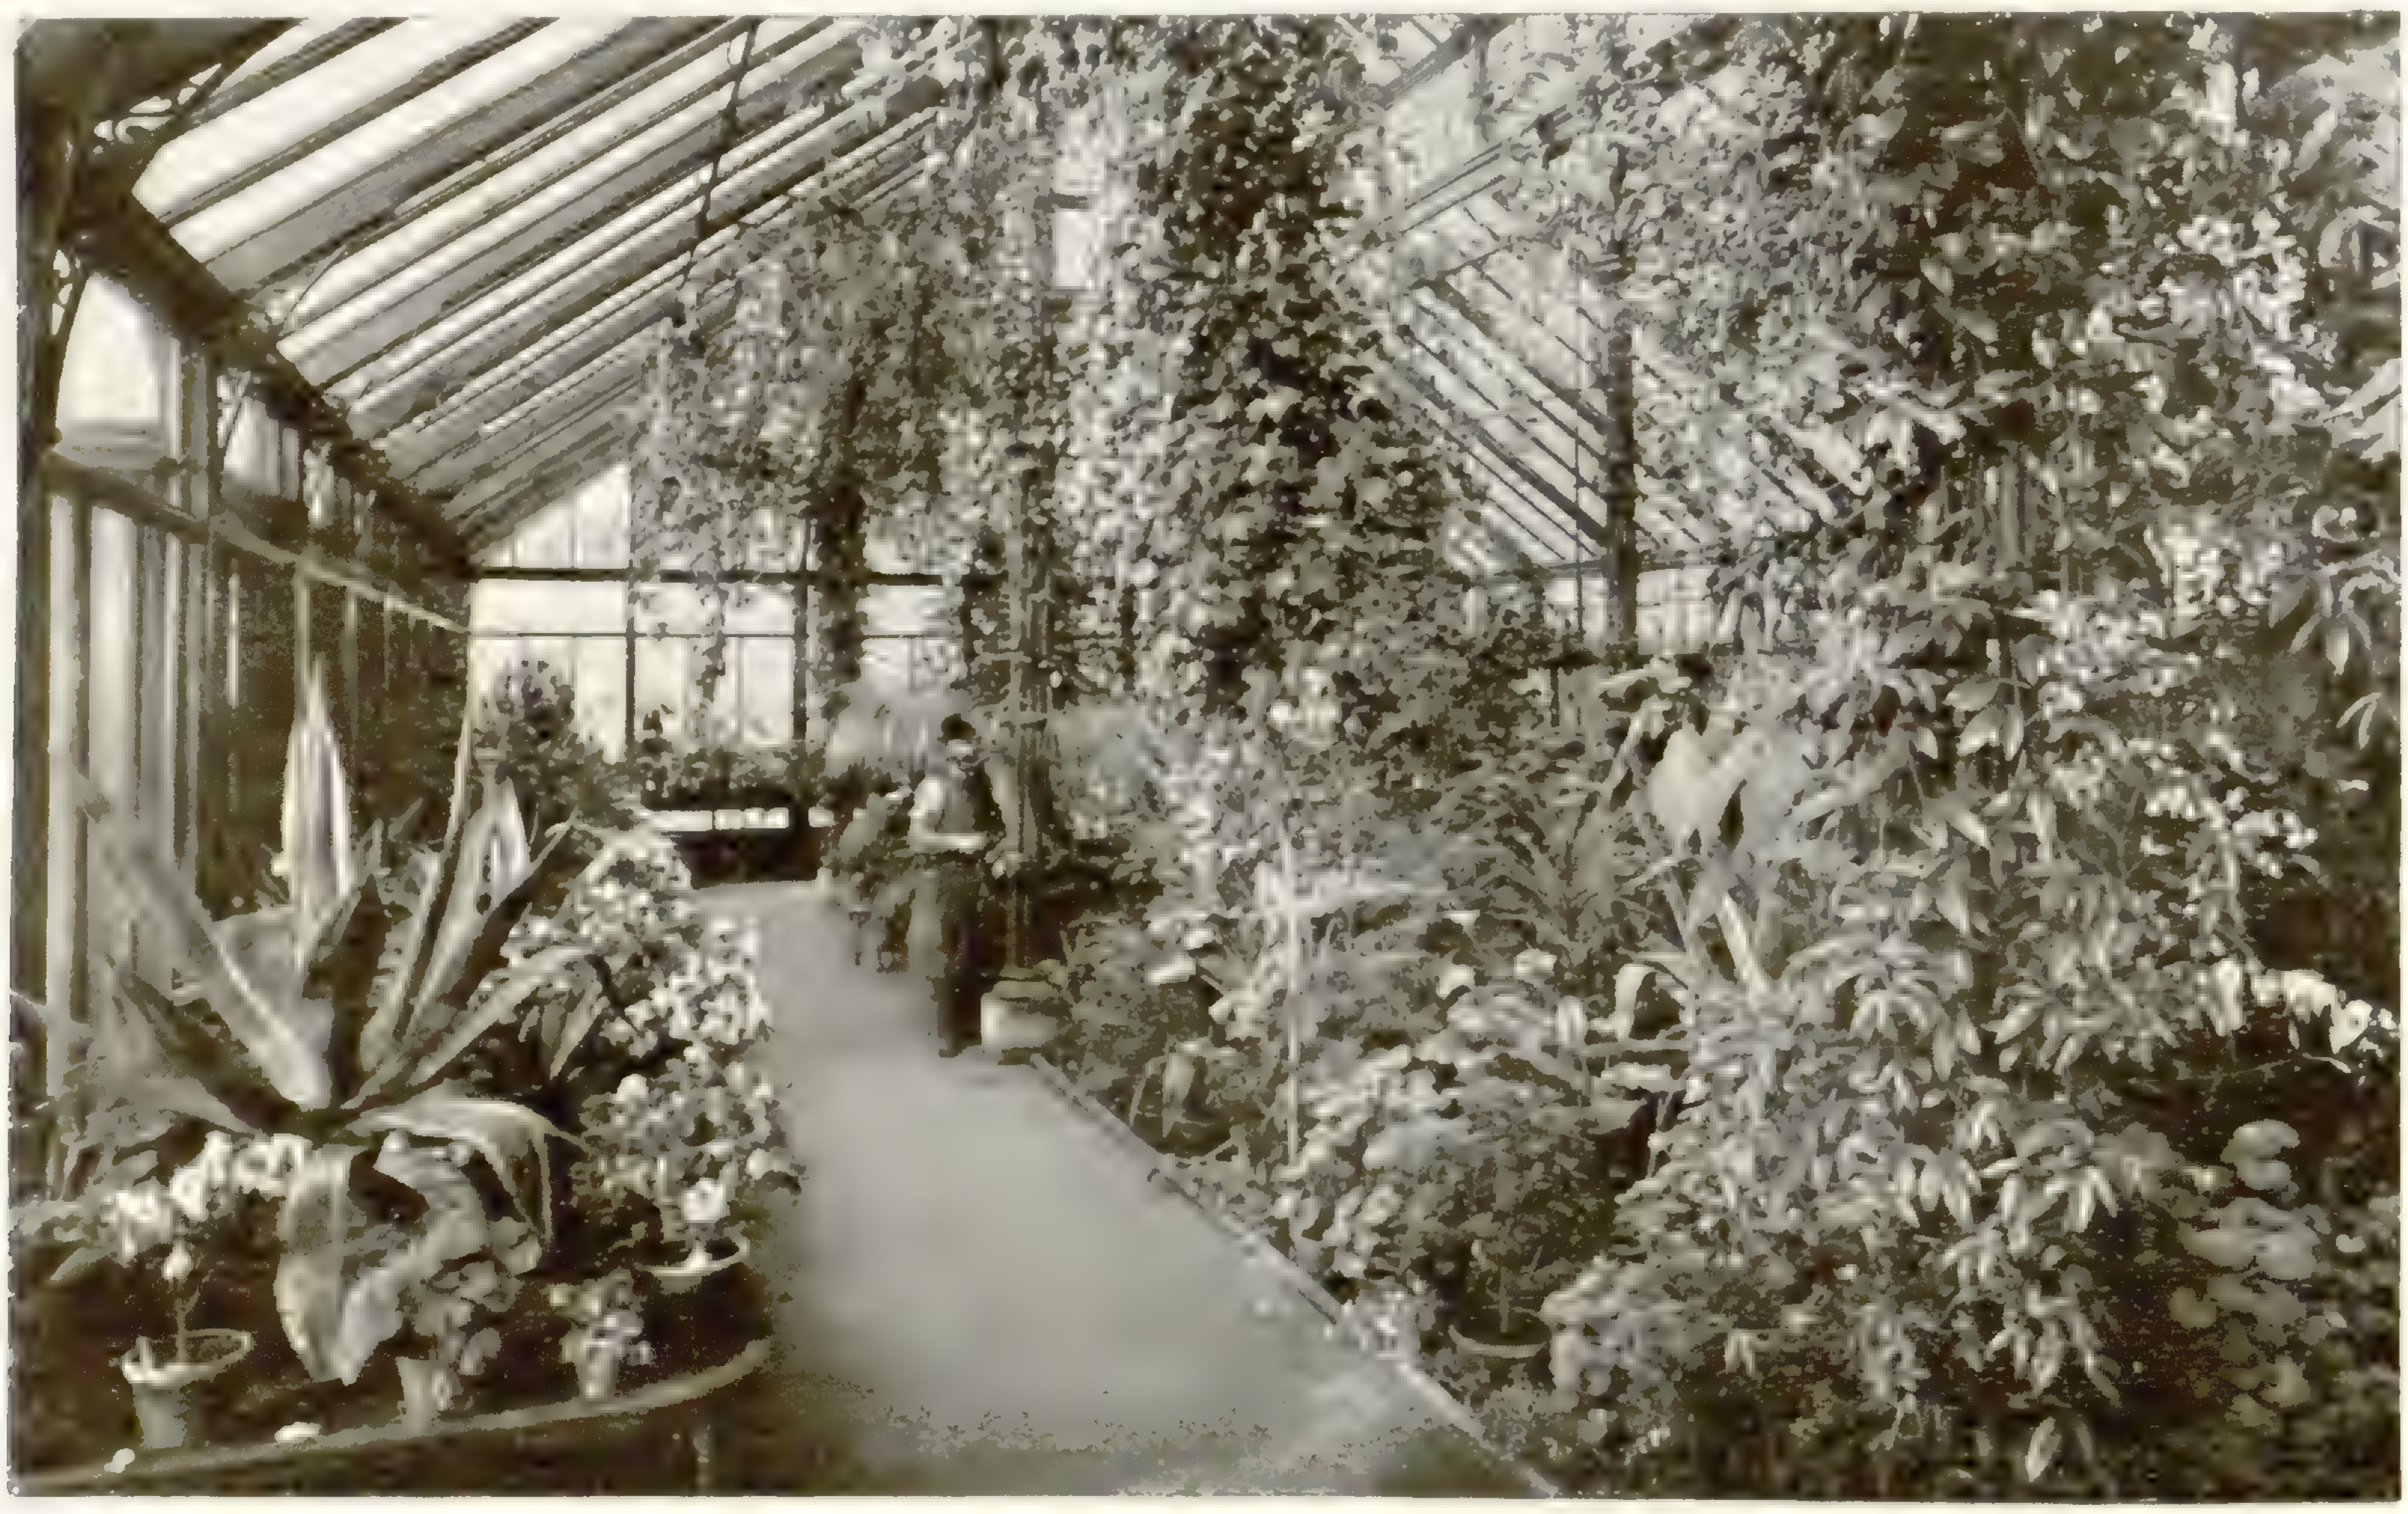
On the moist and shaded ground in front of the cave grew Orchis mascula, just passing out of bloom, and on the broken rocks scattered about were Thymus serphyllum, veronicas, and the pretty little Erodium moschatum. For hours I wandered alone and undisturbed among flowers of kinds too numerous to mention, for it seems that in one part or another the mountain provides conditions suitable for almost all the wildlings of our native flora, and not a few things that are but seldom recorded are here to be found. Strange it seems that so rich a storehouse of botanical treasures should apparently be but little known to students. Still, it is well the place should not become frequented by that class of hunters whose only pleasure seems to be the tearing up of every rarity they come across.

Were it not that my notes would be unduly long I would render a detailed account of other rambles through watery valleys, where calthas, myosotis, and equisetums grow; of the discovery of a mysterious subterranean passage that leads from the margin of a stream right into the heart of a great mountain, in the entrance of which filmy ferns grew like curtains of emerald lace, draping the water-washed rocks with wondrous beauty. Again, in woods and coppices, I found such things as Oxalis acetosella, Anemone nemorosa, Orchis bifolia, O. viridis, the lesser celandine, and Saxifraga granulata. Cardamine pratensis was plentiful in every swamp, as was also the ragged robin and red campion. In other parts great bushes of Cytisus scoparius were a mass of golden flowers. and the rarer Genista pilosa was also included among my "finds."

A. J. M

CONSERVATORIES.

For over two and a half centuries conservatories have occupied a prominent position among horticultural structures, and during this long period they have contributed liberally to the interest and the pleasures of the gardens in the British Isles, by giving suitable shelter to plants from climes with a higher temperature than our own, and affording opportunities for enjoying their varied charms independent of weather conditions. The conservatories that found favour about the middle of the seventeenth century were, it need hardly be said, very different in design and usefulness to those which form so distinct a feature of gardens at the present day. The earliest of these structures were little more than large rooms provided with windows along one side, that were of sufficient height to reach from the floor to the ceiling; and they had an open grate in which charcoal or other fuel was burnt during severe weather for the purpose of maintaining a temperature high enough to keep the inmates safe from frost. As they were mostly occupied by orange trees, and had but little radiating surface, a very moderate fire was, it may be assumed, sufficient for the purpose of excluding frost. The orange trees were usually taken out of doors as early in the season as it was safe to expose them to the weather, so the small amount of light that could find its way into these structures was not of so much importance as in the case of trees, shrubs, and other plants that are kept within doors throughout the year. The trees were at rest during the greater portion of the time they were within doors, and they had the advantage of full exposure to atmospheric conditions when completing their growth. With the orange trees were associated lemon trees and pomegranates, which thrived under much the same conditions.



INTERIOR OF A CONSERVATORY AT CRAGSIDE, ROTHBURY.
Erected for Lord Armstrong, by Messrs. Mackenzie and Moncur.

There are still many of these old orangeries in existence, but they are in gardens attached to the great ancestral homes whose history extends over several centuries, and in but few cases are they used for the accommodation of plants except, it may be, for sheltering specimen hydrangeas, fuchsias, African lilies, and other subjects that are now used with such excellent effect in beautifying terraces, promenades, and other prominent positions. The existence of so many of these dark, old-fashioned structures in ancient gardens is explained by the fact that for a long period after their introduction there were no great changes in the design. The later structures were more ornamental than those built at the time when Maria Henrietta had her orangery at Wimbledon, but there was no appreciable increase in the area of glass. In the best of those built in the eighteenth century the windows were a little larger, but as the full importance of light to plant life was not then understood, the roofs were made of opaque materials, and vertical light was excluded from the plants. Built with thick walls and stout timber, and the materials throughout of the best, these old conservatories have suffered comparatively little from the hand of time, and many owners of gardens in which they have a place have not unnaturally been reluctant to pull them down.

Change in Design.

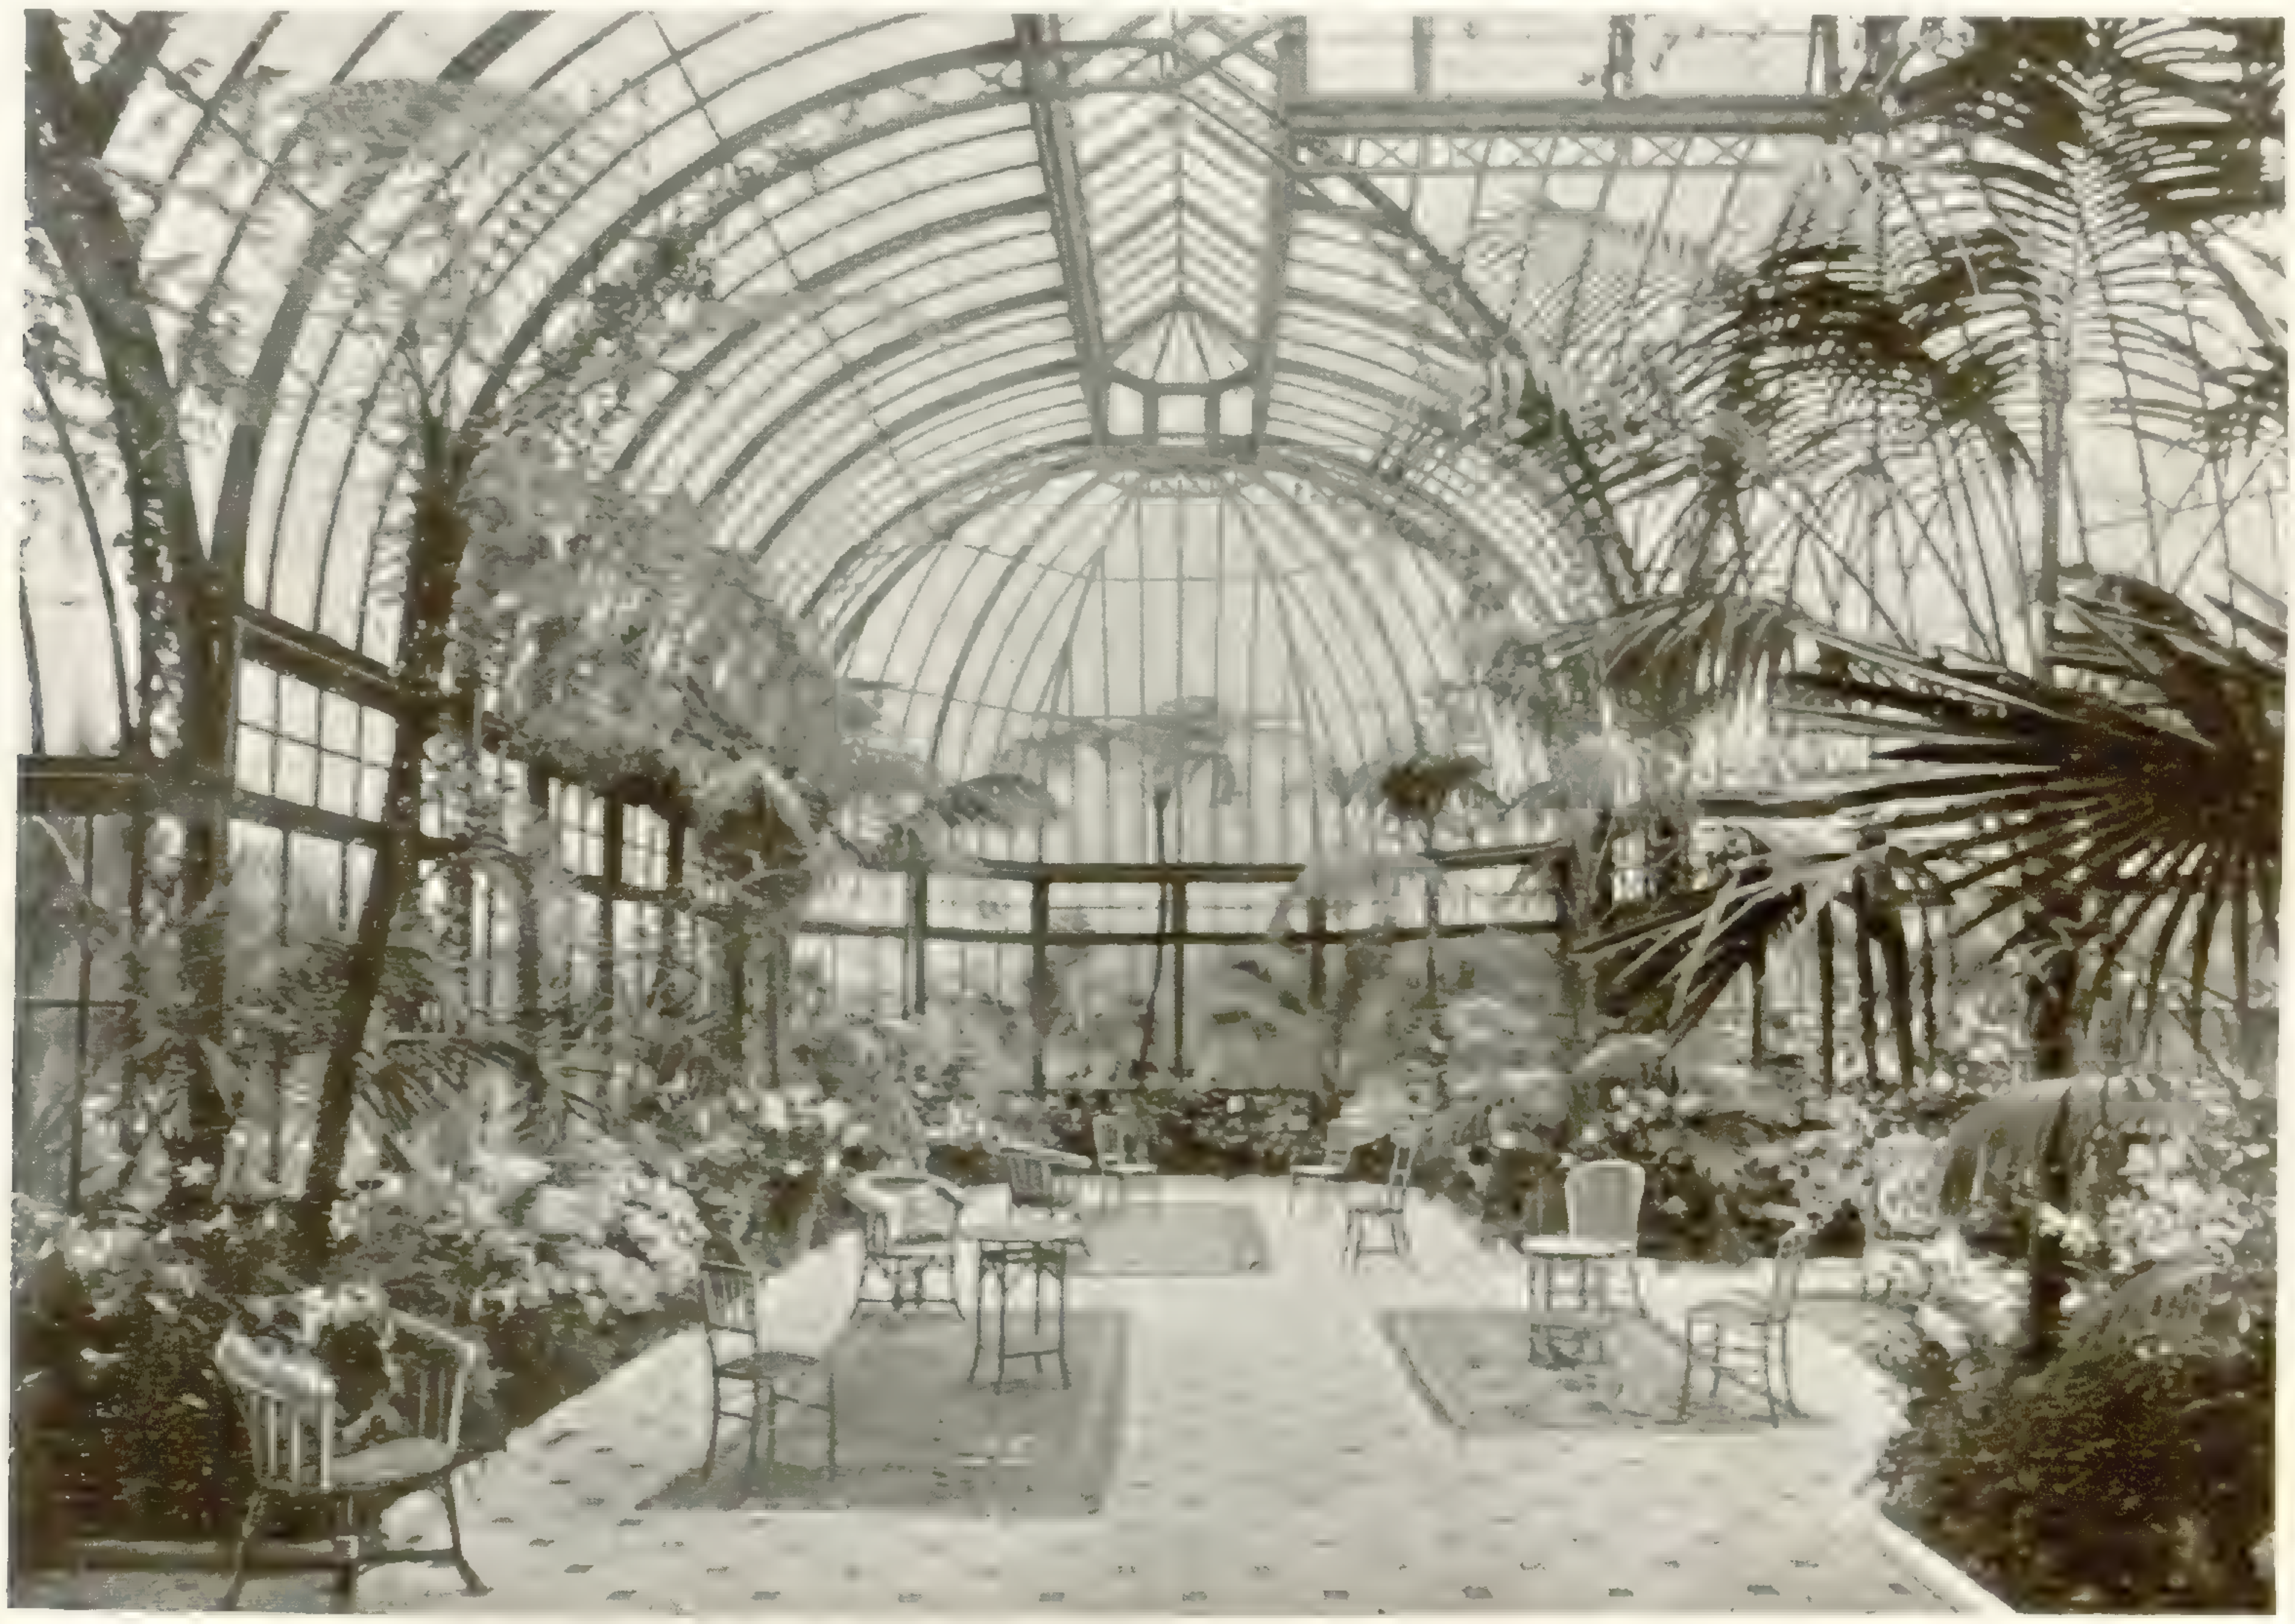
Since about the middle of the eighteenth century there has been a great and continuous change in conservatory design, and as the result of unremitting endeavour on the part of the leading horticultural builders, owners of gardens have now at their command conservatories that are as nearly perfect in detail as we can hope to see them. The designers of the earliest of the conservatories, as differentiated from the orangeries, appear to have remained long under the influence of the latter. They provided glass roofs, and windows were replaced by glass sides, but the masonry of pillar and cornice was invariably so heavy that the plants grown in them did not receive the amount of light essential to their healthy development. These came to be known as architectural conservatories owing to their being built from the designs of architects, who, in many cases, had designed the mansion, and, in their anxiety to produce a harmonious whole, had overlooked the immense importance of light and air to the various plants grown for beautifying the conservatory. These heavy buildings have been strongly condemned by several generations of practical horticulturists, and in not a few instances the difficulties inseparable from attempts to maintain plants in a healthy state for any considerable period after being placed in them induced some men of ability to go to the other extreme, and suggest a style of building better suited to the growth of plants than to their display.

As an example of the advice given by those who were opposed to the heavy buildings that obtained favour in some quarters, the late Mr. Marnock, whose ability as a landscape gardener will long be recognised, once stated that, "The conservatory should be a shell of glass of the lightest and slightest description consistent with due regard to strength." This is, of course, pushing the matter too far the other way, and it is very probable the words imply more than was intended. Extremes should be avoided in discussing the question of conservatory design, and to be in a position to arriving at correct conclusions in relation thereto it is necessary to keep constantly in view the purpose for which the structure is required. There should be a clear differentiation between the conservatory and the greenhouse, as unless it is fully recognised there is some risk of a mistake being made. This will not be made by the builder, but by the owner of the garden being too insistent upon the conditions essential to vigorous plant growth being the same in the conservatory as in the greenhouse.

Design and Position.

As far as is consistent with the adoption of a design that is in accordance with the canons of good taste, and is also in agreement with the architecture of the mansion, such provision should be made as will facilitate the maintenance of the plants in a healthy condition. Due attention is given to this important point by the well-known horticultural builders whose addresses may be found in the advertisement pages of the GARDENERS' MAGAZINE, as proved to demonstration by the splendid work they have accomplished in various parts of the United Kingdom. It must, however, be remembered that the proper functions of the conservatory are to display the charms of plants that have been grown elsewhere to a high degree of perfection, and provide a place of recreation for the owners and their friends. For the last-named purpose the conservatory is rapidly becoming more highly appreciated, and the day is not far distant when it will be regarded as essential as the music or billiard room, and, therefore, it should, where practicable, adjoin the house, and be readily reached from the principal apartments. If this is not possible, or not considered advisable, the structure may, in many instances, be built a short distance from the mansion, and be connected with it by a glass corridor, which should be embellished with plants selected with due regard to the amount of light they will obtain, and other conditions. In either case the structure should be substantial without being heavy, and the design be in agreement with the architecture of the mansion. In some cases it may be preferred to erect the conservatory in a flower garden some distance from the house, or other prominent position in the grounds. In these there is not the same necessity for the two structures to be built in the same style, and if desired the conservatory may be rather less ornate, but it should invariably possess elegance.

It is not possible to deal otherwise than in a general way with the question of size because so much depends upon the dimensions of the mansion. If the latter is of noble proportions the conservatory should have a comparatively large area, and be rather lofty, but should the house be of moderate size, the area of the conservatory should be moderate also, and the height of the two structures be proportionate. What is essential in the case of large mansions is to have a conservatory of a size that appears proportionate thereto, and in the case of medium-sized residences it is important to avoid conservatories so large as to overshadow them. Provided these conditions are fulfilled the conservatory should be as large as the initial cost and subsequent upkeep will allow. A large or medium-sized structure is preferable to a small one, more especially when it is freely used for reading, writing, and afternoon teas in the ordinary way, and as a place of entertainment on festive occasions.



INTERIOR OF A CONSERVATORY AT FARMLEIGH, CO. DUBLIN.
Erected for Viscount Iveagh by Messrs Mackenzie and Moncur.

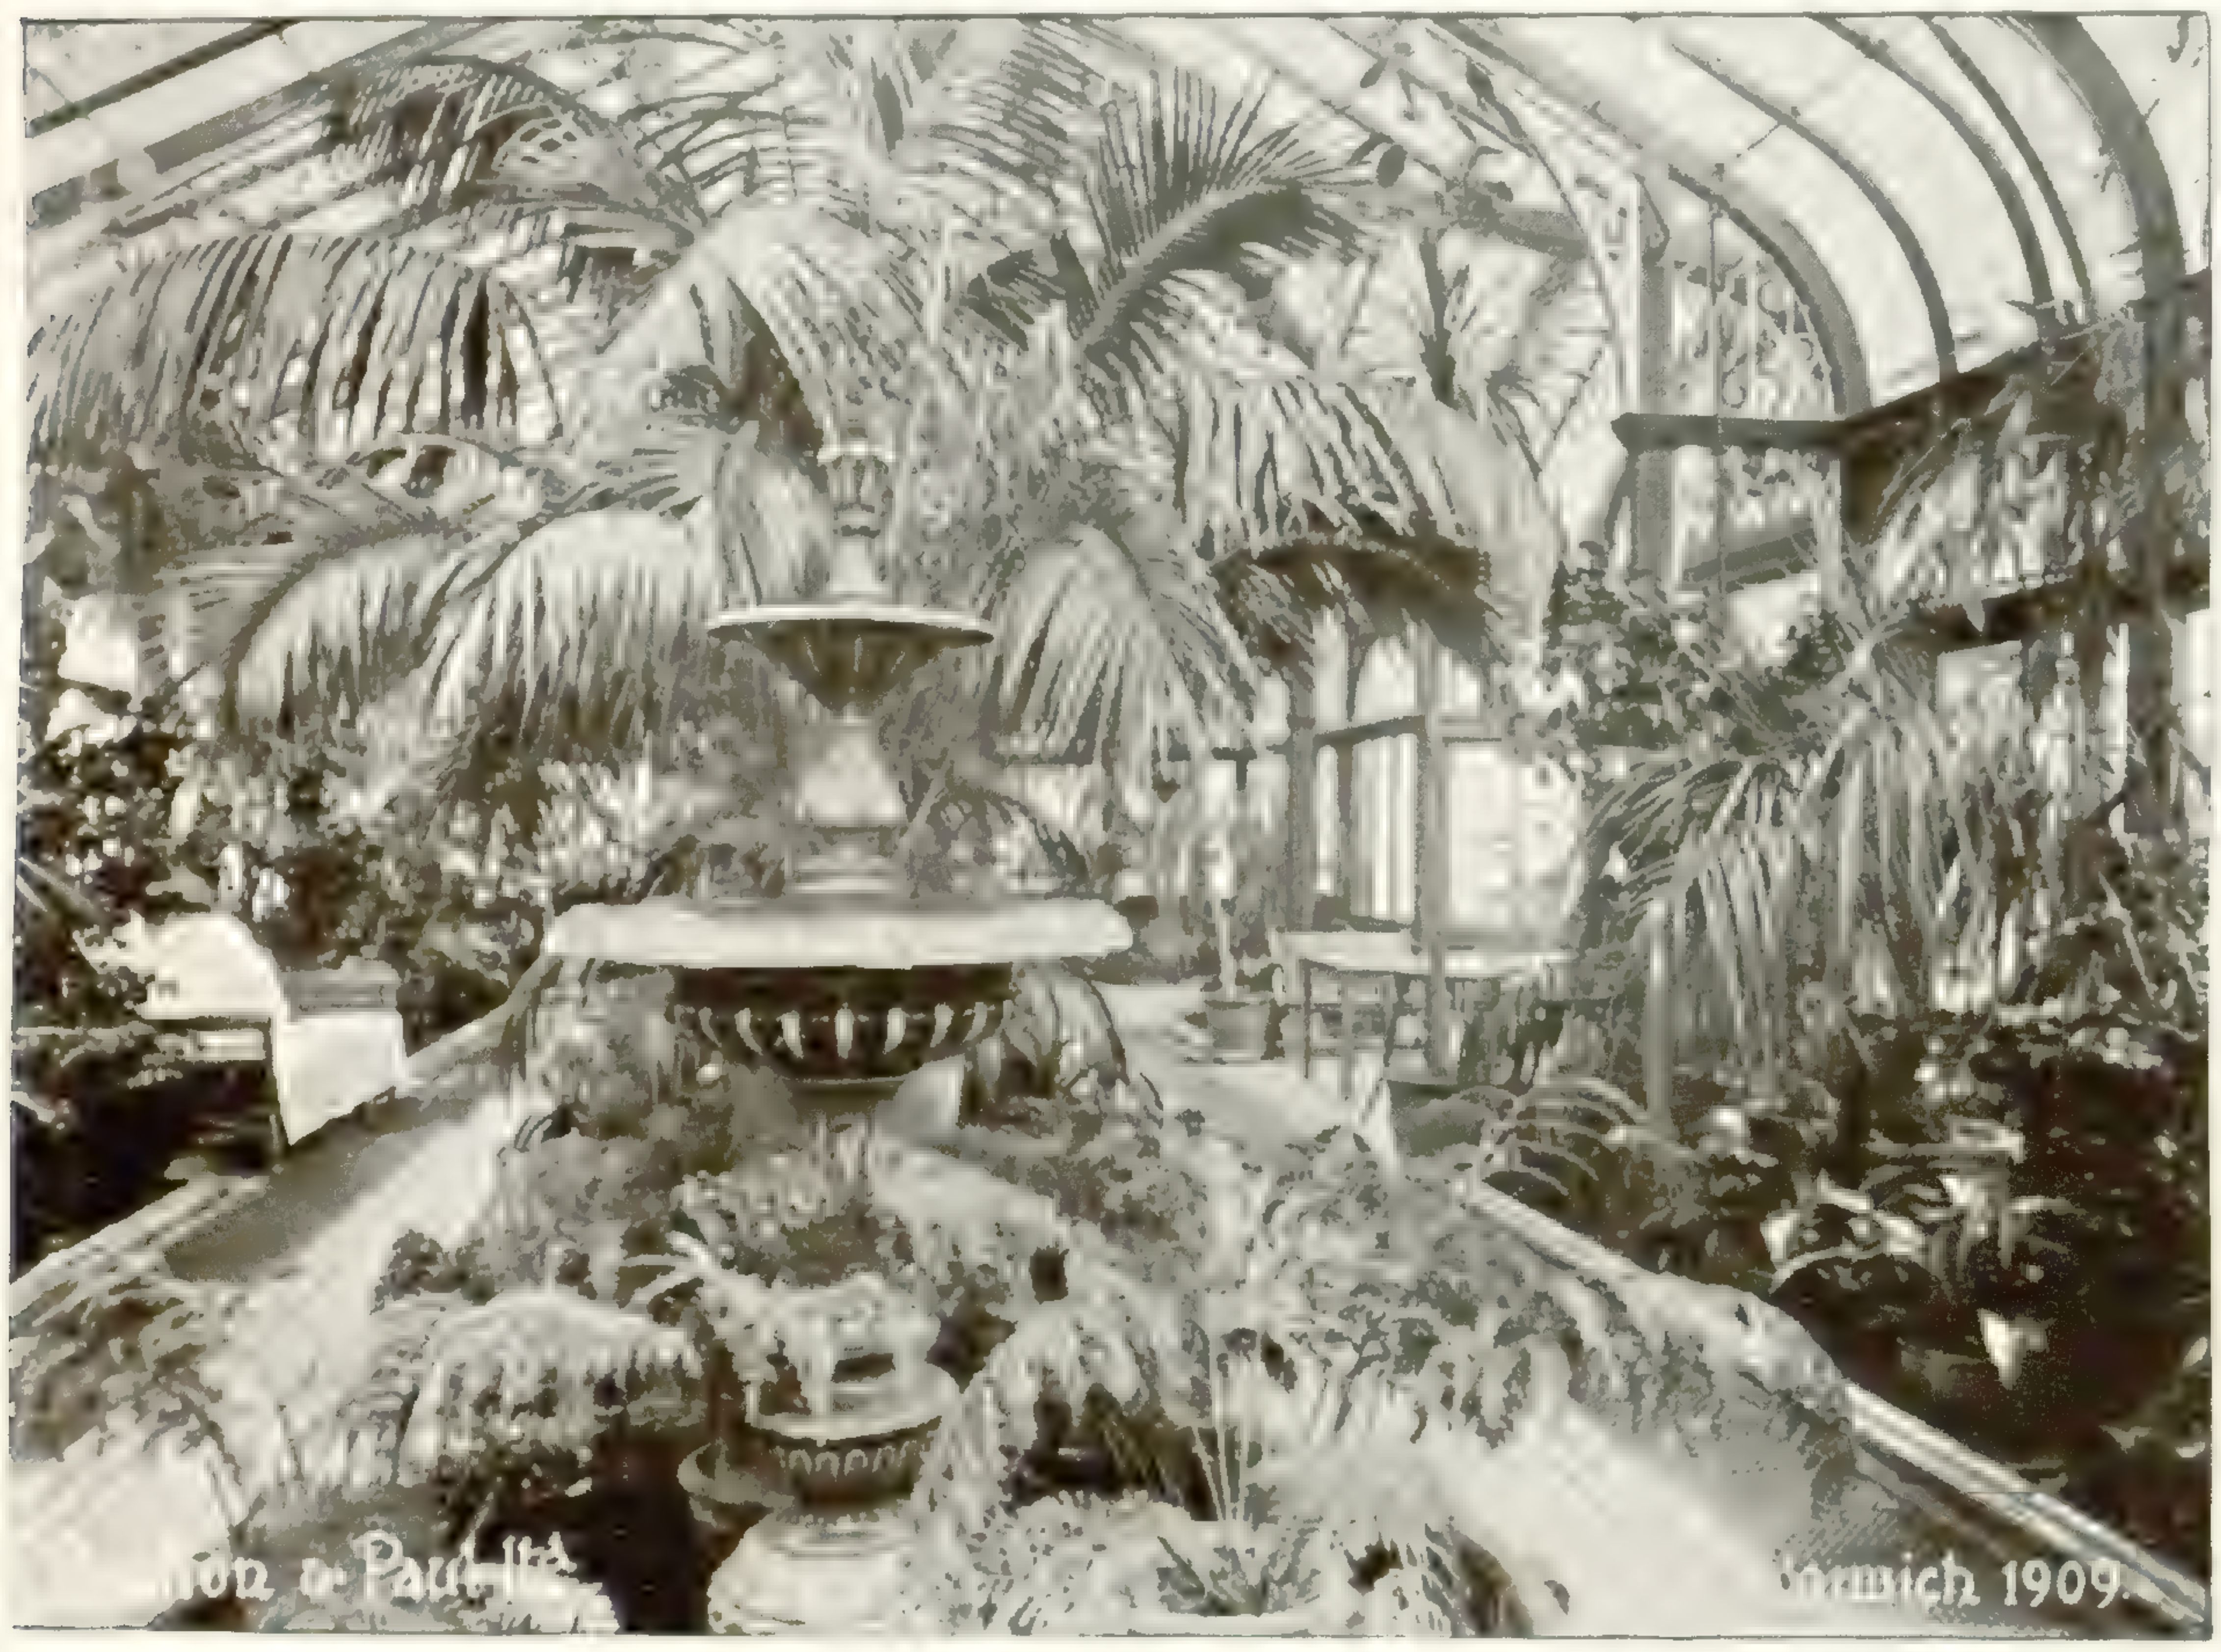
Heating and Ventilation.

The erection of a conservatory is not an everyday occurrence in any one garden, and, therefore, both materials, fittings, and workmanship should be of the best. The necessity for this need not be insisted upon at any length, because if the work is entrusted to builders who have made a reputation for themselves, the use of wood that has been properly seasoned, and fittings that will work smoothly, may be depended upon, and it will be equally certain that the structure when complete will bear the impress of good workmanship. Special attention is directed to these points because, not only are repairs relatively more costly than in the case of the growing houses, but because of the inconvenience of having workmen about at frequent intervals. The ventilation should be so arranged that the ventilators in the roof can be readily opened and closed, and the heating apparatus should be sufficient to maintain the requisite temperature in severe weather without having to drive the fires. When this has to be done there is some waste of fuel, and the heat given off by the hot-water pipes is not beneficial to the plants or agreeable to visitors. The water supply should also receive careful consideration, and, as far as practicable, rain water falling upon the roof should be caught, stored, and used.

Arrangement of Interior.

The arrangement of the interior will depend in a large measure upon whether the conservatory is to be wholly devoted to plants or whether it will be partly used for social purposes. If the health of the plants and the effective display of their flowers or foliage are the chief consideration, the arrangement may well be left to the taste of the owners, or those in charge. The points of primary importance in considering what methods of arrangement to adopt are, whether the plants are to be wholly planted in borders or grown in pots, and whether some are to be planted out and others grown in pots. A combination of the two will be preferable, because there will be considerable economy of time in watering, as compared with the exclusive use of pot plants, and it will be possible to produce more varied and attractive displays than when the whole of the occupants are grown in borders. With reference to the latter, it may be borne in mind that as many subjects quickly fill their allotted space when they have an extensive root run, the borders should be of moderate side. It is also advisable they be not formed with a rich compost, and, generally speaking, fibrous loam will be all that is necessary until the plants have occupied their positions several years. They can then be assisted with such fertilisers as will enrich the soil without giving rise to unpleasant odours. Due consideration should be given to the height of the house in making a selection, and palms, dracænas, and other subjects remarkable for the beauty of their foliage should be well represented. Climbing plants must, as a matter of course, be freely and judiciously used, but they must not be allowed to form so dense a canopy of foliage as to deprive the subjects growing below of their proper share of light.

When it is intended to freely use the conservatory for social and recreative purposes it will be necessary to restrict the area of the borders, and pave a considerable portion of the floor; tiles with a neat, yet elegant design being preferable. If the building is of moderate size it will probably be well to limit the borders to spaces round the pillars, and at the sides for climbers or other plants suitable for clothing pillars and roof trellises with foliage and flowers. There may, if so desired, be one or two circular beds for the accommodation of palms and other bold-growing subjects, but they must be so placed that they will not interfere with the area required for social purposes. As in the case of structures wholly devoted to the growth of plants, climbers should be utilised, and a charming effect may be produced by planting a strong-growing climber and a plant of semi-scandent habit to each pillar. Tacsonia Van Volxemi and Solanum Wendlandi are good types of the former, and fuchsias and habrothamnus of the latter. In practice the tacsonia is carried up to the roof and trained over the trellis, and the growth of the habrothamnus is so regulated that it produces laterals all the way up, and forms, as it were, pillars of bloom. Groups of plants, according to requirements, can, of course, be arranged on the floor, and if overcrowding is avoided, and the colours selected with proper regard to harmonious contrast, they will add immensely to the charm of the arrangement.



INTERIOR OF WINTER GARDEN, CARROW HOUSE, TROWSE, NORWICH.
Erected for the late J. J. Colman, Esq., M.P., by Messrs. Boulton and Paul, Lim.

Atmospheric Moisture.

There is one other point that must not be overlooked, and with a mention of it these notes must be brought to a close. It is this: When conservatories are used as an accessory to the drawing-room, and for social purposes generally, the plants employed in their decoration should be such as do not require an appreciable amount of atmospheric moisture, as it is not advisable to use the syringe freely as in other plant houses; or to pour water over the floor, with a view to maintain a liberal degree of moisture in the atmosphere of the structure.

George Gordon.

CONSERVATORY DESIGN.

The preceding article deals with conservatories from a historical as well as a general point of view, and it is pointed out therein that up-to-date conservatories should be elegant in design as well as suitable for plant life. That modern horticultural builders fully appreciate the fact that conservatories should be light, elegant, comfortable, useful for the display of plants, and in harmony with the buildings they are near, is evident from the illustrations given in the present issue.

Messrs. Mackenzie and Moncur, of Edinburgh and London, have done a great deal of excellent work at Frogmore, Sandringham, Westonbirt, Welbeck, Kew, Edinburgh Botanic Gardens, and other well-known establishments, and a feature of their work is lightness and elegance, combined with strength and durability. Special attention has been given to the design of conservatories used as an extra withdrawing-room, and a fine example of such design is seen in the interior view of a conservatory erected by the firm at Farmleigh, Castle Knock, co. Dublin, the residence of Viscount Iveagh. A further illustration, also an interior view, serves to indicate the wide range of design, and also the widespread operations of the firm. This shows a conservatory or winter garden adapted to the cultivation as well as the display of plants and flowers, and one not only suitable for those who love to rest amid the beautiful surroundings of leaf and blossom, but also especially arranged for those who take a keen interest in the life and growth of plants, a floral study, in fact. This particular conservatory was erected for Lord Armstrong at Cragside, Rothbury, Northumberland.

Messrs. Boulton and Paul, Lim., Norwich, are famous for horticultural work executed in all parts of the United Kingdom, and the very able manner in which they design and construct conservatories to suit any and every situation. Their work and fame is also known in Pretoria, in Turkey, Spain, and other places far afield. The firm is specially happy in the design and construction of winter gardens and conservatories, as the accompanying illustrations will prove. One of these represents a detached conservatory of ample dimensions and very handsome design, large enough to afford ample room for comfortable chairs and the necessary tea or coffee table, and still allow plenty of space for the cultivation and display of plants and flowers. This was erected for W. Creak, Esq., Montem, Salt Hill, Slough. Such a conservatory, if there is an electric light installation, becomes a delightful resting-place in the evening. The second view shows the interior of a bold and handsome winter garden erected for the late J. J. Colman, Esq., M.P., Carrow House, Trowse, near Norwich. Large palms and foliage plants are used to furnish this structure, and the fitting of the interior shows that it is used freely by the members of the owner's family, and is not regarded merely as a show place. In such a winter garden it is usual to group flowering plants in one or more special places, but it is a quite easy matter to make the house gay for special festive occasions by the introduction of flowering plants among the palms, ferns, etc., that are the regular inhabitants.

We shall in our next issue give several illustrations of conservatories that have been erected by other of the leading horticultural builders, and are of interest for their elegant design and adaptability to their environment.

HYBRID PERPETUAL ROSES AS CLIMBERS.

Your correspondent, "G. B." (p. 447) alludes to the growing of H.P. roses as wall climbers in most favourable terms. At this I do not wonder, as I know how valuable is this section for producing flowers in masses, and exceptionally early, too. Indeed, much earlier than flowers can be had from the ordinary plants that are cut down annually. I have to-day—June 11—a considerable quantity of good blooms from hybrid perpetuals, especially from Magna Charta, which is growing on its own roots, having been struck from cuttings at least twenty years since. This rose was introduced by Messrs. W. Paul and Son, in 1876, and for freedom of flowering and the delicious fragrance of the blooms is still difficult to surpass. Frau Karl Druschki is another early-flowering variety that makes a good climber, giving handsome blooms early and late. Marquise de Castellaine and Dupuy Jamain also are desirable in addition to those named by "G. B." An early crop of good flowers prolongs the season considerably, and for that reason alone they are well worthy any little attention that may be necessary.

E. M.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

AMONG THE ALPINE FLOWERS.

> "Flowers of all hue are struggling into glow
> Along the blooming fields; yet their sweet strife
> Melts into one harmonious concord."

So says Schiller, and, as we look over the rock garden, we realise the truth of the statement that the "sweet strife" truly "melts into one harmonious concord." For colours of all kinds, contrasting though they be, seem to unite in a common effort to give us pleasure. This pleasure is not lessened as we examine them in detail; nay, it is increased, for it is then, and then only, that we can study the marvellously beautiful shadings and markings of the blossoms of the season. And what a wealth of colouring there is! It is needed, too, if the floral colour is to keep pace with that of the foliage, for now nature is clad in its most brilliant green. To look at the shrubs, trees, and flowerless plants is to witness beauties of foliage of the highest degree.

Boulton & Paul Ld
ch. 1909

A DETACHED CONSERVATORY AT MONTEM, SALT HILL, SLOUGH.
Erected for W. Creak, Esq., by Messrs. Boulton and Paul, Lim.

The "leafy month" would be beautiful even were there no flowers to grace the plants, but with their aid the scene assumes an almost transcendent beauty. And the alpine flowers share in this. We have mounds of bright green, and we have masses of colour from flowers of all kinds. It is difficult to choose from among them a few from which to draw an inspiration. We shall begin, for one, with

Tanakea radicans.

This pretty little Japanese alpine has not yet become well known, but its quiet beauty will commend it to many who like a really nice plant with but little display. With its neat leaves and its somewhat spiræa-like white flowers on stems some six or nine inches high, it looks well in a shady and rather moist part of the rock garden. It is not yet well known, and will possibly fail to appeal to those who see but a small plant, but a little group will commend it much better. On rockwork, especially against a dark rock, it looks remarkably pretty. Hardy enough to withstand our winters, this Tanakea radicans is a good little plant of considerable grace and beauty.

Primula Cockburniana.

A fresh vista of probable variation in the world of primroses has been opened up by the introduction of Primula Cockburniana a few years ago, in view of its colouring being made the basis for work in hybridising operations, and some good results have already followed, such as is shown in Unique, Messrs. Veitch's hybrid, so well shown at the Temple and other shows.

But to the alpine lover there is a peculiar fascination in all plants of original species, which seem always to him to be more in agreement with the rock garden than the many lovely flowers which are the product of modern hybridisation. It may be prejudice, but this feeling certainly exists, and in Primula Cockburniana we have a plant which gives force to this idea. There is about its aspect an appearance which compels admiration, although it is mingled with some questioning as to the harmony of colour with other flowers. Yet well-grown plants, with their whorls of orange-scarlet flowers set tier above tier on a stem some six or nine inches high, or even more, are decidedly pretty, and a few plants in the rock garden here cause me to write of it now. It has one uncertain feature about it, and this note is largely designed to emphasise it. This is its doubtful perennial character. Is it truly biennial, as some suggest? Is it hardy, as some seem to doubt? These points do not admit of any confident reply, and I am doubtful if we can be positive about them. It seemingly has proved only a biennial with some, but in these places this has apparently been due to its free-seeding, and from its being in dry soil, where it had not the vigour to enable it to stand the strain of seed-bearing. In places where it was planted in moist soil it seems to have been much more vigorous and to have shown itself a true perennial. But, on the whole, I am inclined to class it with P. sikkimensis in this respect, and to think that it may be as well to renew it occasionally at least from seeds in gardens where it does not sow itself frequently.

But self-sown plants are the best, and a little bare space round the old plants will probably result in a sufficient supply of self-sown seedlings appearing to maintain the succession. At the base of the rock garden this pretty primula is a distinctly pleasing flower.

Dodecatheon Meadia.

One is almost inclined to envy the memory of Dr. Mead, whose name is enshrined in the specific term applied to Dodecatheon Meadia, a very beautiful plant still in flower with the writer in the beginning of June. It is an old plant, though but little noticed nowadays. Why, it is difficult to say, as there are few prettier hardy alpines for the base of the rock garden than these American cowslips. I do not say that D. Meadia is the best of all—that is a matter of taste—but it is certainly very beautiful, with its tufts of unequally-toothed leaves and its ten to sixteen-inch stems, each bearing a most elegant umbel of flowers. These flowers are very beautiful with their long, reflexed petals, and the pose of the plant and its flowers is exceedingly attractive. This American cowslip of Dr. Mead is very fine in any of its various colourings. It can be had in white or lilac, as well as in the rosy-purple which is the prevailing shade among the plants.

But this plant, although quite hardy, is not so easily retained in the garden as one would imagine, from what one hears of it. A lover of moisture, it does not seem to require it so much in winter, and may even be lost at that season if too wet at the roots. It is better to supply its liking for shade and moisture in summer and for rest in winter by planting it in partial shade, and with a north or north-east exposure near the foot of the rock garden, but giving it a well-drained spot. This is, at least, the situation found by the writer to be the best. It can be grown in the border in a position of much the same kind, and few things are more prized than a group of Mead's American cowslips in bloom.

S. ARNOTT.

ESPALIER ROSES.

It may well be doubted whether roses of the non-rampant order can be shown off in any manner as beautifully as upon espaliers, and the subject of their growth in this style, the nature of the supports, and the places that are best adorned by them, is worthy each gardener's most earnest study. Ramblers and other vigorous climbers will not do for the purpose, except when an espalier has assumed such enormous proportions that it may more justly be called a trellis; a twelve-feet ornament of the kind, covered by luxuriant roses, makes an ideal boundary for the end of a tennis lawn, or a separating line between flower and vegetable garden. It should be built of natural wood, either peeled or with the bark on, never of painted deal, which last is admissible only on a small scale, and then the horizontal supports can be painted wires, not straight laths, which have too prim an effect.

Probably the most attractive of all woods to use for espalier poles is silver birch, with the bark on; larch is good, and is very generally used, though some growers believe that there is a resinous quality even about this wood when old that certain roses object to. When horizontal supports are to be of wood the appearance is best when they are irregularly bent, bowed, and knotted, not straight, and they should be a great deal thinner than the wood of the supports, otherwise the result is too heavy-looking. Iron espaliers, painted, are obtainable of almost any height and shape, rounded, for sloping edges, corner-wise, or with an arch in the centre, which allows for a different rose on either side.

These iron uprights are always sightly; it is the natural woodland or rustic garden that they do not really suit; they can be painted the green of the rose foliage, or the dull brown of the branches, and will soon be undistinguishable beneath their living covering; or if painted white have an elegant effect much admired, and perfectly in keeping with terraced gardens, or those near villa residences, large or small. Let them be kept out of the old Elizabethan manor's environs, and never show their trim outlines by a farmhouse or old-fashioned cottage, however. Roses that flourish upon espaliers are very numerous; it is, I imagine, the perfect treatment for William Allen Richardson, the rose whose glorious apricot tint is never seen upon a hot wall or fence. Frau Karl Druschki and Hugh Dickson are two others that I especially value for this use, their robust nature making them revel in the airiness and space for branch development. It should be remembered that the espalier rose grown in the open has always two aspects, south and north combined, or west and east; a bush provides its own shelter for one of its sides by the thick mass of interior branch and foliage. L'Ideal and Reine Marie Henriette are two old roses that may serve as types for those that succeed less well; in my experience they require the shelter of a fence or wall, or at least to be backed by the close mesh of a trellis. Gloire des Rosomanes, Gruss an Teplitz, Beauté Inconstante, Gustave Regis, Bellefleur, a copper-yellow, red-flushed single, are roses that have uncommon and delightful effect when espalier supported, being shown off to perfection, and thus enabled to prove the distinctiveness of their charms.

In shaded or draughty positions there are still roses that can be thus cultivated; in the former the varieties of rugosa are all fairly certain to thrive and attain each year a finer luxuriance. It will be necessary to limit their branches to the number that can be best tied to the horizontal supports, and cut away any superfluous shoots from root suckers, although some of the latter can be retained, and used to increase the upright branches, with a view to the ultimate elimination of old wood. In the draughty situations, where some sunshine is gained, Wichuraianas, as distinct from the more rampant Wichuraiana hybrids, and the lovely cultivated Penzance briars, are the best choice. By the bye, an espalier boundary line of sweet briar makes a fair and fragrant protection on the north side of a rosery.

By planting bush roses along the edges of a lawn a rather wide space is necessarily sacrificed; when espaliers are set up, and a rose put on the outer side of each, the turf is less encroached upon, and, though fewer varieties can be grown, the yield of blossom will probably be greater. A foot-wide continuous border will suffice—continuous except for exits and entrances, of course—and between the rose roots under and in front of their branches, will be space for innumerable light-growing dwarf perennials, violas, pinks, Iceland poppies, aubrietias, alyssums, arabises, double daisies, miniature geraniums, and geums, rock pinks and phloxes, Tunica saxifraga, Saponaria ocymoides, Viola cornuta, mossy saxifrages, sedums, rock roses, dianthuses, etc., etc. As an inner hedge to a front garden that is bounded by the privet, laurel, or euonymus, in which many landlords delight, a rose espalier series enables the tenant to have beautiful blossoms visible from his windows; the same method serves to partly hide vegetables from flowers along the kitchen garden borders, an incredibly large number of rose species and varieties being thus sampled without encroaching upon the pleasure grounds.

It has been objected that espalier training necessitates the sacrifice of a great deal of rose branch; it must be remembered that this seeming waste intensifies the vigour and productiveness of the branches that remain. As far as my knowledge goes there is no class of rose that is not suitable for espalier culture, but all depends upon the size of the espalier; a miniature Polyantha, such as White Pet, gives a unique show when trained out only a foot above the ground, a luxuriant Crimson Rambler, or pink Dawson arching rose will demand a support of great height and breadth. Then, again, various methods can be pursued with different roses; in one case the new season's growth, springing up from the roots, can be bent and employed alone; in another the old wooded stems that have been trained out will send forth young lateral shoots for the summer clothing. Experiments should be tried, and results recorded in note books as well as memory. The old Gloire de Dijon, as a veteran espalier tree, will give glorious bloom, and young roses can be used to hide its bare lower stem and branches. M. H.

Hæmanthus Katherinæ.—This is one of the most showy of the greenhouse plants flowering at the present time. While the flowers remain fresh, keep the plants at the cooler end of the structure, but remove to an intermediate house as soon as the blooms fade, to complete and mature their growth. After this has been done, a period of rest is necessary. Propagation is best effected by off-sets, potting these up and keeping them in a moist condition till roots have formed. Many species of hæmanthus are very showy, and deserve to be more grown in private establishments.—W. S., Belford Hall Gardens.

NEW BOOKS.

A HISTORY OF GARDENING IN ENGLAND.

By the Hon. Mrs. Evelyn Cecil (John Murray, Albemarle Street, W.). Price 12s. net.

To those whose avocations bring them into contact with horticulturists of all classes, it has not been by any means unusual to hear expressions of surprise that so little attention should, during the last century, have been given by writers on horticultural matters to the historical side of gardening. We have on many occasions heard such expressions, and we have more than once had our attention called to the immense advantage it would be to those interested in horticultural activities to be able to obtain ready access to information relating to the work of past generations of horticulturists, and to the fashions that have influenced the garden during the period in which it has occupied a commanding position in this country. We have been in full agreement with those who have regarded a well-written history of gardening as a necessity, and certainly none could have had greater pleasure in placing the first edition of the Hon. Mrs. Evelyn Cecil's important work on their book shelves, than was experienced by ourselves in making room for it in our library. In agreeing with those who believed in the desirability of such work, we have not shared in the surprise that has been felt because the general body of writers showed no desire to deal with the historical aspects of gardening. To write the history of such an important and complex subject as gardening is a task so heavy that a literary man or woman of the highest ability might well be excused for shrinking from it. The writer of a history has not only to state the facts clearly, but he has to devote an immense amount of time to research, to the making of notes, to the marshalling of facts, and to estimating their relative importance for the purpose of maintaining a proper balance between the several periods over which the historical purview extends. No one who has not considerable leisure could engage in such work with a prospect of success, and but few of those who possess literary ability of a high order have much spare time on their hands.

It will thus be seen that the task of the historian is beset with difficulties, and that to achieve success abilities of an exceptionally high order are necessary. That the knowledge necessary to the successful accomplishment of the great task the authoress of "A History of Gardening in England" set herself has been forthcoming is abundantly evident, and it is gratifying to know that the splendid work she has done is fully appreciated by garden-lovers. We have evidence of this in the fact that the work has passed through two editions, and that the publication of the third edition, at a somewhat lower price, has greatly stimulated the demand.

The work opens with an interesting chapter on monastic gardening, in which the authoress shows how valuable was the work accomplished in the gardens of the monasteries for a considerable period after the foundation of those religious houses. Then in the following eleven chapters we have clear and otherwise excellent accounts of gardening in the thirteenth, fourteenth, and fifteenth centuries, early garden literature, early Tudor gardens, the Elizabethan flower garden, kitchen gardening under Elizabeth and James I., Elizabethan garden literature, seventeenth century gardening, gardening under William and Mary, and landscape gardening. The chapter devoted to gardening in the 19th century is perhaps the weakest part of the book, and in a future edition should be so amplified as to give some idea of the remarkable development which fruit culture and commercial horticulture underwent during the century.

The book, we would add, is profusely illustrated, and should have a place in all garden libraries, and, indeed, on the bookshelves of all who are interested in the gentle art of gardening.

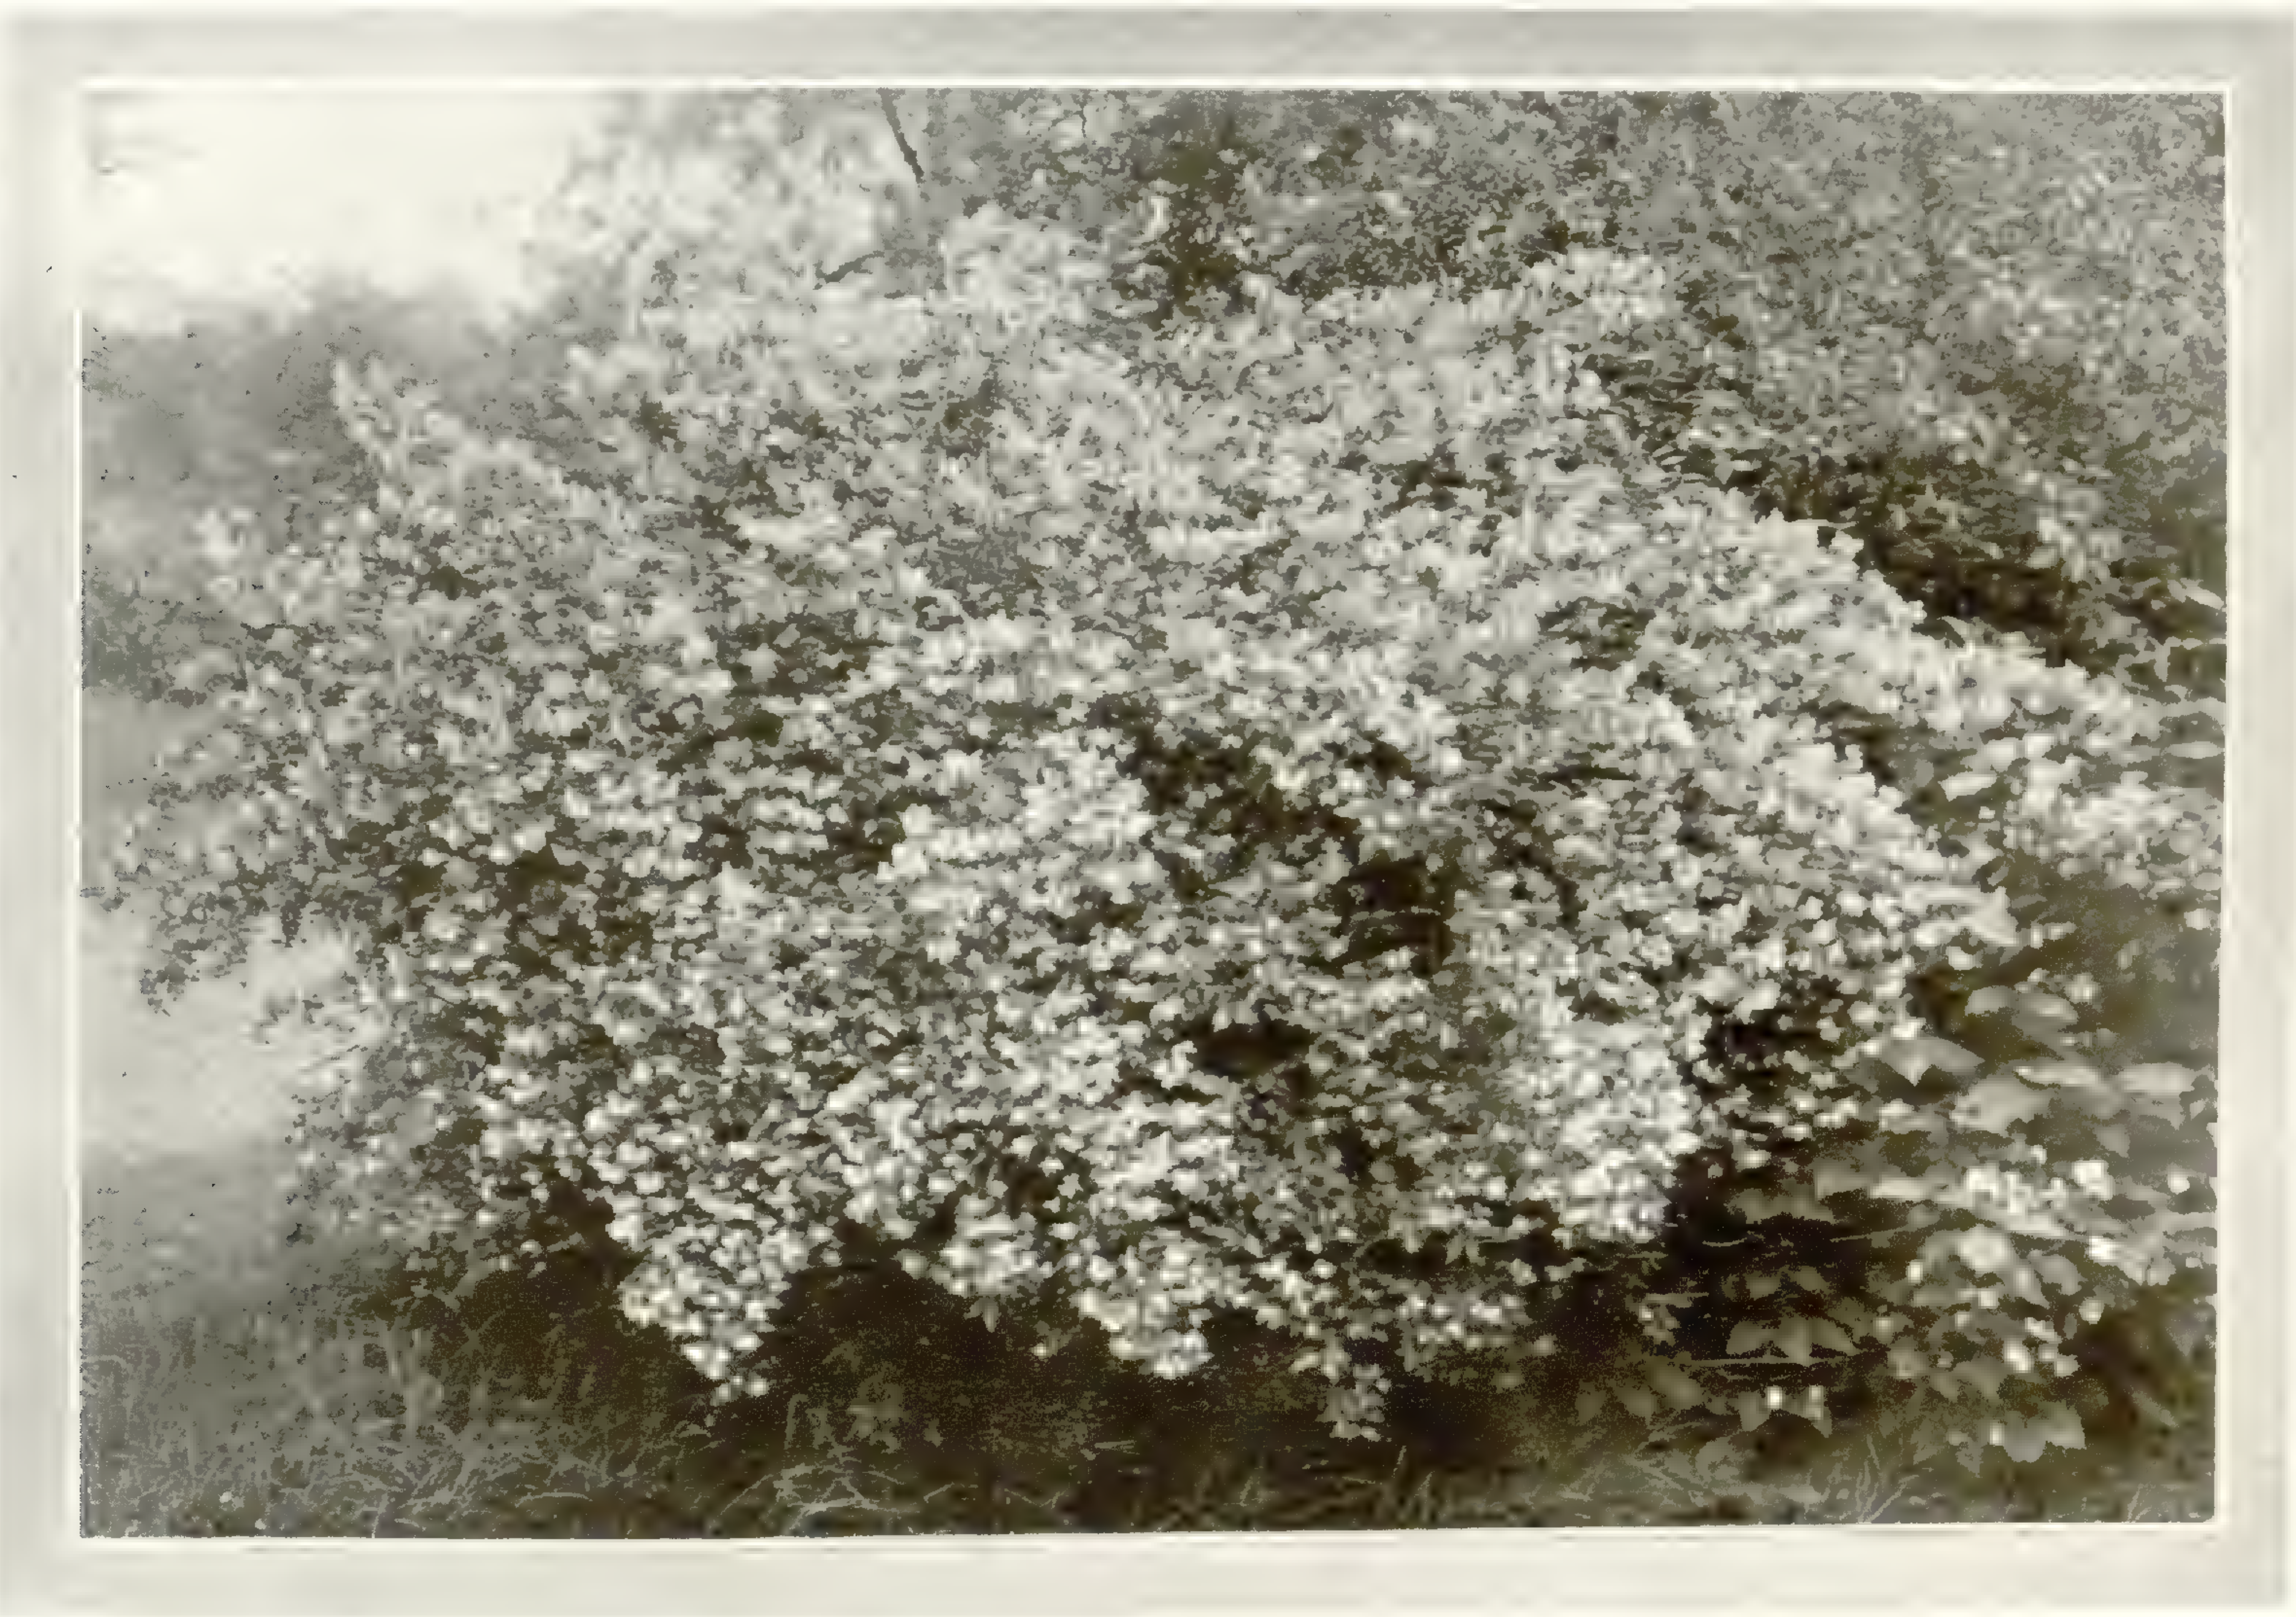
WINDOW GARDENING.

By T. W. Sanders. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price 2s. 6d. net, post free 2s. 10d.

Window gardening has become so immensely popular of late years that a handbook on the subject that is comprehensive in treatment, bright in style, and sound in teaching has become a necessity, and we therefore heartily welcome the publication now before us, and strongly recommend it to the notice of those who devote attention to the cultivation of plants on the window sill or in rooms. The author, who, we need hardly say, is fully conversant with his subject, informs his readers in a very interesting manner, not only how they may successfully cultivate a large number of beautiful plants in rooms and maintain their window boxes in an attractive state throughout the year, but shows with remarkable clearness how readily balconies, verandahs, and flat-roofs may be embellished with ornamental plants, and walls be clothed with climbers of great beauty. The cultivation of plants in indoor apartments is dealt with in a manner that becomes its importance, and the reader is placed in possession of the information necessary to ensure success in selecting as well as cultivating the numerous flowering and fine foliage plants that may be grown under the conditions that usually obtain in living rooms. The culture of Japanese trees, cacti, insectivorous plants, orchids, roses, and many other uncommon plants is described, as well as that of palms, fuchsias, and other subjects that are generally recognised as of special value for the home. In dealing with the cultural details, such matters as potting, watering, and feeding plants have prominence given them, and ample advice is given on the all-important question of keeping the several subjects free from fungoid and insect enemies. There is a series of chapters on "Floral Decoration in the Home," from the pen of Mrs. Ffreda Wolfe, which add materially to the interest and usefulness of the work. The book is freely illustrated and elegantly bound, and should become highly popular.

PHILADELPHUS MICROPHYLLUS.

This pretty little mock orange is well worth planting, for its distinct appearance always attracts attention, whilst its decorative qualities are of no mean account. It is an American species, which, when mature, attains a height of three feet or so. No other philadelphus is anything like it in appearance, for its branches are fine and twiggy and become interlaced with each other to form a regular thicket. The leaves are very tiny, and grey in colour, whilst the flowers are smaller than those of other kinds, but powerfully fragrant. Upwards of twenty years ago M. Lemoine, of Nancy, was struck with the possibilities of the shrub, and he took it in hand and crossed it with the common Mock Orange (Philadelphus coronarius). The progeny turned out quite a success, as is instanced by that plant of sterling merit, Philadelphus Lemoinei, or, better still, the remarkably fine form known as Lemoinei erectus, which is easily one of the most ornamental flowering shrubs we possess, as so well shown in the accompanying illustration of a specimen at Kew. Since the advent of these hybrids many others of the same description have appeared, which combine to make up an exceedingly useful group of shrubs. P. microphyllus, if planted in a group, should be so arranged that when fully grown no two plants will touch, for a very much better effect is produced when each plant can be seen separately than when several are grown together to form one dense mass. This advice applies with equal force to P. Lemoinei erectus. D.



PHILADELPHUS LEMOINEI ERECTUS.
One of the finest of the hybrid mock oranges obtained from the intercrossing of P. microphylla and P. coronaria; the flowers are white.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

PHAIUS.—The late flowering varieties of the hybrid phaius will now require attention, and to be repotted or top-dressed if necessary. The late flowering kinds are generally those which have P. Humbloti as one of their parents. Although not so plentiful or so well known as the hybrids that have been derived from P. tuberculosus, they are far more easily cultivated, being more vigorous in constitution, and are not so liable to have their foliage disfigured with the black spotting so frequently found in P. Cooksoni, P. Norman, and others. Being more vigorous, they are also larger rooted, and therefore require more liberal treatment in respect to pot room. It is surprising how rapidly the pots become filled with roots when the plants become strong. It is therefore advisable when repotting is done to allow ample root space. They should be carefully turned out of their pots, by first loosening the roots that have become attached to the sides. As they are somewhat fleshy they are easily damaged if great care is not exercised. The old potting compost should be removed, and any dead roots cut away. Where there are a number of back pseudo-bulbs, the rhizomes between the pseudo-bulbs should be severed, as these back bulbs generally have dormant eyes that are capable of producing new growths. The size of specimens may be thus increased, or they may be taken away and potted up separately to increase the stock. The pots should be clean, and filled to at least one-third of their depth with clean broken crocks. The potting compost we find most suitable is a mixture of yellow fibrous loam, chopped peat, some broken leaves, and chopped sphagnum moss, with sufficient sand and finely broken crocks added to render the whole porous. This compost should be made firm about the roots, and if desirable a thin layer of chopped sphagnum moss may be spread over the surface of the potting compost; this adds to the appearance of the plants where they are used for exhibition or for decorative purposes in the house. Water as soon as repotting is completed, with rain water, taking care to thoroughly moisten the compost through. The plants should be carefully shaded at all times, but more especially for a time after repotting, until at least the new roots become established in the fresh potting compost. Insect pests, such as scale, red-spider, and thrips are their greatest enemies, and for the two latter the plants must be kept under careful observation at all times. If the plants are sprayed at regular intervals, and fumigated or vaporised about once a fortnight, there is little difficulty found in keeping these pests in check. Where red spider is observed the leaves must be carefully washed with a soft sponge, using rain water, into which a very little soft soap has been added. The leaves being soft and fleshy in the young state, more than ordinary care is necessary. The atmosphere should be kept in a humid condition by frequent syringing between the pots, and damping the floors, staging, etc. Ventilate liberally whenever the outside conditions permit. H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CALLISTEMON LANCEOLATUS. — Like many species of the nearly-allied genus melaleuca, this is a showy flowering shrub needing the conditions of a cool greenhouse or conservatory for its successful cultivation. The culture is comparatively easy, but, as with most hard-wooded plants, care must be exercised in watering. Propagation may be effected by sowing seeds, which are freely produced on large plants. But seedling plants do not flower so quickly as those grown from cuttings. The cuttings should be made of nearly-matured growths, and inserted in sandy soil, placing them under a hand-light or bell-glass. When rooted they should be potted off, using a compost of loam, peat, and sand, and while young pinch out the points of the shoots as may be necessary to ensure bushy examples.

CINERARIAS. — Seedlings raised from seeds sown in the spring should be pricked off into boxes, which are better for the purpose than pots. Fill the boxes with compost of a light texture, which includes a goodly proportion of leaf-mould. Put the seedlings two to three inches apart either way, and then stand the boxes in an unheated frame under a north wall, if possible, and on a bed of ashes, which should be previously well-damped. Keep the frame closed for a few days, syringing morning and evening. On warm nights the sashes may be removed to allow the foliage to have the advantage of the dew. But in the morning close the frames, and if the sun reaches them, shading must be given.

SALVIA SPLENDENS GRANDIFLORA. —The bright scarlet flowers of this salvia are very valuable during the dull days of late autumn and winter. Rooted cuttings should be repotted directly they are ready for a shift, and on no account should they be allowed to become checked in their growth. Use pots of a liberal size for the plants that are raised early, as these will grow into fine specimens by autumn. Place them out of doors on an ash bed as soon as the weather permits. Pinch out the points of the shoots at the second leaf, and syringe the foliage each evening to check red-spider.

AGATHÆA CŒLESTIS.—A few of the best plants should be potted up for flowering in the autumn. Cuttings may be rooted now, it being a good practice to place four cuttings in each 2½ inch pot, and when rooted transfer to larger ones without dividing them. If treated like cinerarias until the end of September, good results will be obtained. No flower buds should be allowed to develop before the end of September, and the growths should be pinched two or three times to promote a bushy habit. In October they should be removed to a cool greenhouse, placing them close to the glass on a shelf. When the flowers begin to open liquid manure may be applied.

MIGNONETTE. — No flowers are more appreciated than mignonette. For pot culture the tree kinds are more often selected. But the dwarf branching varieties are very useful in pots also. Whatever kind be required seed should be sown from now onwards. Mignonette requires a good compost of loam and leaf-mould, firm potting, and good treatment at all times. The seed should be sown in 3in. pots, and be lightly covered with fine soil, and as soon as the seedlings are well through the soil they should be thinned out to one plant if for pyramidal specimens, and to three plants if dwarf, bushy plants are required. When the small pots are filled with roots shift into 5in. or 6in., using the same kind of soil as before, and exercising care when potting to avoid breaking the ball of soil.—W. Staward, Belford Hall Gardens, Northumberland.

THE FLOWER GARDEN.

BEDDING OUT, and the consequent pressure of work, has now somewhat slackened in most gardens, but there is still a formidable programme on hand. As regards weather, it has suited bedding plants perfectly, and all have started into growth well. In order to get these to fill out the beds quickly, all flowers and flower buds should for a week or two be kept pinched off, and the pegging down and regulating of any growths requiring such attention should be done at the earliest possible moment. Unless soft water is obtainable in quantity it is better not to water the plants until obliged to do so, and then do it thoroughly; surface watering only ends in enticing the roots to the surface, many or most of these perishing during very hot weather, unless the beds have been previously mulched, which cannot always be done. Fuchsias should have all straggling growth stopped, as this will ensure a profusion of bloom later on, and plants of compact growth.

SHRUBBERIES and outlying places are just now, owing to the mutiplicity of duties in other directions, apt to be neglected, and noxious weeds allowed to run to seed unknowingly; this frequently happens where labour is restricted, and something has to go undone; but, taking into consideration the after consequences of such neglect, such weeds as these should not be overlooked, and even if time cannot be found to do the usual weeding in the proper way, roughly hoeing them through will prevent their seeding, and keep them in check until proper attention can be devoted to them.

HERBACEOUS AND MIXED FLOWER BORDERS have suffered somewhat from the heavy rains during the early part of the present month, and, although staking and tying in of these subjects were duly attended to, yet the breakages have been many; the beaten condition of the surface of the beds and borders have necessitated more frequent hoeings than is usual at this season of the year, but this has helped to keep in check the ravages of slugs and similar pests, these having been extra active during the recent showery weather. Soot and lime scattered about does much to keep them in check, but rain soon renders both inoperative. Many of the stronger growing plants in the herbaceous borders are already beginning to crowd out some of the weaker growing kinds, and the careful staking and tying in of these should be closely followed up, and even in extreme cases the thinning out or entire removal of some of the growths may be resorted to, for the preservation of the weaker growing, and more often valuable plants, is to be preferred to the rampant growth of the stronger growing and less valuable.

ANTIRRHINUMS, Canterbury bells, foxgloves, columbines, and such plants of a hardy character, which flower during the second year, may now be sown in the open border; these, unless the borders are unusually narrow, are best sown in drills, and if in a half-shady position, so much the better. The drills should not exceed half an inch in depth, and should be far enough apart to permit of the free use of the hoe after the seedlings appear. Should the weather be dry at the time of sowing, water the drills, and sow on the damp soil, the drills in their turn being filled in with dry, finely sifted soil, unless the natural surface soil is in a well pulverised condition.—W. Hedley Warren, Aston-Clinton Gardens.

HARDY FRUITS.

SUMMER PRUNING.—Fruit trees of all descriptions will now need frequent attention to pinching and training the young growths, otherwise confusion will follow, and the sap will not be equally distributed over the trees. Red and white currants should have their side shoots pinched back to five or six leaves. If it is desirable to allow the branches to extend the points of these should be pinched out when they have grown about twelve inches in length; the growths upon cordon and horizontal trained pear trees should be pinched back when they have made about six or seven leaves to within three or four leaves. The leading shoots upon all the main branches should be allowed to grow unchecked, and tied loosely, but securely, to the walls; these same remarks would apply to espalier trained trees. Some few varieties of pears form fruit buds at the extremities of the shoots, and careful attention should be paid that these are not summer pruned; bush or pyramid trained apple, pear, and plum trees should also receive attention to the pinching and thinning out the young growths, pinching all side shoots back to within five or six leaves, and the leading shoots should be allowed to grow away unchecked for some weeks yet. The side growths of the loganberry should be cut back to three or four leaves, and the growths tied carefully to the supports, or otherwise when rough winds prevail they will be broken off. Pay attention to the tying in and training the young growths of peaches, nectarines, apricots, and cherries, pinching or cutting back to within four leaves any growths that are not required; shoots which have a tendency to grow too strong should have their points removed; this operation will induce them to make three or four weaker growths, which can be laid in if space will allow, or if not required they should be pinched again at one leaf.

HARDY VINES.—These will require frequent attention, both in regard to pinching the sublaterals to within one leaf, tying, and pinching the young growths. In favourable seasons good crops of grapes will invariably ripen if proper attention is given. Where vines are trained to walls the laterals should be thinly disposed over the surface, but, on the other hand, a sufficient number of growths should be left to cover the walls completely. There are no plants which are used for covering walls that have a more charming and ornamental effect than hardy vines when clothed with healthy foliage from the bottom to the top of the wall. A sharp look out should be kept for red spider and mildew, using—as advised in a previous calender—flowers of sulphur dusted occasionally over the foliage; also frequent syringing with clean soot water, applied with the garden engine, is beneficial in keeping the foliage clean and the vines in a healthy condition. Bordeaux mixture, when used at the proper strength, is an effective fungicide for mildew, but on no account should this be used when the vines are in flower. Vines grown in the open quarters to stakes will require the same amount of attention with regard to tying and pinching the laterals, also constantly stirring the soil with the Dutch hoe to kill weeds, and to check rapid evaporation.—Henry R. Farmer, Cardiff Castle Gardens.

Rose Goldelse. — As a sweetly-perfumed rose and an early-flowering variety, this, introduced by Henner in 1902, deserves extended cultivation. In colour it is pale yellow, with a much deeper shade of apricot-yellow in the centre; it remains quite full, even when expanded.—E. M.

GREAT FLOWER SHOW AT LIVERPOOL.

Held in conjunction with the Royal Agricultural Society's Exhibition.

A year ago we described the display of plants, flowers, and fruit which was made at the "Royal" at Gloucester as the best the society had ever had, and it is now our pleasant duty to record another, and even better, show held at Liverpool from Wednesday, June 22, to Saturday, June 25. It is very evident that the society means its flower show to be something more than a mere item in the programme, and, indeed, it was the undivided opinion of both exhibitors and visitors that the exhibition of the past week was well up to the average of the best horticultural shows in the land. The exhibits were well arranged in spacious marquees, and the whole management reflected the utmost credit upon the Hon. John R. de C. Boscawen, horticultural steward, and Mr. Peter Blair, the energetic manager, who spared no effort to make the show successful from every point of view. Unfortunately the morning of Wednesday was visited by heavy showers, but the afternoon was fine, and there was a good attendance. H.R.H. Prince Arthur of Connaught visited the show, and made a complete tour of the horticultural tents, afterwards expressing great delight with what he had seen.

GREAT FLOWER SHOW AT LIVERPOOL. [Photo: R. Brown, Liverpool.

Part of the Group of Ferns staged by Mr. H. N. Ellison, West Bromwich.

COMPETITIVE.

The schedule opened with a class for a group of miscellaneous plants, in and out of bloom, occupying 350 square feet. There were four entries, and the redoubtable champions, Messrs. James Cypher and Sons, Cheltenham, were awarded premier honours. Their group was a most beautiful arrangement of orchids, liliums, and kalanchoes, interspersed with some remarkably fine crotons and other fine foliage plants. Rising high in front were some splendid Oncidium flexuosum majus, with a pair of Cattleya gigas on a lower level at either side. The corners were marked by pyramids of beautiful foliage, surmounted by Cocos Wedelliana, and towards the back of the group were tall acacias and crotons, with a fine kentia overtopping all. In minor detail and finish the work of a master hand was evident. Mr. W. A. Holmes, West End Nurseries, Chesterfeld, secured second prize, and Mr. William Vause, Leamington, was third.

Messrs. James Cypher and Sons, Cheltenham, were the only exhibitors in a class for a collection of orchids occupying 100 square feet. Their exhibit included many beautiful lælio-cattleyas, dendrobiums, and cypripediums. A plant of Epidendrum prismatocarpum, nine big spikes, and a brilliant Masdevallia Harryana were very conspicuous, and, altogether, the firm is to be complimented on contributing a very attractive and interesting exhibit. One hundred square feet of staging filled with begonias of tremendous size and rich colours was a sight to see. Messrs. Blackmore and Langdon, the only exhibitors in the class, are, as is well known, pastmasters in the art of growing and showing begonias, and the collection set up on this occasion added still further to their laurels.

A class that appealed strongly to us, although not treated in the way we should have liked, was that for a group or display of hardy cut flowers and plants, arranged on 200 square feet of ground: rock, stone, etc., allowed. We anticipated a representation of a growing border, or bed, with the flowers arranged in a natural manner. Mr. Jas. Saul, nurseryman, Preston, the winner, however, had a group built up on the lines adopted by exhibitors in the stove and greenhouse group classes, and we readily admit he made a fine show.

Messrs. Caldwell and Sons, Knutsford, adopted the use of plants in pans, and but for the fact that this compelled a certain formality of arrangement, the exhibit was good. They secured second prize. Messrs. G. Gibson and Co., Bedale, produced a blaze of colour with a mass of Oriental poppies and bright pæonies. Other good things of lighter shades supplied the necessary toning down, and made an effective display. Third prize was awarded this exhibit. Two competitors staged collections of cut hardy perennials on a table space of 15ft. by 5ft. Messrs. R. Harkness and Sons, Bedale, were adjudged winners. Among the most telling vases were Papaver's Oriental Queen and Oriental King, and double Pyrethrum Lord Rosebery. Messrs. Gibson and Co. followed with a capital array of verbascums, delphiniums, and many other useful subjects.

Lim., Canterbury. Frau Karl Druschki, Mrs. John Laing, and Ulrich Brunner were put up in masses, with Hiawatha and other ramblers at the back, and single blooms in boxes at front. Mr. George Prince, Longworth, Berks, was a capital second. Third prize went to Messrs. W. and J. Brown, Stamford.

BATH GRAND ROSE SHOW AND GENERAL SUMMER EXHIBITION.
WEDNESDAY and THURSDAY, July 6 and 7.

Classes for Roses, Nurserymen and Amateurs.
Bouquets, Cut Flowers, Sweet Peas, Strawberries.
Plants, and Tuberous Begonias.
Entries close Friday, July 1.

For Prize Schedules, etc., apply
B. R. F. PEARSON, Sec.
Office: 17, Argyle Street, Bath.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY. 22nd Annual Show. SOPHIA GARDENS, CARDIFF. WEDNESDAY and THURSDAY, July 20 and 21st, 1910. Liberal Prizes in every section, amounting in money and plate to nearly £500. Two Programmes of Music each day by His Majesty's renowned 1st Life Guards Band. A Grand Display of Fireworks each evening by Messrs. W. and J. Wilder, Birmingham. Mr. John Studts up to date Fun of the Fair, each day. Tents lighted by the Blanchard Patent Incandescent Oil Lamps. Popular prices. Tickets and Schedules may be obtained from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

DERBYSHIRE AGRICULTURAL AND HORTICULTURAL SOCIETY.

ANNUAL SHOW.
OSMASTON PARK, DERBY,
July 13th and 14th, 1910.

Groups: £20, £15, £12, £8, £5, £4.
Two Gold Medals for Trade Exhibits.
Best Collection of Roses, £5, £3, £2.

Schedules (stating section), and all particulars from
SIDNEY BURTON,
Secretary.
Canal Office, Derby.

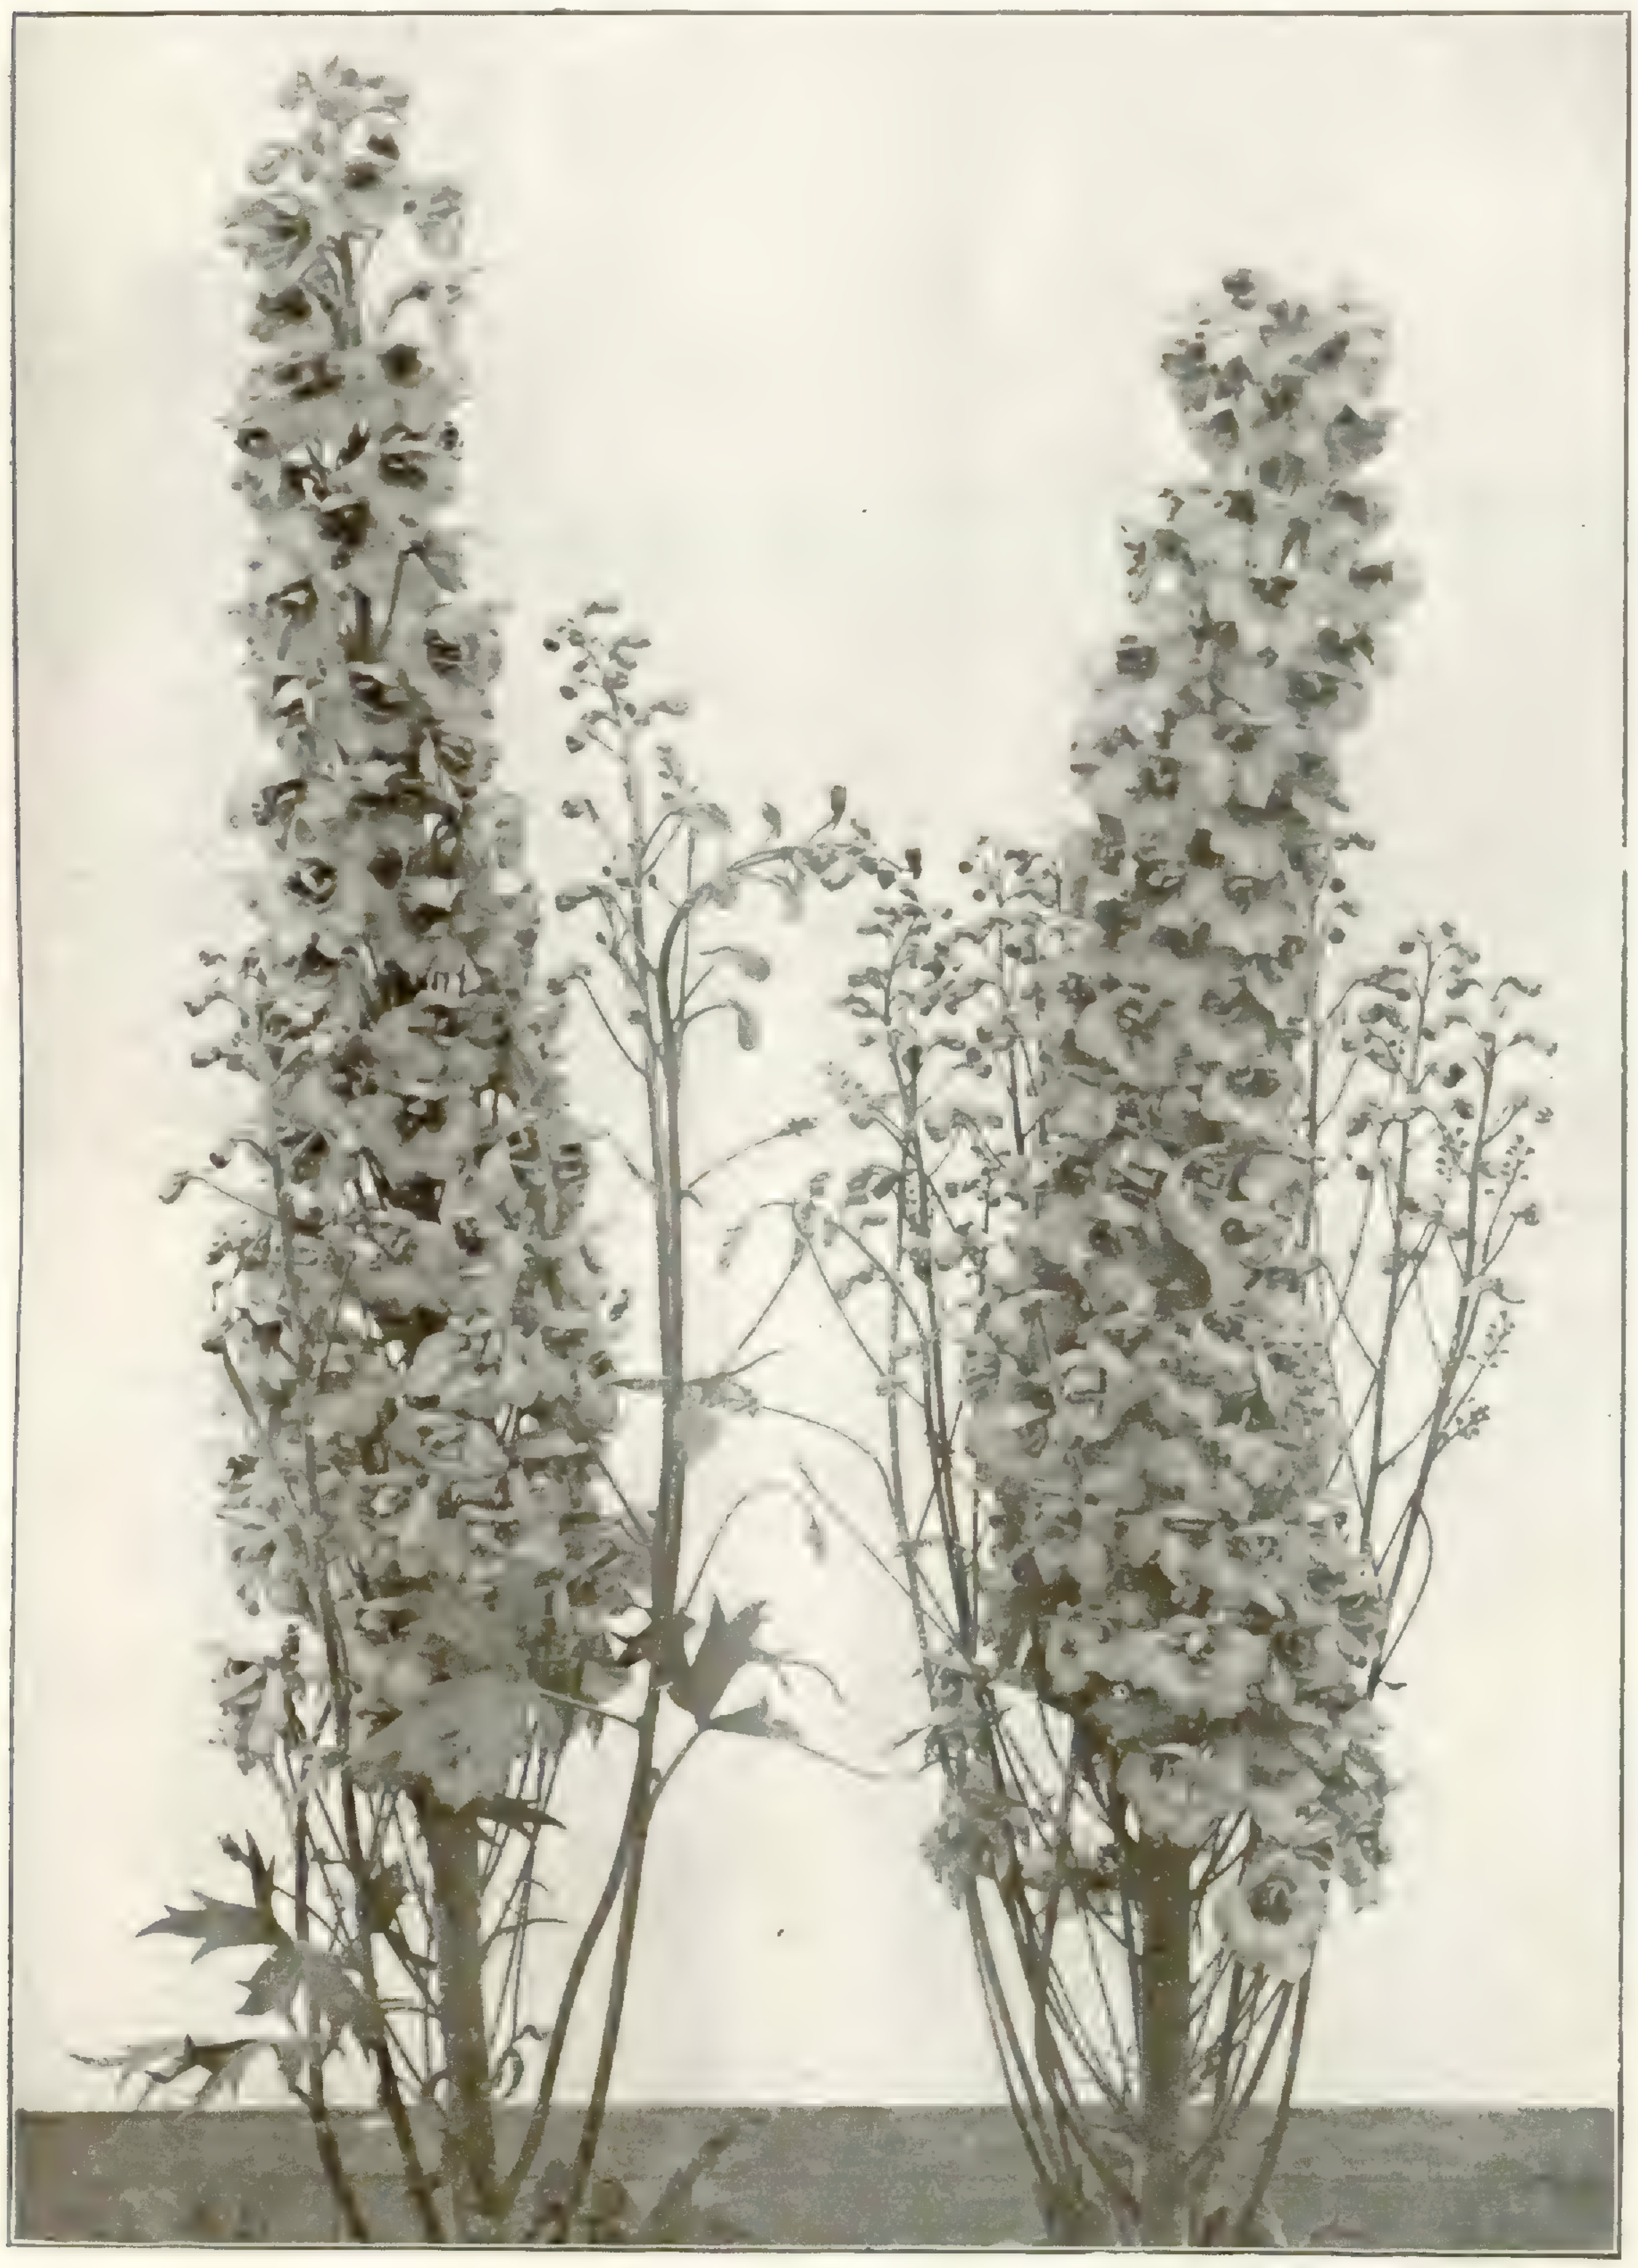
HANLEY PARK, STAFFORDSHIRE.
July 6th and 7th, 1910.

FOURTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes, Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for "TRADE EXHIBIT"
(For particulars see page 10 in Schedule).
Valuable Special Prizes offered by the principal Firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.

Schedules, post free, on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

SUMMER SHOW AT CAMBRIDGE,
July 7, 1910.
OPEN CLASSES FOR ROSES.
Schedules to be obtained of ARTHUR MATTHEW, Hon. Sec., 20, Trinity Street, Cambridge.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.



[Photo: R. Brown, Liverpool.

GREAT FLOWER SHOW AT LIVERPOOL.

Delphinium Imperial Mantle, a splendid variety exhibited by Messrs. J. Kelway and Son, Langport.

Mr. A. F. Dutton, Iver, Bucks, scored in the cut carnation class with a collection of chiefly American and English perpetual flowerers. The salmon shades, such as Winsor, Mrs. H. Burnett, and Fair Maid predominated, but a remarkably fine yellow, called Iver Yellow, claimed one's attention immediately. It is a fine flower, and, it truly perpetual, is worth looking after. Mr. C. F. Waters, Balcombe, Sussex, had beautiful flowers on the second prize stand, and staged a large number of the best varieties in cultivation. The arrangement of colour was also tasteful. Mr. C. Engelmann, Saffron Walden, came third with grand Carolas, but rather a weak foreground to his group.

Some of the finest collections of roses, both cut and in pots, that one could expect to see competed for the gold medal and £5 cash allotted as first prize. The coveted award was secured by Messrs. Geo. Mount and Sons,

Miss Hemus, Upton-on-Severn, received the first prize for an effective arrangement of sweet peas on a table 20ft. by 5ft. Paradise Susiana, a quaint and rather pleasing chocolate flake, and Paradise Apple Blossom, appeared to attract a good deal of attention. Evelyn Hemus was naturally very well shown. Messrs. E. W. King and Co., Coggeshall, were a very close second with a bold and effective arrangement of large vases of the leading varieties. The front of the stand was finished off with three tall arches, decorated with flowers and smilax; Mr. C. W. Breadmore, Winchester, came third.

Messrs. Cypher and Sons again had things all their own way for a collection of stove and greenhouse plants in bloom. They showed a number of huge specimens of ericas, ixoras, anthuriums, etc.

Fruit was not shown in large quantities, but what was staged was of really first-class quality. For eight dishes Mr. James Gibson, gardener to his Grace the Duke of Portland, Welbeck Abbey, won first prize. His dish of Early Rivers nectarine was of exceptional quality and finish. Black Hamburgh and Muscat of Alexandria grapes, James Grieve apple, Brown Turkey fig, Dymond peach, Biggareau de Schreken cherry, and a large seedling melon made up a splendid collection. Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, came second, his grapes being stronger, but the other dishes a trifle below the winner's all through. Mr. E. T. Hazelton, gardener to the Earl of Derby, Knowsley, Prescot, was third.

NON-COMPETITIVE EXHIBITS.

The collection of Japanese pigmy trees growing in ornamental vases, which came from Messrs. Barr and Sons, King Street, Covent Garden, W.C., attracted a great deal of attention. Hardy border and aquatic plants, embracing some of the brightest flowers of the season, were also shown by this firm. A remarkable exhibit for the time of year was a collection of about a hundred dishes of potatoes, staged by Messrs. James Carter and Co., Holborn, London. The tubers, although of last year's growth, were as firm, clean, and fresh-looking as we are accustomed to see at a November show, and were a splendid example of both good culture and careful—indeed, clever—storage. Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, were exhibitors on an extensive scale. They had a fine bank of orchids, a beautifully-arranged collection of perpetual-flowering carnations, and rambler roses.

The liliums, delphiniums, and eremuri provided the boldest features of a glorious bank of herbaceous flowers, well staged by Messrs. R. Wallace and Co., Colchester, while smaller but no less beautiful subjects were heucheras, campanulas, calochorti, and ixias. In fact, it may be said the group was thoroughly representative of the best of the flowers of June. The rare and extremely beautiful Iris albo-purpurea was worthy of note. A few nymphæas, Japanese iris, and spiræas were grouped at the end of the stand. Messrs. Hogg and Robertson, Lim., 22, Mary Street, Dublin, put up a large variety of English and Spanish iris, ixias, and early-flowering gladioli.

Mr. W. J. Unwin, Histon, Cambs, had a lovely lot of sweet peas put up in a very tasteful manner. Mrs. W. J. Unwin was fine, as also was Edna Unwin, but there was a whole host of tip-top varieties. Messrs. E. W. King and Co., Coggeshall, had some very bright peas; the firm always seems to be strong in the scarlet and crimson shades.

The arrangement of the flowers on Miss Hemus' stand showed that dainty touch and lightness which a mere man finds hard to bestow upon his exhibits, and needless to say the quality of the flowers was first-rate. Upton-on-Severn must be a capital place to grow peas, and Miss Hemus takes full advantage of her opportunities. Messrs. Dobbie and Co., Edinburgh, had beautiful aquilegias and a big bank of sweet peas put up with an eye to blending of colour. Dobbie's Sunproof Crimson was again exceedingly fine. Another gorgeous display of pæonies, delphiniums, and irises was brought by Messrs. Dicksons, Lim., Chester. King of Delphiniums caught everybody's eye.

Mr. Edwin Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, came forward once more to show what a wonderful display can be made with vegetables when they are of good strains and cultivated with the skill of a master. Close upon a hundred varieties were put up in that fashion so well known to those who have an acquaintance with this champion's methods of showing. Messrs. R. H. Bath, Lim., Wisbech, once more brought before the public a wonderful array of both double and single pæonies, which were staged in great bunches on a tiered staging. Delphiniums were equally good, the whole range of blue shades being included in the mass of spikes that occupied a considerable portion of the stand. Messrs Jarman's centaureas were shown in the charming varieties so well known as the Chard Farm's speciality.

It was almost a relief as well as pleasure to turn to the restful green of the ferns which were well shown by Messrs. H. B. May and Sons, Upper Edmonton. Davallias, platyceriums, crested scolopendriums, and nephrolepis constituted the chief items in an interesting group. Mr. H. N. Ellison, West Bromwich, also showed ferns in popular and choice sorts, and of a very suitable size for either conservatory or room decoration. The plants for the most part showed that stamina and "hardness" so necessary for the latter purpose. The nymphæas shown by Messrs. Bakers, Wolverhampton, were surrounded by a variety of bog plants, such as Sarracenia purpurea, Mimulus maculosus, and typhas of sorts.

Marvellous is a word that can aptly be used in reference to the huge delphiniums shown by Messrs. J. Kelway and Son, Langport, Somerset. Not only were the spikes immense, but the individual pips were proportionately large, and in all the range of colour from white to indigo there was not a displeasing shade. Pæonies and sweet peas came to support the delphiniums and provide variety. One end of a tent was occupied by Messrs. R. P. Ker and Sons, Aigburth Nursery, Liverpool, who grouped dracænas, crotons, palms, etc., in considerable variety. Notwithstanding the late date, some very fine amaryllis were also shown, the crimsons and scarlets being very brilliant. A semicircular group of kalmias, rhododendrons, and cut-leaved acers was a most attractive exhibit from Messrs. John Waterer and Sons, Lim., Bagshot.

Everybody was delighted with the wealth of roses brought over by Messrs. A. Dickson and Sons, Lim., Newtownards, Ireland. Lady Helen Vincent, Mrs. Fred Straker, and Lady Greenall were all finely shown on bamboo stands, with boxes of older favourites in front. Messrs. Dickson, Brown, and Tait, Manchester, made their vegetables every bit as attractive as the floral exhibits. Colour, form, and size were alike excellent. A rockery of somewhat flat and formal design was built by Messrs. Bees, Lim., Liverpool. The plants which furnished the rockery included many choice and rare alpines, especially primulas. A massive group of very freely-flowered rambler and other roses came from Mr. Wm. Rowland, Childwall Nurseries, Liverpool. The plants were large and good, and the arrangement very effective.

MEDAL AWARDS.

Gold.—Kings Acre Nurseries, Hereford, for fruit trees in pots; Messrs. Dickson, Brown, and Tait, Manchester, for fruit and vegetables; the Hon. Vicary Gibbs, Elstree, for vegetables; Messrs. J. Waterer and Sons, Lim., Bagshot, for flowering shrubs; Messrs. Stuart Low and Co., for orchids, carnations, etc.; Messrs. Alex. Dickson and Sons, Lim., Newtownards, for new roses; Messrs. R. Wallace and Co., Colchester, for herbaceous flowers.

Silver-gilt.—Messrs. Bees, Lim., Liverpool, for rock-work, etc.; Messrs. Dobbie and Co., Edinburgh, for hybrid aquilegias and sweet peas; Messrs. Dickson and Robinson, Manchester, for hardy flowers; Messrs. Hogg and Robertson, Dublin, for bulbous flowers; Messrs. R. H. Bath, Lim., for pæonies and other hardy flowers.

Silver.—Miss Hemus, Upton-on-Severn, for sweet peas; Mr. W. J. Godfrey, Exmouth, for pelargoniums and hardy flowers; Mr. W. J. Unwin, Histon, for sweet peas; Messrs. Dicksons, Lim., Chester, for hardy flowers; Messrs. W. and J. Brown, Stamford, for roses and hardy flowers; Messrs. Barr and Sons, Covent Garden, for pigmy trees.

Certificates.—Messrs. Stuart Low and Co., Bush Hill Park, for a new Bougainvillea Rosa Catalina; Messrs. Blackmore and Langdon, Bath, for Begonias Miss Ethel Gill, Mrs. Lockwood, Mdme. Tetrazini, and Lady Tweedmouth.

GREAT FLOWER SHOW AT LIVERPOOL. [Photo: R. Brown, Liverpool.

New Sweet Pea Mrs. W. J. Unwin, shown by Mr. W. J. Unwin, Histon, Cambs.

NATIONAL VEGETABLE SOCIETY.

The following is the report of the Committee of the National Vegetable Society on the trials of autumn-sown spring cabbages conducted respectively at Twickenham, Middlesex; Sutton Green, Surrey; and Romford, Essex.

AUTUMN, 1909—SPRING, 1910.

In response to the invitation of the committee to various well-known seedsmen, thirty-nine stocks of cabbage seeds were sent in by nineteen diverse firms, as follows:—Messrs. Austin and McAslan, Glasgow; Messrs. James Carter and Co., Holborn; Messrs. Daniels Brothers, Norwich; Messrs. A. Dickson and Sons, Belfast; Messrs. Dickson, Brown, and Tait, Manchester; Messrs. Dickson and Robinson, Manchester; Messrs. Dobbie and Co., Rothesay; Messrs. Hurst and Son, Houndsditch; Messrs. W. W. Johnson, Boston; Messrs. Kent and Brydon, Darlington; Messrs. Pearson and Son, Nottingham; Messrs. Sutton and Sons, Reading; Messrs. James Veitch and Sons, Chelsea; Messrs. Robert Veitch and Sons, Exeter; ; Messrs. Vilmorin-Andrieux et Cie, Paris; Messrs. Watkins and Simpson, Covent Garden; Messrs. Webb and Sons, Wordsley; Messrs. Wheeler and Son, Warminster; and Messrs. Yates and Son, Evesham, to all of whom the committee's sincere thanks are gratefully tendered.

The seeds were all forwarded to Mr. G. Wythes, V.M.H., treasurer, who, with Mr. Owen Thomas, V.M.H., kindly undertook to duly divide, number, and forward them under number only to the respective trial stations. The various designations of the stocks sent were absolutely withheld from all by these gentlemen. The instructions sent to each station were that one portion of each stock should be sown on July 31, 1909, and a second sowing be made on August 14, thus enabling duplicate plantings and trials of each variety to be made. These dates for such purposes were carefully observed, and in each case plantings were performed almost simultaneously so soon as the seedling plants were fit for such purpose. The trial sites were in open fields in very exposed situations, and were conducted on strictly market garden lines. The Twickenham soil was of a fairly retentive loam on a deep base of gravel; that of Sutton Green a very sandy loam on a base of yellow sand; and that of Romford on clay. Distances apart in rows, lengths of rows, thirty plants in each, and general culture were identical, no special treatment having been furnished.

Mr. G. Hobday, of Romford, having reported that on his stiff, wet clay his earliest planting of the cabbages had failed, visits by the trial sub-committee were paid first to Twickenham (Mr. William Poupart's field) on April 21, and to the Times Experimental Farm, Sutton Green, Surrey, on April 22, their observations then made being chiefly limited to the first sowings and plantings for the trials. On both occasions very full notes were taken by the members of each stock, and after careful comparison the following marks and classification, based exclusively on the first sowing or first early merits of each variety, were unanimously agreed to. The members also agreed that, to secure quite early, firm hearts in the spring, sowings of the best varieties should always be made at the end of July or early in August. It is specially worthy of notice that several varieties bolted to flower badly from the first sowing, but evidenced that defect very slightly from the second sowing.

It is interesting to record that the later or August 14 sowing of all the previous-named varieties should have shown in the first place much later hearting and generally much more leafy production, but also that in scarcely a single case did any of the plants bolt to flower. Even those varieties of which, when sown on July 31, every plant bolted, gave not more than 5 per cent., and in some cases not more than 1 per cent., of bolted examples when sown at the later date. None the less, there can be no doubt but that such varieties are better suited for spring than for autumn sowing. Visits to the trials in all three cases, some two to four weeks later, showed that while all those varieties selected as the best and earliest maintained their character, some others were in very good form, though all distinctly later and more leafy. Some two or three varieties were specially so, and hardly merit garden cultivation.

The Romford trial from the second sowing on Mr. G. Hobday's stiff soil practically reproduced the results of the second sowing and planting at both Twickenham and Sutton Green, although growth was perhaps rather more leafy. In every case the trials were most ably, admirably, and impartially conducted.

In presenting this return of the respective merits of each variety, not only in relation to earliness of hearting and to trueness of stock, but also in relation to bolting to flower tendencies, the committee srongly emphasise the importance of securing stocks that are very early hearters, but are also rigidly true in character. Still further, having regard to the fact that no fewer than eleven stocks bolted off to flower prematurely under the earliest conditions of planting, and that several others showed from 5 per cent. to 10 per cent. of bolters, as well as being very irregular in character, seedsmen are strongly advised to specially catalogue all such for spring-sowing only. It would greatly help customers were cabbages classified as small hearting first early, medium hearting or main crop varieties, and if all those which bolt to flower freely from autumn sowings were classed as best fitted for spring sowing and summer hearting. In relation to the two first-named sections, it should be stated that small first early hearting cabbages may be planted as close as 12 inches apart, the breadth being cleared from the ground as fast as cutting proceeds. The second or stronger main crop section should be planted in rows 24 inches apart, as with these the stems can remain to sprout till the following spring.

The committee's warmest thanks are given to Mr. W. Poupart, Marsh Farm, Twickenham, for his great kindness in so admirably conducting his trial; to Mr. Charles Foster, the Times Experimental Station, Sutton Green, Surrey, for similar and most valuable services; and to Mr. G. Hobday, Romford, for his later trial. A special feature in both early trials was found in their great similarity of results. Special and most grateful thanks are due also to Mrs. Poupart, Mrs. Foster, and Mrs. Hobday for generous and welcome hospitality.

The committee desire to mention that the trials of seventy-two stocks of onions sent in by the before-named seedsmen were duly sown under number on August 20 last in long rows, and plants from each row have been litted and replanted in duplicate rows, thus presenting every appearance of providing first-rate trials of bulbs in July next. Similar trials are conducted at Twickenham and at Sutton Green. At the latter place also will be extensive trials of early dwarf peas and early potatoes.—(Signed),

ALEXANDER DEAN, V.M.H. (Chairman).

May 30, 1910.

THREE MARKS OR HIGHLY COMMENDED.

For Special Earliness and Excellence.

First and Best, Messrs. Hurst and Sons, Houndsditch.

Harbinger, April and Flower of Spring, Messrs. Sutton and Sons, Reading.

Ellam's Selected Early and Wheeler's Imprial, Messrs. James Veitch and Sons, Chelsea.

Early Market, Early Feltham, and Myatt's Offenham, Messrs. Watkins and Simpson, Covent Garden.

Wheeler's Imperial, Messrs. Wheeler and Son, Warminster.

Early Evesham, Messrs. Yates and Son, Evesham.

TWO MARKS OR COMMENDED.

All Best Suited for Later Hearting.

Heartwell Marrow and Mammoth Beefheart, Messrs. James Carter and Co., Holborn.

Harbinger (not Sutton's), Messrs. Dickson and Robinson, Manchester.

Milecross Marrow and Improved Excelsior, Messrs. Dickson and Son, Belfast.

Select Early Rainham and Selected Wheeler's Imperial, Messrs. Hurst and Sons, Houndsditch.

Blackwell Early, Messrs. Kent and Brydon, Darlington.

Conqueror, Messrs. Pearson and Sons, Nottingham.

Ellam's Early Dwarf, Messrs. Robert Veitch and Son, Exeter.

Nonsuch, Messrs. Watkins and Simpson, Covent Garden.

Birmingham Market, Messrs. Yates and Son, Evesham.

The following varieties received one mark only: Earliest and Best, First Crop, Flower of Spring (not Sutton's), Emperor and Market Garden.

The following stocks very largely or entirely bolted to flower prematurely from July 31 sowings: Express, Model, Early Garden, Little Queen, Early Conical, Early Express, Earliest Excelsior, Earliest of All, Paris Market, and Express Extra Early.

The following lists are specially appended by Mr. Charles Foster of the Times Experimental Station, Surrey, as indicating the results of his observations of the growth of each variety from the later sowings and plantings on his sandy soil.

Extra early hearting for early August sowing and September planting. Recommended to be grown 1 foot square. Varieties: Ellam's Early Dwarf, Sutton's April, Veitch's Selected Ellam's, Birmingham Market (Yates), Early Market (Watkins and Simpson), Harbinger Extra Early (Sutton), Wheeler's Imperial, Improved Excelsior (Dickson's), Early Rainham (Hurst and Son), Johnson's First Crop, Conqueror (Pearson), Early Offenham (Watkins and Simpson), and Blackwell Early (Kent and Brydon).

Early hearting for August sowing, medium size, for planting 18 inches square. Varieties: Heartwell (Carter's), Beefheart (Carter's), Milecross Marrow (Dickson), Johnson's Market Garden, First and Best (Hurst, Early Evesham (Yates), Nonsuch (Watkins and Simpson), Early Feltham (Watkins and Simpson), Flower of Spring (Sutton and Sons), Emperor (Webb and Sons), Earliest and Best (Dickson and Robinson), and Harbinger (Dickson and Robinson).

The following varieties are recommended for spring sowing or for autumn sowing after August 14 in the South of England. Sown on or after August 14. These are, May 19, excellent in every way, good hearts, and very even stocks, equal to the best of the other varieties sown on the date named. They are worth three marks, being compact in growth with conical hearts. Carter's Model, Extra Early Express (Vilmorin), Earliest of All (Veitch, Exeter), Dobbie's Earliest, and Little Queen (Daniels).

The following varieties were not so good, with outer leaves more spreading: Early Garden, Early Conical, Excelsior, Paris Market, and Early Express.

FORTHCOMING ENGAGEMENTS.

MONDAY, June 27.—Isle of Wight Rose Show at Ryde.
WEDNESDAY, June 29.—Richmond Flower Show.
THURSDAY, June 30.—Birmingham Rose Show.
SATURDAY, July 2.—Windsor Rose Society.
  Sutton Rose Show.
  Warminster Rose Show.
  French Horticultural Society of London.
MONDAY, July 4.—Chingford Horticultural Society.
TUESDAY, July 5.—Holland House Show; Two days.
  Southampton Rose and Sweet Pea Show; Two days.
  Brighton Rose and Sweet Pea Show; Two days.
  Southend Horticultural Society; Two days.

British Gardeners' Association (London Branch).—We are requested to announce that the outing which had been fixed for to-day (Saturday, June 25) has been postponed.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

SPORT FROM PELARGONIUM CLORINDA.—A. A., Hungerford: The sport is a pretty one, and is well worth propagating. If it grows and flowers as freely as the parent it should have a commercial value, as many people would prefer the colour of the sport to that of P. Clorinda.

SWEET PEAS.—W. H., Letchworth: You will find all the information you need in connection with the exhibition of sweet peas in "Sweet Peas and Their Cultivation," to be obtained for 1s. 2d., or 1s. 8d. post free, from the Gardeners' Magazine office, 148, 149, Aldersgate Street, E.C.

STRAWBERRY FOR NAME. — O. E., Chirbury: The fruits did not reach us in a fit state for naming. They were of enormous size, and gave evidence of exceptionally good culture; the bright outer colour, and pale flesh, suggest Royal Sovereign, but we assume you are quite familiar with this popular variety. Whatever the variety may be it is evidently a fine one under your system of culture, provided the flavour is as good as the appearance of the fruits. Fruits and flowers for name should always be sent to us at Endsleigh, Priory Park, Kew.

SECOND STEM TO TOMATOES. — R. L., Norwich: It is not the usual custom to allow tomatoes to develop a second stem, but we have seen it done with considerable success on at least two occasions. In the one case it was in Mr. Murgatroyd's garden at Chelmsford, and in the other at The Hendre Gardens, Monmouth, where Mr. T. Coomber is head gardener. Mr. Coomber used to train up a growth from the base of each plant as soon as a few trusses of fruit were swelling away freely and beginning to ripen; as the fruits on the original single-stemmed plant were removed the secondary growth advanced, and, in turn, produced flowers and fruits. The leaves on the first stem were removed or reduced so as to secure all the light possible for the second stem. Whether Mr. Coomber practises this method now we do not know. If the crop has to be cleared out in autumn to make room for other things it would be inadvisable to train up the second growth. Good feeding is obviously necessary is such a case of double cropping.

PLANTING OUT BOUVARDIAS. — B. A. N., Chertsey: The present is a good time to plant out bouvardias. The site must be a sheltered and sunny one, and the soil rich and well-drained. Provide sufficient water all through the summer, and pinch out the growing points twice to secure bushy growth. In the autumn cut round the roots with a clean sharp spade, and a few days after lift and pot the plants carefully. Shade for a few days, and place in a greenhouse, where a temperature of 55 degrees can be maintained easily in cold weather. Under these conditions bouvardias flower very freely, and over a long period.

WEEPING TREES.—C. C., Winchelsea: Weeping trees add considerably to the attractions of a garden by reason of their grace. At this season of the year such trees are to be seen in full beauty, and a visit to a large public or private garden where trees and shrubs are a feature should be made for the purpose of deciding which kinds would be most suitable for you. The birches give us two elegant weeping trees, one known as Young's Weeping (Betula alba pendula Youngi), and the other as the Cut-leaved Weeping (B. alba incisa pendula). The Weeping Beech (Fagus sylvatica pendula) is very desirable, as also is the Fern-leaved Beech (F. sylvatica asplenifolia), which is of erect growth and extremely elegant. The Weeping Ash (Fraxinus excelsior pendula), Weeping Elm (Ulmus montana pendula), the Scampston Weeping Elm (U. americana pendula), Weeping Lime (Tilia argentea pendula) can all be strongly recommended, and should be selected according to the class of tree preferred. There are several weeping willows, and of these the Common Weeping Willow (Salix babylonica) is the best for planting on the margins of lakes or ponds or by the side of streams, and the American Weeping Willow (S. purpurea pendula) for dry positions.

FEEDING PEACH TREE.—L. E. C., Lichfield: Give the root area a thorough soaking with clear water that has been aerated, and twenty-four hours later give liquid cow manure in quantity, and mulch the soil with half-rotten manure. Remove useless growths, but not all at once, and train in the shoots that are to provide the fruiting wood for next season.

AMARYLLIS. — E. J. J., Tamworth: There is no special difficulty in raising a stock from seed, but as the seedlings do not bloom until the third season from the time of sowing, the preferable course is to commence their cultivation by purchasing bulbs of seedlings or named varieties that have reached a flowering size. The bulbs should each year remain in the pots in which they were flowered until January, and then be shaken out and repotted, six-inch pots being the most suitable for flowering bulbs of average size; for rather small bulbs five-inch pots will be sufficient; while for those of extra size pots seven inches in diameter will be necessary. Use a compost consisting of turfy loam six parts and one part each of well-rotted cow manure, leaf-mould, and coarse sand. The pots must be well drained, and the bulbs should be buried to rather more than one-half their depth, and have the soil pressed firmly about them. For flowering during the spring months, when they are of the greatest value, they may be started at any time between January 1 and March 1; but the best plan is to divide the stock into three portions, and start one batch early in January, and others in February and March. A temperature between 55 deg. and 60 deg. will be the best for starting them into growth, and very little water should be given them until they are growing freely. When the flower stems have attained their full length, and the buds are beginning to expand, remove them to a warm position in the greenhouse, place near the glass, and give an occasional supply of weak liquid manure. It is essential to give the bulbs careful attention after they have flowered to ensure the completion of the season's growth.

LYCASTE SKINNERI.—A. P. S., Rotherham: If the plants are thoroughly established, and the soil and drainage are in good condition, you may give them a watering with weak liquid cow manure once a week throughout the summer season.

COCKROACHES IN CONSERVATORY.—M. A. R., Reigate: The various patent contrivances for capturing cockroaches are of great value, and should be used in conjunction with other homely remedies. The great thing in dealing with an invasion of cockroaches or any other pest in glasshouses is persistence over a considerable period, as by this means the several generations are secured, and the plague stamped out. A good remedy is arsenic and honey well mixed together, and placed in small quantities on bits of crock or glass in their haunts. Oatmeal and honey are a good bait, adding one and a-half ounce of arsenic to a pound of oatmeal, putting it on pieces of crock or in oyster shells, and laying them where the marauders congregate. We have seen many

CAMPBELL'S PATENT
SULPHUR VAPORISER.

An apparatus for **Vaporising Sulphur in Greenhouses to destroy Mildews and other Diseases affecting Roses, Vines, Chrysanthemums, Tomatoes, Cucumbers, Peaches, etc.; also for checking Red Spider.**

The apparatus is one of the grandest inventions ever introduced for the benefit of cultivators under glass, and hundreds of Testimonials from all parts of the world confirm this. It lasts for years, and costs retail, for small amateurs' size, **12s.**; large size, **16s.**

TENNIS COURT BORDER NETS, good colour, especially prepared, with strong line attached to net at top and bottom; easy to erect or take away; will not rot, can be left out in all weathers; 25yds. by 2yds., 6s. 6d.; by 3yds., 7s. 6d.; by 4yds., 8s. 6d.; any size made. Standards for same, 10ft. high, 1s. each. Garden Netting, 30 sq. yds. for 1s. Orders over 5s. car. paid. List of Fancy Tents free. H. J. GASSON, Net Works, Rye. Est. 126 years.

caught by placing on the floor a basin of water, putting a few strips of laths against them, and sprinkling a little oatmeal on them. The beetles run up the laths and drop into the water. Stale beer is of great use in trapping these pests, and a good plan also is to use phosphorous paste, but in all remedies of this kind be careful not to put them where household pets are likely to think them harmless eatables and be poisoned in consequence.

NAMES OF PLANTS.

B. C., Guildford.—Romneya Coulteri.

O. L. S., Doncaster.—1, Oncidium macranthum; 2, Odontoglossum pulchellum.

Hortus, Whittlesea.—1, Geranium ibericum platypetalum; 2, Armeria cephalotes.

F. B. W., Selby.—1, Odontoglossum crispum; 2, Epidendrum prismatocarpum; 3, Impatiens Sultani.

A. D., Helensburgh.—1, Coprosma Baueriana; 2, probably Liriodendron tulipifera; 3, Kalmia angustifolia.

R. N. V., Huntingdon.—1, Philadelphus coronarium; 2, Cytisus scoparius Andreanus; 3, Tilia argentea.

N. T., Ipswich.—1, Pelargonium Clorinda; 2, Helxine Solieroli; 3, Lupinus polyphyllus; 4, Monstera deliciosa; Cupressus Lawsoniana erecta viridis.

G. R. G., Stroud.—1, Haberlea rhodopensis; 2, Torenia Fournieri; 3, Mimulus luteus; 4, Kolreuteria paniculata; 5, Kerria japonica fl.-pl.; 6, Aristolochia Sipho.

S. R., Swindon.—Odontoglossum citrosmum; we see by the photograph you have staked the spikes upright; they would have looked much better hanging down naturally.

TRADE NOTE.

As supplementary to our full and freely-illustrated account of some of the more noteworthy of the gardens in the Dukeries, we would mention as a matter of additional interest that the fine range of fruit houses which constitute so important a feature of the Clumber gardens, were built by Mr. James Gray, of Chelsea; also that the ranges of fruit and plant houses at Rufford Abbey, in which Mr. Doe achieves such successful results in fruit and plant culture, were erected by Messrs. Mackenzie and Moncur.

ROSES IN BLOOM.

WM. PAUL & SON, beg respectfully to announce that the collection of roses, including the new Waltham Cross varieties, Alice Cory Wright, Bianca, Juliet, Portia, and others not to be seen elsewhere, is now in bloom at the Waltham Cross Nurseries, and will continue in greater or less perfection throughout the Summer and Early Autumn. The Nurseries are open from 9 a.m. to 6 p.m. (Saturdays, 5 p.m.); admission free on presentation of address card. A fine collection of Hardy Trees and Shrubs, Fruit Trees and Herbaceous Plants is also now in full beauty.

They also beg to call the attention of visitors to the Japan-British Exhibition to the **WALTHAM CROSS ROSERY** now in bloom, consisting of several thousands of plants situated in the Elite Gardens in the centre of the Exhibition grounds, immediately in front of the principal restaurant.

NOTE.—A fine stock of **ROSES IN POTS** of both old and new varieties for present planting and pot culture is now available. Priced descriptive Catalogue free on application.

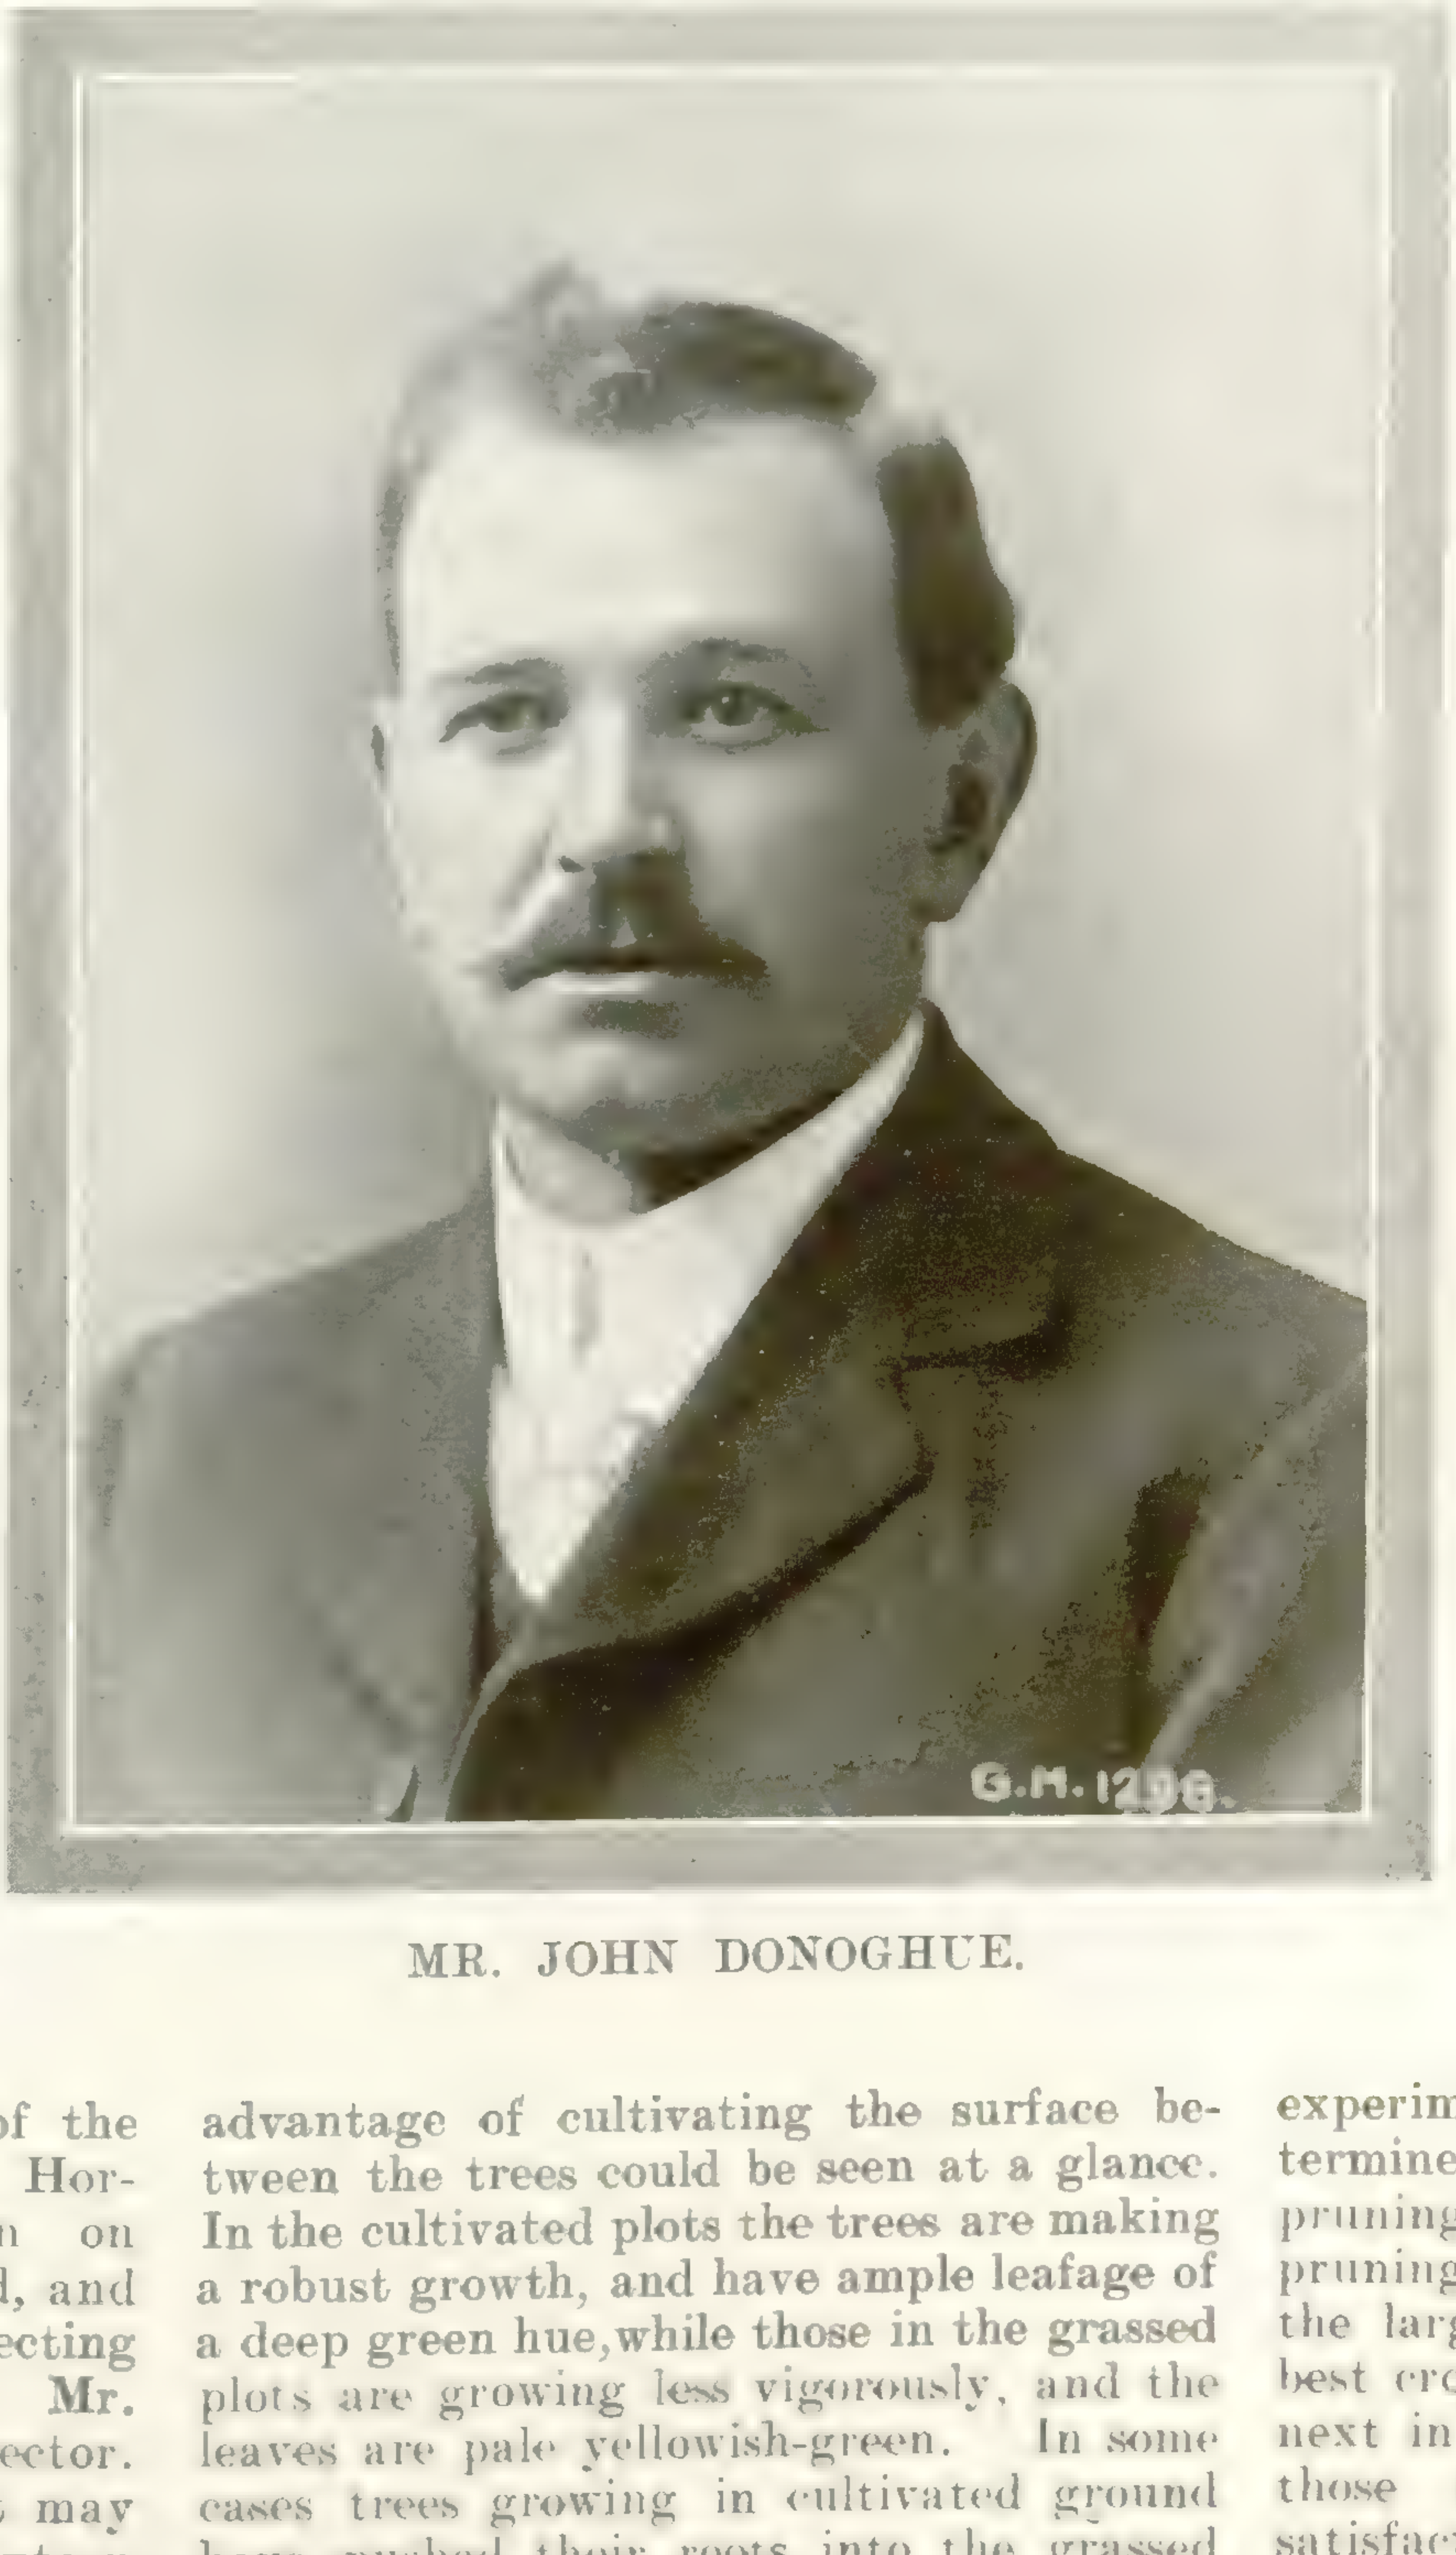
NOTE OF THE WEEK.

◆

Experiments in Fruit Culture.

The value of experimental work in the solution of problems that perplex cultivators, and in testing the soundness of theories having relation to the production of fruit and vegetable crops cannot well be overestimated. But to be of service experiments must be conducted on strictly scientific lines that all sources of error may be eliminated; and extend over a sufficient period to give really definite results. If experiments are carefully carried out, and they are not worthy of consideration unless that be the case, their value is not to be measured by increased crop production. They are equally valuable whether the results show that by following a certain course of procedure a manifest improvement in the crop will be effected, or whether the crop will be unsatisfactory in quantity or quality. This point is sometimes overlooked, and at the gathering of horticulturists at the Woburn Experimental Fruit Farm on the 23rd ult. some of those present did not appear to so fully appreciate the importance of experiments that showed the cultivator what he should avoid, as of those which proved to demonstration that by following a certain course of procedure a larger measure of success may be achieved. This manner of regarding experimental work should, as far as possible, be avoided, for not until the whole of the lessons it is capable of teaching are mastered is it possible to obtain full advantage from them. The party, which consisted of members of council and of the standing committees of the Royal Horticultural Society, visited Woburn on the invitation of the Duke of Bedford, and had an opportunity of leisurely inspecting the farm under the guidance of Mr. Spencer Pickering, F.R.S., the director. This experimental fruit farm was, it may be mentioned, established about sixteen years ago by the Duke of Bedford for the purpose of solving some of the more difficult problems in fruit culture, and of assisting those of the tenants on the Woburn estate who were in need of information on the planting and management of orchards. Neither the position nor the soil are particularly favourable to fruit culture, but this fact, while it may have somewhat hampered Mr. Spencer Pickering in his experiments, has not appreciably diminished the value of what has been accomplished. The first of the experiments to which the attention of the visitors was directed was that devised for the purpose of testing the effect produced by grass on both garden and orchard trees. The difference in the condition of the trees in the cultivated and grassed plots was so marked that the advantage of cultivating the surface between the trees could be seen at a glance. In the cultivated plots the trees are making a robust growth, and have ample leafage of a deep green hue, while those in the grassed plots are growing less vigorously, and the leaves are pale yellowish-green. In some cases trees growing in cultivated ground have pushed their roots into the grassed area, and these show signs of injury, but to a much less extent than those growing in an area that is wholly grass covered. Strenuous endeavours have been made at Woburn to determine the cause of the injury, but so far they have not proved successful. It has been proved by experiments extending over a considerable period that it is not due to the grass depriving the trees of either food or water, or preventing the air passing down to the roots. Trees with grass growing about them that have had additional supplies of food and water conveyed to their roots by means of underground pipes were in practically the same state of health as the grassed trees that had not received additional assistance. That the injury has not been caused by the grass depriving the roots of air has been proved by enclosing the roots in bottomless cylinders some four or five feet in diameter, and covering the surface with a layer of cement. These have been artificially supplied with food and water, and are more healthy in appearance than neighbouring trees with grass growing about them. Experiments are still in progress, and Mr. Spencer Pickering is inclined to the opinion that the injury done by the grass is due to its toxic effects. The determination of the point will be of great scientific interest, but sufficient has been proved to demonstrate that there is an immense advantage in growing hardy fruits in cultivated ground, a fact that should not be lost sight of by cultivators. The experiments in pruning are of much interest, especially as they have given definite results. It has been proved that shortening the shoots of newly-planted trees to about two-thirds their length before growth commences in spring has an important influence upon their welfare. This is, of course, what would be expected by experienced fruit growers; but few would have anticipated the results that have been obtained in pruning established trees. In the experiments conducted with a view to determine the relative advantages of severe pruning, moderate pruning, and non-pruning, the unpruned trees have attained the largest dimensions, and produced the best crops of fruit, those moderately rank next in growth and productiveness, while those severely pruned are the least satisfactory. In the case of the plots of Bramley's Seedling Mr. Spencer Pickering stated that, taking 100 as the value of the crop of the severely pruned trees, the value of the crop of those moderately pruned was 131, and of the unpruned trees 150. In favourable seasons the fruits set so freely on the last-named that thinning was necessary to ensure their attain-



MR. JOHN DONOGHUE.

ing full size, and the practice that had been adopted with success was to thin to two fruits to each cluster. There was no marked difference in the appearance of the unpruned and the moderately pruned trees, except that the branches of the former are rather crowded. It was surprising to find as the result of the manurial experiments that manures, whether artificial or natural, have had no effect on the growth and the cropping of the apple trees throughout the past fifteen years. With bush fruits growing in the same plots the difference has been considerable, and in the sandy soil in a small experimental station in the village of Millbrook the apple trees have derived considerable benefit from manurial dressings. The lesson to be derived from the results obtained at Woburn is the importance of carefully adapting the method of procedure to the conditions that obtain. The effect of ramming the soil when planting is everywhere evident, for the results obtained in the earlier experiments in planting were so unexpected that not until at least two thousand trees had been planted was Mr. Spencer Pickering satisfied as to there being no possibility of error.

Mr. John Donoghue, whose portrait we have great pleasure in presenting to our readers in this issue, is known by reputation to most of our readers, as he has contributed calendarial notes to our pages. In the North of England, Yorkshire especially, Mr. Donoghue is well known as a clever plantsman and a successful competitor, and our records of the York Gala shows of the past few years prove that in the arrangement of an artistic group and the display of carnations in pots he is rarely beaten. Mr. Donoghue began his gardening career at Woodthorne, the residence of Lord Wolverhampton, and passed on to Vale Head and Old Springs Hall at Market Drayton. He subsequently became foreman under Mr. Harman, at Newnham Paddox, Rugby, the residence of the Earl of Derby. Here he stayed some time, and the opportunities for continuing his studies in landscape gardening, forestry, etc., were taken full advantage of, Mr. Harman, who is also a lecturer in horticulture for the Warwick County Council, rendering him all possible assistance. After a short stay at the Messrs. Dicksons', Chester, Mr. Donoghue went as carnation grower under Mr. Leadbetter, at Tranby Croft, Hull, and subsequently became general foreman at this famous establishment, occupying that position for seven years, and further adding to his knowledge of landscape gardening and forestry, as well as the general routine of a well-kept garden. Mr. Donoghue gives a full meed of praise to Mr. Leadbetter and Mr. Harman for the kindly and practical interest they take in the young men under them; that he himself has profited by their advice and help is proved by the position he now holds as head gardener to Joseph Pickering, Esq., at Bardon Hill, Weetwood, Leeds. Mr. Pickering is a keen lover of all gardening, and a liberal supporter of horticultural movements. Mr. Donoghue secured a Second Class Certificate at the R.H.S. examination in 1901, and a First Class in the following year; he has won numerous prizes for essays in competitions at Hull, Hessle, and the East Anglian Horticultural Club, and at York Gala he has won three first and two second prizes in the large group class, and six firsts for a group of carnations, during the last five years.

Royal Patronage for the Royal Horticultural Society.

Our readers, and especially those who are Fellows of the R.H.S., will learn with much pleasure that their Majesties King George V. and Queen Mary have consented to become patrons of this society.

International Horticultural Exhibition, 1912.—It has been decided by the executive committee that the International Horticultural Exhibition, to be held in 1912, shall extend over eight days, and the opening has been fixed for May 22. The eight days will include Whit Monday, and an opportunity will be thus afforded the masses to visit the show. The committee have obtained the option of a site for the exhibition in the west of London.

Visit of Horticulturists to Woburn.—On Thursday, June 23, on the invitation of the Duke of Bedford, a large party of horticulturists, comprising members of the council and committees of the Royal Horticultural Society, visited the experimental fruit farm, which was established sixteen years since on the Woburn Estate. The party included Sir Albert Rollit, Professor Bateson, Mr. J. Douglas, Mr. J. Willard, Mr. C. E. Shea, Mr. C. Foster, Mr. A. W. Hill, Mr. George Gordon, Mr. C. R. Fielder, Mr. S. T. Wright, Mr. O. Thomas, Mr. W. Bates, Mr. Davis, Mr. A. H. Pearson, Mr. Gaskell, Mr. Reader, and other prominent horticulturists that are associated with the Royal Horticultural Society and its work. Mr. Spencer Pickering, the director, met the party on arrival at Ridgemont, and, proceeding at once to the experimental fruit farm, he explained with remarkable clearness the experiments now in progress, and showed the results of those that had been completed. After devoting two hours or so to an inspection of the experiments, a break was called, and the members of the party were driven to Woburn Abbey, where they were entertained at luncheon. On the way to the Abbey the party passed along one of the magnificent grass drives that form so fine a feature of the park, and the stately cedars and other coniferous trees, and the glorious masses of rhododendrons were much admired. A hearty vote of thanks was, on the proposal of Sir Albert Rollit, accorded to the Duke of Bedford for his generous hospitality, and to Mr. Spencer Pickering for his contribution to the success of the visit. The luncheon was followed by an inspection of the priceless treasures of art that abound in the stately edifice, and after a walk through the pleasure grounds, carriages conveyed the party through another part of the park to enable the members to see the many rare birds and curious animals for which Woburn Abbey is famous. A further inspection of the fruit farm followed, and this was continued with unabated interest until the hours for tea and entrain were called.

Holland House Show.—This great exhibition, which will be held on Tuesday and Wednesday next, has the promise of proving an exceptional success, and is of much interest from the fact that it is understood this will be the last time the Royal Horticultural Society's summer show will be held in the grounds of Holland House. We shall give a full and illustrated report of the exhibition in our next issue.

Saughton Park is the latest addition to the public parks and gardens of Edinburgh, and it possesses so many attractions that it has the promise of becoming highly popular. The grounds and mansion of Saughton Park were purchased several years since by the Corporation of the City of Edinburgh for the purpose of a public park, but the Edinburgh International Exhibition was two years since held in the grounds, which somewhat delayed their being opened for public use. The old hall and grounds are situate on the banks of the Water of Leith, and the latter have been altered and greatly improved under the direction of Mr. J. McHattie, the able chief of the Public Parks Department. Among other attractive features that have been added to the park are an azalea and rhododendron garden, a rose garden, a rock garden, and a flower garden in the Italian style.

The Rose Season.—Writing with reference to the metropolitan exhibition of the National Rose Society, which will be held in the gardens of the Royal Botanic Society on Friday next, Mr. Edward Mawley, the hon. secretary, expresses the opinion that the display of roses will be of quite exceptional excellence. In justification of his opinion, he says, "In most localities there has been plenty of rain, and as a rule moderate temperatures have prevailed, both of which conditions favour the gradual development, and consequently the increased size and perfection of the blooms. Then, again, the season being an early one, and the date of the show later than usual, all the earliest blooms, which are generally inferior owing to late frosts, etc., will be over, and those which follow—generally the choicest of the year—will be available. These two circumstances will also allow of roses from all parts of the country being more generally represented than in recent years, when the fixture has been earlier and the season unusually late."

Rothamsted Experimental Station.—A meeting of the Society for Extending the Rothamsted Experiments was held at Rothamsted on June 16, under the presidency of the Duke of Devonshire. The society has been incorporated with the object of obtaining additional funds for the development of the agricultural investigations which have been carried on so long under the late Sir John Lawes and the Lawes Agricultural Trust, which he afterwards founded. The immediate object of the society is to obtain a sum of £5,000, in order to secure about 200 acres of land adjoining the present experimental fields, and erect thereon the buildings required for feeding experiments with the crops under investigation. An appeal for subscriptions towards thus securing a small, self-contained farm for the Rothamsted Experimental Station is now being circulated, and at the meeting of the society a first list of donations was reported from the Duke of Devonshire, Lord Iveagh, Sir J. T. Brunner, Colonel E. H. Carlile, M.P., Mr. J. F. Mason, M.P., and Mr. J. Martin White, amounting to £1,450.

Committee on Agricultural and Horticultural Science.—The President of the Board of Agriculture has appointed a Committee to advise the Board on all scientific questions bearing directly on the improvement of agriculture and horticulture, and especially as to the methods to be adopted (a) for promoting research in universities and other scientific schools; (b) for aiding scientific workers engaged in the study of agricultural and horticultural problems; and (c) for insuring that new scientific discoveries are utilised for the benefit of cultivators. The Committee includes Professor J. B. Farmer, F.R.S., Mr. P. Spencer Pickering, F.R.S., and Lieut.-Col. David Prain, C.I.E., F.R.S. Mr. T. H. Middleton, M.A., will act as chairman of the Committee, and one of the officers of the Intelligence Division of the Board will act as secretary.

Expensive Raspberries. — We learn that a few raspberries from France, the first offered this season, arrived in Covent Garden on Saturday last, and sold for 6s. per lb.

The National Chrysanthemum Society's outing will take place on Monday, July 25, to Tring Park, Herts, by kind permission of Lord Rothschild. The inclusive charge for the outing, fares, lunch, tea, etc., is 10s. 6d., and tickets may be obtained from Mr. Richard A. Witty, 72, Savernake Road, Gospel Oak, N. The party will leave Marylebone Station at 9.20 a.m., and, on reaching Wendover, will travel by brakes through some of the most beautiful scenery in Herts and Bucks. Before lunch the Hon. Walter Rothschild's famous museum will be visited, and after luncheon the members of the party will inspect the gardens and grounds of Tring Park. The party will travel from Tring to Wendover by a different route to that followed on the outward journey, and will leave Wendover at 9.7 p.m., arriving in London at 10.8 p.m.

David Thomson Memorial Fund.—We have been asked to state that it has been decided to close this fund on July 16, and that those who are still desirous of subscribing are requested to send their contributions before that date to either of the following: Mr. Harry J. Veitch, V.M.H., Treasurer of the Gardeners' Royal Benevolent Institution, Royal Exotic Nursery, Chelsea, S.W.; Mr. James Whytock, President of the Scottish Horticultural Association, The Gardens, Dalkeith Palace, N.B.; Mr. J. W. McHattie, Vice-President of the Royal Caledonian Horticultural Society, Public Parks Office (City Chambers), Edinburgh; Mr. George Monro, V.M.H., Covent Garden Market, London, W.C.; Mr. J. H. Goodacre, V.M.H., The Gardens, Elvaston Castle, Derby; Mr. W. Henderson, The Gardens, Balbirnie, Markinch, N.B.

National Sweet Pea Society.—The outings that have been arranged by the National Sweet Pea Society for the forthcoming season are as under: On Thursday, July 14, the society's trials of sweet peas at the Times Experimental Station, Sutton Green, near Guildford, will be inspected, and the inspection will be followed by a visit to the beautiful grounds and gardens of Sutton Place, very kindly thrown open to members on this occasion by Lord and Lady Northcliffe. On Friday, July 15, there will be an outing to Messrs. Hurst and Son's trial grounds at Fering, Kelvedon, Essex, on the invitation of the president, N. N. Sherwood, Esq., V.M.H., and to Messrs. Dobbie and Co.'s nurseries at Mark's Tay.

Birds Caught in Fruit Netting.—A lady correspondent writes from Liverpool: "Will you allow me to suggest to the bird lovers among your readers that, during the summer season they should make a point of periodically visiting their fruit nets, and so ensure against such of our little songsters as may have been caught there dying a slow death from hunger and thirst. It is a quite common thing to find the dead body of a bird entangled in the meshes of a strawberry net, and one does not like to think of the lingering death by which the little thief has atoned for his very natural greediness."

Prizes for Hyacinths.—The Council of the Royal Horticultural Society have accepted the offer of a series of prizes for hyacinths from the General Dutch Bulb Growers' Society at Haarlem. The prizes will be offered for competition at the Royal Horticultural Society's meeting on March 14 and 15, 1911. The classes that will be open to amateurs will be for eighteen, twelve, and six hyacinths, distinct, in pots, and for four pans each containing ten bulbs of one variety. The blooms of each pan are to be of a distinctly different colour to those of the other three pans. Two classes are set apart for trade growers, and one of these is for one hundred hyacinths in twenty-five named varieties, four bulbs of each variety, grown in pots or glasses, and the other is for twelve pans of hyacinths, distinct varieties, each pan containing ten bulbs of one variety.

Sir Albert Rollit.—We notice in a recent number of "Le Chrysanthème" a portrait of the highly-respected president of the N.C.S., together with an appreciative biographical notice. Sir Albert's services to horticulture, but particularly his work in connection with the chrysanthemum, from the day when he opened the first Hull Chrysanthemum Show, are fully dealt with.

A BEAUTIFUL GROUP OF ORCHIDS AND FINE-FOLIAGE PLANTS.
Exhibited by F. Menteith Ogilvie, Esq., at the Oxford Commemoration Show, of which a report appears on page 517.

AN ATTEMPT TO INTRODUCE OLEARIA SEMIDENTATA INTO THE BRITISH ISLES.

The following interesting article, written by Captain A. A. Dorrien-Smith, we reproduce from the "Kew Bulletin," by permission of the Comptroller of His Majesty's Stationery Office. We may add that Captain Dorrien-Smith brought home many interesting plants from the Chatham Islands to the Scilly Islands, but very few have survived:

"I left Lyttelton, New Zealand, on December 1, 1909, at ten p.m. in a small steamer capable of steaming about nine knots under very favourable circumstances, in order to cover the 476 knots of Southern Pacific Ocean which separates the Chatham Islands from the main land. Our course lay about E. by N., and from the very start we met a strong head wind which lasted more or less the whole way across, but, after a good bucketing lasting three days twelve hours, we at last sighted through the mist some land rising sheer out of the sea and arrived soon afterward in the Port of Weitangei. It was a dull, thick, misty day when we arrived, and it soon turned into deluges of rain. As we approached the small wharf and let go the anchor in three and a-half fathoms of water, just outside the kelp and within a biscuit-throw of the cliff, I noticed that we had steamed into a very large bay surrounded by sand dunes. At first the place seemed deserted; but presently people began to arrive, a few on foot, but most on horseback, and as far as the eye could see came knots of cantering horsemen along the beach accompanied by a swarm of dogs, each man or woman seemed to have at least six, until at last there must have been 60 or 70 horses and about 300 dogs all collected on the beach to await the landing of the mails, etc.

"Captain Allsop, who commanded our vessel, and who had been most kind to me on the voyage across, kindly introduced me on landing to the inhabitants of the place. Everywhere I was most hospitably received and everyone was anxious to learn my mission and what they could do for me, a point which I was not long in explaining; so having secured a room at Mr. Odman's hotel on the beach (there are two hotels) I was directed to Mr. F. A. D. Cox's house some two miles off and kindly lent a horse to get there. I had been in communication with Mr. Cox for some years, through the kindness of Dr. L. Cockayne and others, and as he is the living authority on the Chatham Island flora I was most anxious to meet him. After fording the Weitangei river at its mouth and then crossing the sand dunes, my way lay across a fine grass flat, which comprises the race course, and beyond this, on some rising ground a short distance further, I came to the house, Whangamarino, where I was most hospitably received, and where I eventually stayed for the remainder of my visit to the islands.

"The Chatham Islands are composed of two large islands and several rocks and islets. Chatham Island itself is by far the largest, with an area of about 230,000 acres or about thirty miles long, and Pitt Island of about 15,000 acres; they lie on either side of 44 deg. S. lat., some small islands of the group being known as the Forty-fours. They were inhabited in the early days of European settlement in New Zealand by the Moriori, a peaceful black race practically unversed in the art of war, until the Maoris came and ate them. I believe only nine remain at the present day.

"Dr. L. Cockayne in the Trans. N.Z. Inst., vol. xxxiv, gives a very good account of these islands and special reference should be made to his paper for an account of their flora.

"I found during my visit that the climate is particularly 'soft,' indeed, from the statistics collected by Messrs Cox and Shand, the average rainfall seems only to be about 30 inches, while it 'damps' on an average, 190 days in the year. The temperature is very mild, a degree or so of frost only being registered in the winter months, and, on the whole, I should say that the climate is very similar to that of the south-west coast of Ireland. The islands are of volcanic origin; Chatham Island itself is made up of two large masses of land joined together by a narrow isthmus composed of limestone. Blown sand forms an important physical feature of the island and, to some extent, has caused in it also the formation of a huge inland lagoon some 40,000 acres in extent, by cutting off a large area of shallow sea. Close to this lagoon there is a large freshwater lake, Lake Huro, which drains the country bordering the great lagoon to the south, and has a swampy outlet to the south into the Weitangei river, and there are several other freshwater lakes. The south end of the island contains the larger mass of land and rises to nearly a thousand feet above sea-level in a succession of peaty, boggy undulations; the higher one ascends the worse the bogs become. The slopes adjacent to the sea-coast, therefore, are the only parts under pasturage, and what there is of it is excellent, and probably as fertile as that in any part of New Zealand itself.

"But to return to the day of my arrival in the island; being more or less wet through after my ride to Mr. Cox's house, and as it was still pouring with rain, I took the opportunity to visit the swamp on the shore of Lake Huro, which is adjacent to the house. In the wettest part I found only various forms of swamp plants such as Leptocarpus simplex and Carex appressa var. sectoides, with here and there Phormium tenax; but as soon as the swamp became the least bit drier one came upon the lowland forest, first Coprosma propinqua, then Suttonia Coxi, with more flax, and Arundo conspicua, while further in one found plenty of Olearia Traversi, Pseudopanax chatamicum, Copresma chathamica and Suttonia chathamica; Dracophyllum arboreum also occurs, and a very fine Astelia, which Mr. Cheeseman refers to as A. nervosa; I picked some leaves of this as much as 8ft. long, and gathered living specimens of the various species of Carex for Dr. Cockayne. On the edge of this swamp I saw my first 'Routine' (Senecio Hunti): this is a fine plant, resembling in its mature state Senecio Stewartiæ of the Snares Islands, but differing considerably in its juvenile form. I returned to the hotel for the night, having completed my ducking in the swamp, and arranged to examine the forest at the back of Whangamarino with Mr. Cox on the following day. On joining Mr. Cox at his house I found that there had been 75 parts of rain, and it was still damping. About eleven o'clock it eased off, and we started on horseback to the back of the run, to collect some small plants of Senecio Hunti; this we did without much difficulty, and examined the forest which is most interesting and differs entirely from the forest of the mainland. On the island the trees grow to no great height (20ft. to 25ft.), and the tops are kept well in order by the wind and form a compact mass. I saw some fine trees of Veronica gigantea, 20ft. high, in full flower, and Senecio Hunti just coming into flower. The commonest trees about this part were Corynocarpus lævigata (the Karaka), Coprosma chathamica, Hymenanthera chathamica, Olearia Traversi, Corokia macrocarpa, Pseudopanax chathamicum, and Suttonia chathamica. The native pepper, Piper excelsum, was fairly common, and the whole was entwined with endless Supple Jacks (Rhipogonum scandens), while I saw at least five varieties of tree ferns—Cyathea dealbata, C. medullaris, C. Cunninghami, Dicksonia antarctica, and D. squarrosa—and a few Raphiostyles sapida dotted about. The floor of the forest is covered with moss and lichens, especially on the dead stumps, while filmy and other ferns abound. We also visited a sphagnum bog close by, and obtained a bag of moss for packing up the plants. The sphagnum patches were colonised by several plants, chiefly Gleichenia dicarpa and some Pteris esculenta, and I was much struck with the lovely little Pratia arenaria, which seemed to grow anywhere and everywhere, and closely resembles the well-known Pratia angulata, so lovely on moist rockeries at home. Some months previously Mr. Cox had collected several plants of Olearia semidentata and Styphelia robusta, which had become established in his garden and were growing well, and it is due to his kindness in collecting them for me that I was able to leave with a large number of both of these plants. I was interested to see some fine plants of Olearia chathamica growing there, and also a fine plant of Olearia Lyalli, introduced from Ewing Island, in the Auckland Island group, as well as other of the native trees. Dr. Cockayne was anxious to obtain seedling forms of Veronica gigantea, and these I found about the shrubberies; in form they are very different to the mature trees, the leaves being larger and covered with downy hairs, while the stems are of a reddish-purple colour.

(To be continued).

THE GOLDEN-LEAVED CHESTNUT.

People who are fond of rare trees and shrubs ought not to omit this tree from their collection, for it is a very interesting and beautiful subject. Though allied to the sweet chestnut, it really belongs to another genus, and is known by the name of Castanopsis chrysophylla. It is a native of California, and has been known to British horticulturists for about 80 years. The leaves are evergreen, and resemble those of the evergreen or Holm Oak in shape and size. They, however, differ from the leaves of that tree by being golden on the under surface, hence the popular name of golden-leaved chestnut. The leaf colouring is very evident on a breezy day, for, as the branches are blown about the colouring of the under surface is exposed to view. The fruits are very similar to those of the sweet chestnut, the husks being spiny and the nuts brown, and very similar to the chestnut in flavour. They are, however, very much smaller. Under normal conditions it attains the proportions of a tree, though it is often found as a good sized bush. One of the finest trees in the country was to be found a few years ago on Earl Ducie's estate, Tortworth Court, Gloucestershire, and this specimen frequently perfected fruits. Quite young specimens sometimes bear fruit, and perfect ones have been gathered from five-year-old trees. The tree grows well in rather light soil containing a little peat; it objects to root disturbance after it has once become established. D.

Hemerocallis Apricot. — The varieties of the Day Lily are now numerous, but none is more free-flowering or beautiful than H. Apricot. At the time of writing I have a plant in the mixed border with three dozen fully-developed blossoms. The flowers of this variety are shapely, and of a deep orange-yellow. The growth, too, is not so robust as in some sorts, being more compact, and therefore it is more useful than the extra strong-growing sorts, like H. lutea, for example.—E. M.

Liatris spicata.—This is a plant of great beauty and usefulness, and is vested with a peculiar interest in that, contrary to the general rule of spiked flowers, the blooms commence to open at the top of the stem, and development gradually descends to the base. In most things the reverse method obtains of commencing at the base. Liatris spicata grows about eighteen inches high, and its flowers are of a lively rosy-purple hue that is distinct and pleasing. It is a plant that takes up but little room, and may be used to good purpose in the front of a herbaceous border to break the level of the dwarfer subjects. A cool, moist soil suits the plant well, so long as there is fairly good drainage. The spikes remain in bloom for a long time, and it is a good subject for exhibition in collections of flowers of hardy herbaceous plants.—A. J. M.

NOTES FROM KEW.

Macleania punctata.

On May 3 of the present year an Award of Merit was given by the Royal Horticultural Society to an allied species, namely, Macleania insignis. The specimen shown was as a pot plant, a condition under which the macleanias are by no means seen at their best, as they are plants of a rambling nature, and are more fitted for training up the end of a greenhouse, or in some similar position. In the Temperate House at Kew Macleania punctata is treated in this way, and is now flowering freely. It is a member of the Vaccineum family, with neat evergreen leaves, and drooping tubular shaped flowers, in colour scarlet tipped with a lighter tint. They are borne in considerable numbers towards the upper parts of the shoots. This macleania, in common with many of its allies, is a native of the Andes, and was sent home from Ecuador by William Lobb to Messrs. Veitch's nursery at Exeter, where it first flowered in 1848. As a screen plant it will mount up to a height of ten to a dozen feet. As with most vaccineaceous plants a compost containing a liberal supply of fibrous peat and sand, with good drainage and a free supply of water, suits it best.

GENISTA CINEREA.

A strong-growing and free-blooming species from South-Western Europe; the flowers rich golden yellow.

Rhabdothamnus Solandri.

A small plant of this in the Temperate House is just now flowering freely. It can scarcely be regarded as showy, but it is certainly pretty, and most interesting. This rhabdothamnus is one of the very few gesnerads that may be regarded as of a strictly shrubby nature. Mitraria coccinea is one of these, and, singularly enough, it inhabits some small islands off the coast of Chili, while the rhabdothamnus comes from New Zealand, thus forming another link between the vegetation of the western side of South America and the islands of New Zealand. Rhabdothamnus Solandri is a distinct little shrub, whose slender twigs are clothed with greyish-coloured bark, while the leaves are small, nearly round, distinctly toothed, and veined on the undersides. The flowers, in form something like those of a tydæa, are of a reddish-orange tint, with brownish stripes inside. They are about three-quarters of an inch in length, and as much across the expanded mouth. The rhabdothamnus was distributed about half-a-dozen years ago, but it is still decidedly rare.

Cantua bicolor.

The cantuas are very beautiful flowering subjects belonging to the order Polemoniaceæ, but are rare in gardens. They are natives of high elevations in the Peruvian Andes, and are, as a rule, difficult plants to cultivate. The species under notice, which is in flower in the Temperate House, is a loose, slender-growing shrub, clothed with small, slightly hairy leaves. The flowers, which are borne at the ends of the shoots, are drooping, somewhat bell-shaped, nearly a couple of inches long, and a good inch across the corolla lobes. In colour the tube is yellow, and the expanded mouth scarlet. This cantua was sent home by William Lobb when travelling for the Messrs. Veitch in the late forties, while it was also introduced by the Messrs. Low, of Clapton, about the same time. A second species, also introduced by William Lobb, is Cantua dependens, with clusters of long drooping flowers, in colour orange and reddish-pink.

Hæmanthus Katherinæ.

Several of the finest species of hæmanthus are by no means amenable to cultivation, but this forms a decided exception, and as a garden plant it must be regarded as one of the best of the entire genus. Being a native of Natal, it does not require the same amount of heat as some of the others: indeed, there is just now a fine group in the T range associated with such subjects as pelargoniums and Cape heaths. The flowers of H. Katherinæ are bright red, and borne in dense globular heads.

Kalanchoe Hybrids.

Since the introduction of Kalanchoe flammea about a dozen years ago we have had several hybrid forms brought prominently forward. One of them, K. Felthamensis, has heads of flowers yellower than those of K. flammea; another, K. Princess Ena, has rich crimson flowers, and if the heads were as large as those of K. flammea it would be very fine. The third hybrid is K. kewensis, tall, and spare in growth, with narrow fleshy leaves, and umbels of deep pink flowers. All of the above are in flower in the greenhouse at Kew.

Cytisus scoparius sulphureus.

It is difficult to imagine anything more appropriate than the popular name of the moonlight broom, as applied to this variety of our own native species, the quiet tint of the flowers when viewed in a mass being very suggestive of the subdued light from the moon's rays. It is of more lowly stature than most of the varieties of Cytisus scoparius, but is exceedingly floriferous.

Rhododendron azaleoides.

This is the name given at Kew to a delightful old shrub whose merits are only too often overlooked. By the middle of June nearly all the deciduous rhododendrons, or azaleas, as they are generally termed, are past their best, and at that time this is in full flower. It is by some regarded as a hybrid between R. ponticum and the North American R. (Azalea) viscosa known popularly as the swamp honeysuckle. The "Kew Hand List," however, gives the parentage of R. azaleoides as R. viscosum x R. maximum. At the back of the Palm House it is just now in fine condition. In style of growth R. azaleoides is more compact than the Ghent azaleas, but the flowers are of much the same size. They range in colour from very pale lilac to a lilac-purple; in some instances the edges of the petals are of a deeper tint than the rest of the flower. The foliage is sub-evergreen in character. This rhododendron is exceedingly prolific in names, being known, beside the above, as R. hybridum, R. ponticum deciduum, R. odoratum, and R. fragrans. The last two names are derived from the pleasing fragrance of the blossoms, a most desirable feature.

Genista cinerea.

One of the brightest features among hardy shrubs for some time past has been a group consisting of several plants of this genista. The tallest of these reach a height of ten feet or more, and the outside branches dispose themselves in a pleasing and informal manner. Every shoot is absolutely laden with flowers of the richest yellow, the general effect being that of a dense golden mass. This genista, a native of South Western Europe, is, despite its desirable features, not readily obtained from nurseries. A nearly allied species—Genista virgata—is also very fine at Kew, where it forms an annual feature. It is in the "Kew Hand List" said to be a native of Madeira, but is so hardy that one is inclined to ask whether there is not some mistake in the matter. K.

THE ANTIQUE IN ROSES.

The rose came out of the East so long ago that we cannot trace its origin as a cultivated blossom, but at the very beginning of the Christian era there existed the famous rose gardens at Paestum, in Lucania. In the Song of Solomon mention is made of a rose plantation at Jericho; Heredotus wrote in praise of the double rose; Pliny describes several sorts of roses grown by the Romans; and Midas, the Phrygian king, walked in pleasure-grounds the beauty of which was due to this queen among blossoms.

Then who does not know that the Isle of Rhodes was once named Isle of Roses on account of their extensive culture there, or that the famous Persian Gulistan was a rose garden of such vast dimensions that five days were occupied in crossing it, riding upon camels. The Hindoos loved the rose so well that they imagined one of the wives of their god Vishnu to have been discovered in a bloom of perfect beauty; and the Greeks named it the flower of Venus.

In our own land the history of rose culture is too profound a subject even to be sketched, but it is interesting to remember that in 1576 roses were accepted by the bushel as fit grants from vassals to their lordly patrons. Perhaps the poetic lines that are best known of the many volumes that have been written in praise of this flower are those of Scott:

> "The rose is fairest when 'tis budding new,
> And hope is brightest when it dawns from fears;
> The rose is sweetest washed with morning dew,
> And love is loveliest when embalmed with tears."

It is a great tribute to the horticultural taste and skill of our ancestors that when we wish to create a specially charming rosery to-day we model it, more or less, upon the old-world gardens. What can be fairer than four great square beds, surrounded by wide gravel walks, and then by borders and green turf, with arches spanning the paths, arbours in some corners, and a sundial in the centre? Yet this is just the same plan that our great-grandfathers loved to carry out.

Some of the antique roses are lost to us now: A reason this why we should one and all resolve to do our share in rescuing others from oblivion; in other cases we have given up pleasing methods of growing the same species and varieties. The striped, wide-opening, flat, red and white York and Lancaster rose, for example, is still with us, appreciated by the artistic few, but it is rare indeed to find it in weeping standard form. An old writer declares of this and the other damask roses, "They are fragrant flowers, but the bushes on their own roots are of irregular, scrubby, and inelegant growth.' Varieties in commerce then were La Constance, or the pæony-flowered rose, a pink with deeper centre; Madame Hardy, white; Semiramis, fawn with rose shadings; La Ville de Bruxelles, a much-valued double pink; Madame Zoutman, delicate cream colour; La Chérie, blush; and La Féroce, an extra thorned pink. Who can show these now?

There was a pretender even then in the field, for we read that "Another wide-spread variety" (of Rose Gallica, the French rose) "is the coarse, semi-double, striped rose which ought to be called Rosamond, or Rosa mundi, the World's Rose, though it is often wrongly styled the York and Lancaster." The same writer goes on to recommend French roses for town culture, adding: "From them have been raised several beautiful striped and spotted varieties, as the Village Maid, Carnation, Abesse, Duc d'Orleans, Ponctuée, Harlequin, and others. The spots are less to be depended upon than the stripes. Many are admirable as exhibition flowers; take as instances, Enchantress, light pink; D'Aguesseau, bright crimson, very large and full; Boule de Nanteuil, dark crimson," etc., etc.

Then we are taught in the same volume that "All the Scotch roses resemble each other very much in their habit of growth; they are less easy than other members of the same genus to distinguish, when leafless in winter, by the aspect of the wood. A collection of the different varieties makes, therefore, a nice even hedge of roses, which only requires looking over once or twice a year to keep it compact and in order. Budded as standards, they make pleasing heads when full in bloom, but require considerable patience to prune, which must be done by thinning out rather than by cutting back."

Turning to the culture of hybrid perpetuals, it is on record that one highly-prized kind, Rivers' George the Fourth, a dark velvety flower, sprang from seed "by accident"; while one variety, named Brennus or Brutus, a large crimson, was not only grown as a standard and pillar, but also as "a tree, budded on a tall stout stock." Another H.P. of the period—before the year 1834—was Chénèdolé, of bright red; Blairii No. 2, Hebe's Cup, may still, I believe, be obtained. It is amusing to note that Lamarque then was "one of the darkest crimson-purple roses, requiring to be shaded in hot sunshine." Félicité Perpetué, described as "an elegant climber," was employed, we are assured, not only for weeping standards, but "to climb up trees, like honeysuckle"; a hint of which modern rosarians may like to make use.

The Chinese and Japanese roses, Rosa multiflora, were greatly admired, but were chiefly cultivated under glass, forming standards in giant tubs, with the exception of Fortune's Yellow, or Wang-Jan-Ve, which could be grown as standards of immense size in the open, the "heads being more than four feet through," or "scrambling over old walls." As a late-blooming rose the old-world floriculturists recommended "the Portland, or Pæstan, or Four Seasons Rose, a bright, semi-double, fragrant flower, which deserves cultivation, as it will put forth welcome blooms in November."

Fashion has certainly ousted numbers of the antique favourites. In our old-fashioned rose garden of to-day, however, there are still many that we can have in memory of their past glories, and in recognition of the fine qualities that have enabled them to battle through the years. Aimée Vibert, Souvenir de Malmaison, Jules Margottin, Géant des Batailles, Lady Alice Peel, Fellenberg, Jaune Deprez, Mrs. Bosanquet, Solfaterre, Devoniensis, Souvenir d'un Ami, The Garland, Moss Unique, and the White Bath Moss, should be in every rosery. M. H.

GROWING PERPETUAL CARNATIONS THE SECOND YEAR.

The season is late, and many will have bedded out or dispensed with their perpetual carnations which have done service during the winter, while others will be undecided as to what to do with the old plants. Speaking purely from a cut flower point of view, the perpetual carnation will produce first-grade bloom for two consecutive seasons, and nearly all our best market growers carry their stock over the second season. Of course, the two-year-old stock has never quite the smart appearance of the younger plants, but for quantity of flower they are quite their equal, and in the case of odd varieties their superiors in quality.

I know that in many private gardens this two-year-old stock is objected to, and if this is the case, and cuttings are plentiful, it would be folly to use it, but such is not always the case. If the blooms have been cut with long stalks during the winter so as to keep the plants reasonably short, little pruning will be required. There is no gain in pruning hard back, because this will make them late in flowering. Also the breaks made from the very hard wood will not produce such a high quality of flowers, while invariably the plants succumb to this harsh treatment.

Potting is the most important factor in growing plants on for the second year. This should be done as early as possible, and a very large pot should be avoided. Such an advance as a five-inch pot-grown plant into an eight-inch pot is a good shift, but if a plant from a larger size pot is potted on, as much as possible of the old soil should be removed, and a ten-inch pot is the limit to pot into. The plants will not be benefited by too much shading, but a light shade, with plenty of spraying on bright days, is best. This treatment for a week or ten days will see the plants get away into a free-growing state, when they may be stood out in the open so as to repair their health and vigour for the ensuing winter.

I do not say that plants during the second season are quite as good for propagating purposes as younger plants, but if correctly grown and well cared for they must certainly produce a tremendous crop of flowers. Montagu C. Allwood.

WOOD GARDEN HUTS

for use as Tool-sheds, Workshops, Potting Sheds, Play-rooms, Cycle Houses, Motor-car Houses, etc., etc. Strongly built of selected materials by skilled workmen. Made in sections for easy erection and removal by local workmen. Painted and finished throughout in a superior manner.

SWEET PEAS AND MENDELISM.

All who are familiar with current literature relating to the sweet pea must frequently have seen references to Mendel's principles of heredity, but, although Mendelism is of enormous importance, especially to those who cross sweet peas, the vast majority of gardeners have very little knowledge of the subject. There is no need, therefore, of an apology for writing an article explaining some of the simpler facts relating to it. Let it first be understood, however, that this is not to be looked upon as a scientific treatise.

We could not proceed far without the use of a few technical words, but such words will be used as little as possible, and when used will be thoroughly explained. If any passage is not understood on a first reading, it is suggested that a second reading will throw light on the obscurities.

To study Mendelism we must first consider how each plant really commences its existence. We all know that if a flower is to develop into a seed pod, pollen must first come into contact with its stigma. The processes that follow need not be described here, but what we must remember is that each seed, i.e., each new plant, is formed as the result of the union of two elements, the one male (the pollen) and the other female (which the male element reaches by means of the stigma).

The female element necessary for the production of a seed we shall hereinafter refer to as the female gamete, and the equally essential male element we shall call the male gamete. Each gamete, in spite of its very small size, bears with marvellous exactitude all the characteristics of the plant that produces it, and the plant that results from a gametic union retains throughout its entire existence these two separate sets of characteristics, and whenever we consider a sweet pea plant we must never lose sight of the fact of its dual nature.

Now we know that in the ordinary course of events the sweet pea is self-fertilised, i.e., the unions that result in the formation of seeds are between gametes, both produced by the same plant (their common parent), and therefore resemble one another. A plant formed by the union of two similar gametes is called by the scientist a homozygote, or, in more simple language, a pure-bred plant. It will, of course, resemble its parent.

In some seed producing unions, as in the case of a cross between two distinct varieties, the gametes represent plants which differ from one another. The gametes themselves, therefore, are unlike, and the plant that results from their union is said to be heterozygous, or, more simply, impure in breed. The study of the outward form and of the progeny of such a plant are both interesting and important.

The parents of the impure plant may have differed in one only, or in more than one, respect, but to simplify our study, we will consider the case of a plant impure as to one characteristic only, that of height. If we cross an ordinary tall variety of sweet pea with a dwarf or Cupid variety, we find that in the first generation after the cross (referred to as the F1 generation) each plant produced is tall like its tall parent. Let us thoroughly understand what this means. We have a plant combining in itself two dissimilar natures, the one tall and the other dwarf, and yet the tallness appears to have entirely suppressed the dwarfness. The scientist refers to tallness as being dominant, and to dwarfness as being recessive.

In the same way we find that, in the flower of the sweet pea, white is dominant to the recessive cream. Any other colour is dominant to white or cream. Purple is dominant to red, and the plain, erect standard is dominant to the Spencer or waved standard. Two qualities showing this relationship are said to be allelomorphic to one another.

In passing it may be added that in some cases of heterozygosis neither allelomorph is entirely dominant, but the impure plant is intermediate between its two parents. In such cases, however, the impure plants breed exactly the same as in the cases of total dominance.

Let us now proceed to consider the nature of the gametes produced by impure plants. Again, taking the case of a tall plant, resulting from a cross between a tall and a Cupid parent, we find that, on an average, half the gametes it produces bear the factor for tallness and half bear the factor for dwarfness, but there are none of an intermediate nature. Both male and female gametes are produced tall and dwarf in equal numbers, and, as in the sweet pea, the flowers are self-fertilised, each tall male gamete has one chance in two of uniting with a tall female gamete and one chance in two of uniting with a dwarf female gamete. In the same way, half of the dwarf male gametes unite with dwarf female gametes and half with tall female gametes. We find, then, that one-quarter of the unions that produce seeds (and, in due course, plants) are between gametes which both bear the factor for tallness, one-quarter are between gametes which both bear the factor for dwarfness, and the remaining half are between unlike gametes. The plants in which the united gametes both bear the factor for tallness will, of course, be tall, and those in which both the gametes bear the factor for dwarfness will be dwarf. The impure plants will all be tall, for when dwarfness and tallness are together in the same plant, tallness, as we have seen, is dominant. The F2 generation (as we call the generation resulting from the self-fertilisation of the F1 plants) will therefore consist of one-quarter dwarfs and three-quarters tall plants. The dwarf plants produced in the F2 generation will in succeeding years breed true to dwarfness, because both parts of their dual natures being dwarf, the gametes they produce will all bear the factor for dwarfness. The tall plants, which form three-quarters of the F2 generation, are of two kinds, those pure for tallness, and those impure, the latter being twice as numerous as the former, but these, to the eye, are indistinguishable from one another, and to know to which class any one plant belongs it is necessary to save seeds from it. If the plant is impure it will, when the seeds are sown, produce a proportion (one-quarter) of dwarf plants, but if it is pure, it will produce tall progeny only, and in succeeding generations will continue to do so.

Let it here be noted that the impure plants produced in the F2 and later generations are precisely similar to the original F1 plants, and that it makes no difference whether, in the original cross, the tall plant is used as the male (or pollen) parent, or whether it is used as the female parent. The results are the same whichever way the cross is made.

That which is true of tallness and dwarfness is true of other allelomorphic qualities also, e.g., a plant impure as regards creamness and whiteness of flower, will produce a progeny one-quarter of which are pure creams, one-quarter pure whites, and one-half impure whites. The words "pure" and "impure" in this article are used to describe the gametic constitution of the plants, and do not refer to the colour of the flowers. As white is completely dominant over cream, the impure white plants are indistinguishable to the eye from the pure plants.

G. F. DRAYSON.

(To be Continued.)

LETTUCES.

An unremitting supply of lettuces is, I think, a necessity in every garden, whatever size the establishment may be, and more especially through the summer months, when salads are so much in request, and of which lettuces form the staple part. Lettuces owe their popularity, no doubt, to their suitability to practically all soils, providing the ground is well worked and enriched with decayed farmyard manure. These remarks apply to both the cos and cabbage section, and supplies of these may be maintained if frequent sowings are made, and the seedlings transplanted in various positions in the garden. The size of each batch grown must be governed by the extent and requirement of the place, remembering that during hot, dry weather lettuces are soon past their best.

Sow the seeds in drills and protect from birds if the latter are troublesome; and when the plants are large enough to handle, prick them out in various positions, where it is possible to find room for a single row; for instance, under a wall, or between other growing crops. Well water the young plants in, and thin those that remain in the seed-bed to one foot apart for the cos, and nine inches for the cabbage varieties. It is surprising, especially in a good growing season, how quickly lettuces mature. Frequent Dutch hoeings between the plants are beneficial, and should dry weather prevail copious supplies of water must be given.

Although lettuces do not figure much on the show boards, yet at most exhibitions prizes are offered for stated numbers of specimens in variety. To those who contemplate competing, I would suggest that a little extra attention be bestowed upon the preparation of the ground, and also in the blanching of the cos varieties. Whether self-folding or not, for exhibition or kitchen use I recommend tying up the plant with broad strands of raffia. This does not entail a great amount of labour, leaves the bed neat, and ensures much superior hearts in the lettuces themselves, as well as that crispness so much esteemed. When required lettuces should always be pulled clean out of the ground, and the roots trimmed and the base of the plant washed. For show purposes, if taken any distance, the roots are best left on, washed, and tied up with damp moss. In this manner they will be found to travel well and retain their fresh appearance.

Varieties in both sections are numerous, and certain varieties find favour in some localities, and are much to be preferred to others. Of the cos varieties Superb White and Mammoth White are excellent for all purposes, and Selected Black Seeded Bath is fine. Of the cabbage section All the Year Round, Marvel (a distinct and useful lettuce of striking bronzy colour), Drumhead, Perfect Gem, Grosse Pareusse, Golden Ball, or Golden Queen are good.

E. BECKETT.

Aldenham House Gardens.

There is no better guide to the kitchen garden than VEGETABLES AND THEIR CULTIVATION, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

STEPPING STONES.

Sometimes it is the seemingly unobtrusive topic that is fraught with the greatest interest. One tires of reiterated subjects, even if they are of certain importance, and turns to wayside thoughts with a feeling of relief and restfulness. It is so in all walks of life, and none the less true in gardening matters, and so with no apology for introducing the subject I will endeavour to turn the thoughts of garden lovers to stepping stones.

The importance of stepping stones in the garden grows more manifest every day. With the extended sway of the rock garden, the water garden, and the wild garden, comes the necessity in many places for causeways of natural stone, and if well arranged and carried out in an artistic manner the effect will prove pleasing to the extreme.

WINTER GARDEN AT BIRKDALE, SOUTHPORT.
Erected for P. Crook, Esq., by Messrs. W. Richardson and Co.

The ultimate beauty of stepping stone pathways lies, not only in their proper arrangement, but in the setting and colour effects of the garden in which they have a place. For instance, in the rock garden, if one can have a hard stony track winding through a rocky gorge, or a stepped way up through the rising mounds and grey boulders, one obtains a far better effect than if one utilised the ordinary gravel path as a means of traversing the abode of the rock plants.

One becomes so tired of gravel paths, neat and clean though they appear, and greets with pleasure the track of stone in which many hardy plants find a suitable home, and fill many of the interstices between stone and stone. Call the effect what you will, and the scene still remains "a pleasing informality in an informal garden."

Or take the water garden, as a case in point, and consider the utility of stepping stones in conjunction with aquatics and waterside plants. What is more fitting to provide a firm way by the streamside, where one can follow the winding stretch of shallow water and view the subjects as they come into blossom. We have an excellent example of this in the stone pathway by the lake side at Rufford Abbey, which is so admirably illustrated in the Gardeners' Magazine of June 18. Again, as a series of broad thick stones to carry one through the shallow water of the pools, to cross the streams, or to wander through the iris swamps and waving reeds, will prove of decided usefulness in providing an efficient mode of getting about in the water garden, in addition to forming a pleasing permanent feature in itself.

Judge, too, of the utility of the "stepping stones" in those varied phases of beauty which we term "the wild garden." The material value of rugged stone steps to ascend a bank girt with wild plants and hardy ferns, to give an ever-dry footing among the jungled maze of bamboos and grasses, to carry one through the dell of rhododendrons, and the delights of azaleas, maples, and a hundred other flowering shrubs, and to give the gentler sex the means of wandering dry-shod in spring among the waving hosts of daffodils, scillas, tulips, anemones, etc., and in autumn among the glowing stretches of heather, linarias, ragworts, and Michaelmas daisies, surely warrants the giving of the stepping stone a high place in the making of gardens. Nowhere has the "stepping stone" been so much utilised or lifted to so high a plane in the "garden adorned" as in Japan. Here they are regarded at their true value, despite the fact that a good deal of sentimentality is associated with them. The "flying stones" or "scattered islands" give an Anglicised rendering of the Japanese ideal in the setting of the "stepping stones." Whatever formality may exist in the stones themselves, it is discounted by the pleasing arrangement in which they are placed. Diversity in size, winding turns and bends, and studied grace in setting, creates a pleasing effect, especially if the stone way takes one through a crystal sheet of water, or in close proximity to it. A formal straight course of stepping stones is almost an impossibility, inasmuch that accuracy of step is better maintained by a diverse, winding series of stones. What really matters is that the stones should be hard and capable of resisting weather vagaries and the "wearing influence" of passing feet. They must be sufficiently wide for an ordinary person to walk over with ease, and they must be firmly set, whether it be upon the solid ground or in the stream or pool.

Finally, the English gardener or landscape artist would do well to confine his energies to one class of stone for a stepping stone causeway. Efforts to copy the Japanese style in utilising varied kinds of stone would probably result in failure, as no Englishman, or, indeed, anyone outside of the Far Eastern land of flowers, could venture with any certainty of success upon a combination of varied types of stone. The result would probably be somewhat bizarre, if not grotesque, instead of a harmony which would give entire satisfaction. Above all, the stepping stone has a purpose. It must supply a necessary demand. It exists not to provide aimless tracks in the garden, but to give tone, strength, and individuality to the garden, in addition to providing a permanent way from one portion of the garden to another.

Do not use stepping stones to gratify a whim, or because someone else has them, but utilise them, if you will, as a ready means of access, "a causeway of necessity." And in using stepping stones avoid all efforts at ornate design. Let the keynote of the whole scheme be simplicity. Whether your ground be flat or broken, ridgy or in sloping banks, the whole arrangement should be as simple as possible.

This way lies art. With natural groupings of plants and shrubs, softened outlines, and softening greenery, a simple stream or sweep of water, a wise choice of subjects and an effective placing of stones, will do more to give a garden a distinctive appearance than the ornate designs, bright colour schemes, and unsuitable masonry which some would gladly foist upon us. That the stepping stone has a future in English gardens we are well assured. It remains for us to make the best "of" it, and "with" it.

P. S. HAYWARD.

ROSE BUDDING.

July and August are perhaps the best months for budding roses, the first being a little the better if stocks and rose buds are in proper condition. But where there is a large quantity or the stock of any desired variety is weak or limited, then work depends entirely upon being able to secure the buds. These must be used when in a fit condition, while the stock will generally be workable from the end of June up to early September. Success is not so certain after this date, as the sap ceases to flow regularly and freely, and, consequently, the rose bud does not set so well to the stock. It is better to have the stock growing freely without being rampant and coarse; in the latter case there appears to be so much sap that the bud is flooded, and for that reason we do not manure or force our stocks so much as is the case in some gardens.

A rampant and extra strong-growing stock has a tendency to grow over the bud and smother it, as the rose bud itself cannot grow in due proportion. Especially is this the case when a bud is taken from slender growth and inserted in a rapidly swelling stock. Another decided advantage in having a less rampant, and what I may perhaps call an overfed stock, lies in the fact of both bud and stock connecting earlier and firmer, while they become better matured, and are able to pass through the winter with greater safety. A seedling briar that may be no larger than a knitting needle when planted will often swell to a circumference of two to two and a-half inches if upon richly fed soil, and to bud early upon such stocks is not nearly so successful an undertaking as would be the case if not growing so strongly. I think we may lay far more failures to this cause than many imagine. After the bud is set, and has come through the winter, feeding is quite correct, but not before.

Supposing the plants to be growing fairly well, they may be budded as soon as the bark will lift easily, and, as already noted, we must use the buds when ready unless there is a large stock to select from at once, but we generally wish to propagate some variety that is scarce, or which we, at all events, are short of. Let the rose shoot you are working from be as nearly as possible in the same condition as the portion of the stock it is to be inserted in. This ensures a better union, and the bud and stock are in better proportion to one another.

The process of taking the bud and its insertion has been explained in detail so often in these pages that I only propose a few hints for better treatment. On no account should there be any forcing or bruising when lifting the bark. The smoother and cleaner this can be raised, and the less the glutinous sap is disturbed, the greater are the prospects of success. It is the same with the rose bud, which should come away from the shoot freely, and allow of the small portion of wood being taken away so as to leave the seat or base of the bud prominent enough to rest upon the exposed wood of the stock. Many fail to tie sufficiently firmly. If the operation is successful the tie can be released in a month's time, and so constriction is avoided; but tie firmly at first, and more particularly close to the eye or bud, so that the latter may be kept well down upon the stock.

Always endeavour to get the bud as closely upon the roots of dwarfs as possible and as near to the main stem of standards. The great advantages of this is evident when we come to consider the suckers which are avoided. Should the bark not lift easily, watering will generally cause the sap to flow freely in the course of a week, and to meet with success both stock and bud should possess active sap at the time of operation. When selecting the buds it is undoubtedly best to cut from the healthiest specimens, also from plants that have produced the best flowers, if you have the advantage of choice. I believe more depends upon such selection than some growers think, if one may judge from the indiscriminate use of buds I have often witnessed. Like has a decided tendency to produce like in every form of growth, and I would certainly secure the buds from the best source possible.

P. A.

INTERIOR OF WINTER GARDEN AT WILLASTON, HARROWGATE.
Erected for W. H. Benn, Esq., by Messrs. W. Richardson and Co.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "BULBS AND THEIR CULTIVATION," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CONSERVATORY DESIGN.

(Concluded from page 492.)

Messrs. Messenger and Co., Lim., Loughborough, and 122, Victoria Street, London, S.W., have executed some very large orders, and a few of these include the whole of the glass department at the Royal Horticultural Society's Gardens, Wisley; the big ranges of glass at the Hillingdon Nurseries of Messrs. William Whiteley, Lim., ranges at Sherborne Castle, Reigate Priory, Lister Park, Bradford, as well as large conservatories for C. R. Palmer-Greenwood, Esq., Alfreton Park, Derbyshire; Sir Angus Holder, at Nun Appleton, Bolton Percy, Yorks; Admiral Hanson, Poynton Towers, Poynton, Cheshire; and Duke of Norfolk, at Arundel Castle. We refer to these to show that Messrs. Messenger and Co. are quite capable of the great as well as the small orders, although we have selected two smaller designs to illustrate their work, and we have done this because there are so many who can nowadays be the happy possessors of small, elegant, and altogether delightful conservatories, whereas comparatively few can afford the large and princely structures we all so much admire and covet. The conservatory erected at Mountfields, Loughborough, for the late J. Griggs, Esq., J.P., D.L., is entered from the garden by an elegant porch, and from the house by means of the billiard-room. On the far side it is attached to the vinery. It is pleasing, simple, roomy, comfortable, and effective, and measures 26ft. by 51ft. 6in. The interior view shows another conservatory erected at Field House, Loughborough, for W. C. Burder, Esq., J.P., and it is a beautiful little place, 14ft. by 19ft., and just the sort of conservatory that ought to be multiplied by the hundred throughout the country.

INTERIOR OF SMALL CONSERVATORY, FIELD HOUSE, LOUGHBOROUGH.
Erected for W. C. Burder, Esq., J.P., by Messrs. Messenger and Co., Lim.

Where the house or mansion is at a considerable elevation, the conservatory attached to it must be duly proportioned to it or the effect of both will be spoiled. A very fine design, combining architectural beauty as well as due consideration for the gardener, who has to keep it filled, is the conservatory built by Messrs. W. Richardson and Co., Darlington, at Birkdale, Southport, for P. Crook, Esq. A more elegant and yet simple design, directly connected with the mansion, it would be difficult to conceive. Another example of the work of the Darlington firm is also shown. This is the interior of an elaborate, highly decorative winter garden erected at Willaston, Harrowgate, for W. H. Benn, Esq., and shows a delightful retiring-room, where one may smoke, or read, or write, amid the exquisite beauty of flowers and foliage that Nature and art have combined to produce. Some other fine specimens of the work done by Messrs. W. Richardson and Co., are to be found at Smedley's Hydro, Matlock; Lord Gerard's home at Moulton Paddocks; the far-away public gardens of Lahore, in the Punjaub; Mr. W. B. Avery's estate at Oakley Court, Windsor; Earl Warwick's find old seat, Warwick Castle; Wynyard Park, co. Durham, the seat of the Marquess of Londonderry; Hanley Park, Stafford, etc., etc.

Rose Dr. J. Campbell Hall. — Although not a new variety this H.T. rose, introduced by Messrs. A. Dickson and Sons in 1904, deserves to be better known than it is among rose growers. Flowering early, it gives handsome blossoms, large and full, and of a coral-rose colour, heavily suffused with a deeper shade, and with a satiny appearance.—E. M.

CLEARING KITCHEN GARDEN CROPS.

To ensure a good supply of green vegetables during the latter part of the year and onwards into early spring, one must be prepared to take advantage of every opportunity for getting in the crops as soon as the ground has been cleared of others. The risk run by many at this season, who do not anticipate the dangers of late summer sowings, is that their seedlings will be at the mercy of early frosts and cold uncongenial autumn weather; and if not vigorous and well developed at that season, they will certainly succumb. Such crops as winter greens, including borecole, broccoli, etc., must be planted as early as possible, as it is impossible for them to survive the winter if planted at a late date.

Peas and beans should be cleared as soon as they have ceased to be productive. Often the grower is tempted to retain these crops merely for the sake of a dish or two of late peas, with the result that the summer plantings or sowings are delayed. Surely it is more profitable to utilise the space occupied by these flagging crops with a certain crop of winter greens, turnips, or cabbages. For a similar reason, stumps of early cabbages must be cleared off the ground as soon as possible, and, if desirable, a small plantation may be formed elsewhere; while the space occupied by the cabbages may be planted with some useful crop.

In the kitchen garden there are no more important branches of work than manuring and digging. A liberal supply of manure should be incorporated with the ground at least once a year, the most useful material being partially decayed farmyard or stable manure. As regards cultivation, trenching to a depth of two feet during the winter is undoubtedly the best plan, and after every crop the ground should be cleared and dug over in readiness for the next. One point to which attention should be drawn is the number of different varieties of vegetables grown. Where grown for market purposes it is distinctly unprofitable to attempt the cultivation of too many kinds, as the mixed produce is never so remunerative as the result of specialised cultures. Endless trouble and unnecessary expenditure is involved when a mixed lot of vegetables are marketed wholesale, although if retailed locally there is no reason why the grower should not endeavour to raise as many kinds as circumstances permit.

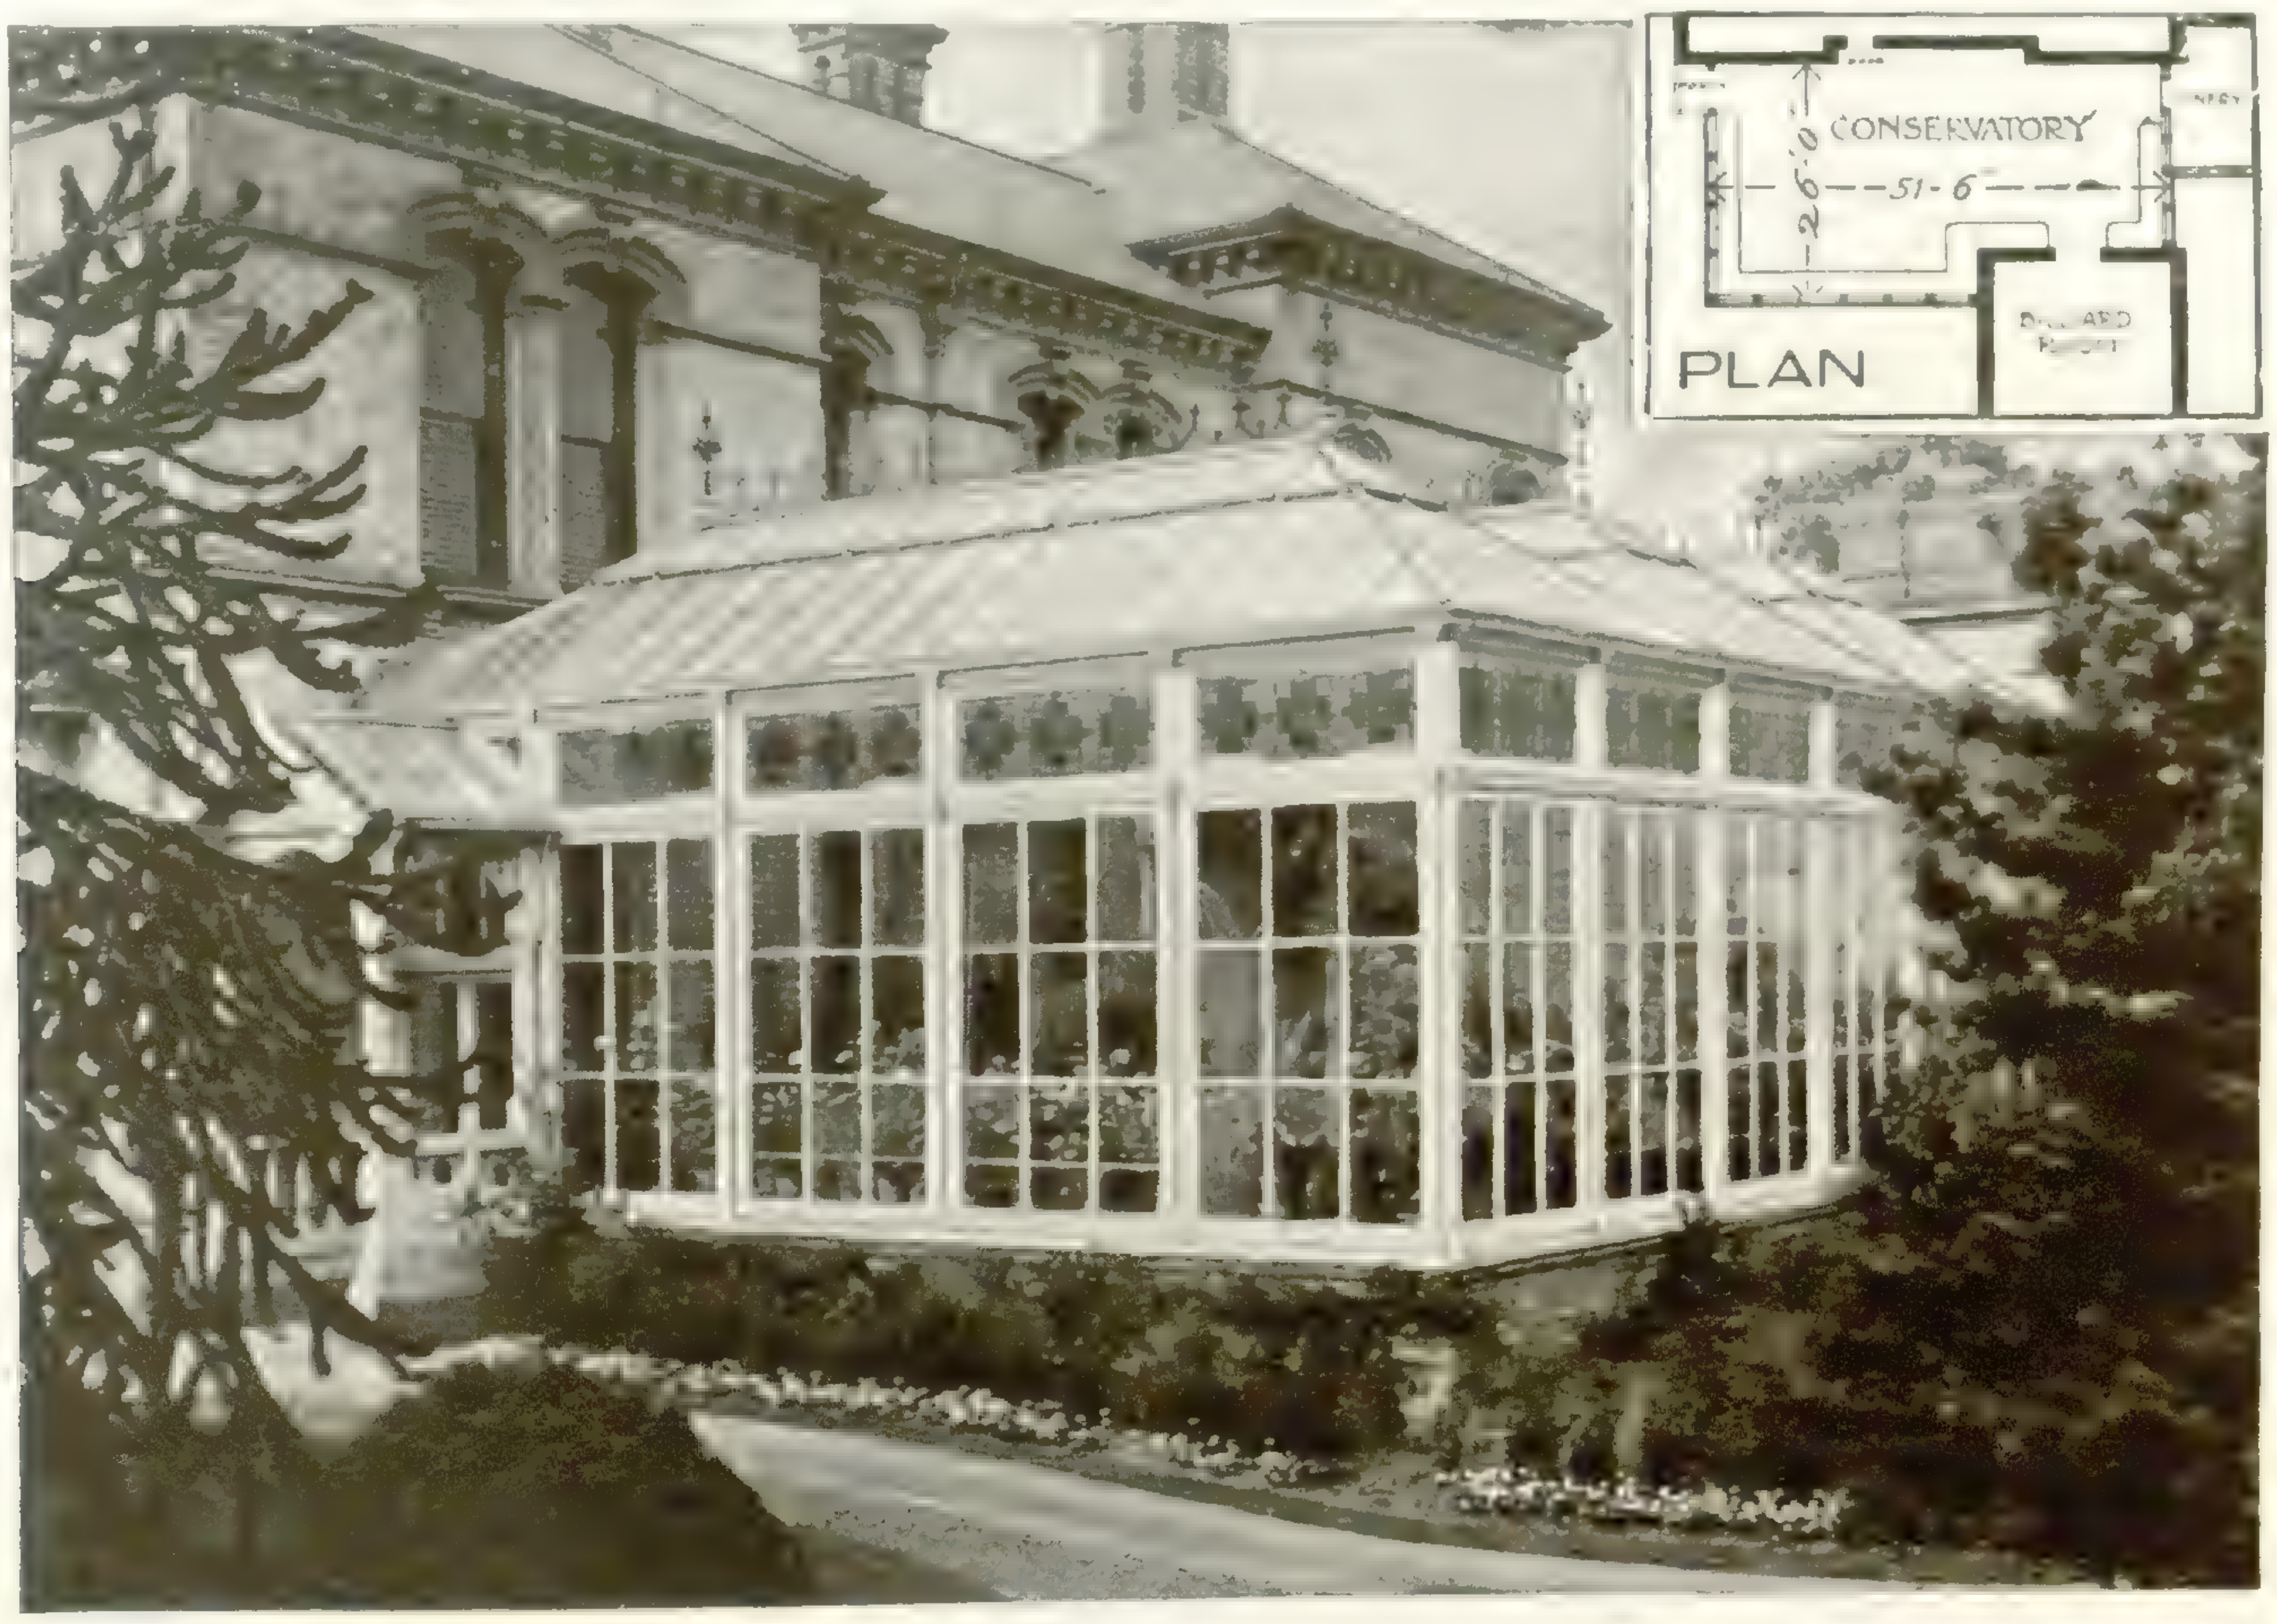
Winter greens include broccoli, borecole, kale, and Brussels sprouts. Kale is undoubtedly a most useful crop for gardens of all sizes, as it suffers least from the severe weather experienced in late autumn and winter. Broccoli plantations should be confined, as a rule, to those sorts which attain maturity before the end of the year, as later varieties rarely survive the Christmas weather. Borecole or kale may be pricked out early in July during showery weather. Broccoli should be got into the ground directly after the pea crops have been cleared. The plants should be inserted firmly about 2ft. or 2½ft. apart, and if protection against frost is desired, they may be covered with frames or dried fern or bracken. Sprouts are usually ready for the table by the month of October, and give a constant supply onwards till March. The plants are benefited by earthing them up slightly after planting, and a plentiful supply of water should also be given so as to avoid a check.

As suitable plots become vacant, cabbages from the first and second out-door sowings should be put out at once, preferably during showery weather, a space of from twelve to fifteen inches being allowed between each plant. To encourage hearting in the earlier varieties of cabbage it is a good plan to tie up the leaves, and if hot, dry weather follows planting plenty of water should be supplied. All spare corners and beds can be profitably utilised for cabbages, as they are extremely useful in the winter months, when there is a great scarcity of greenstuff.

The winter or prickly-seeded spinach should be sown in the warmest and richest soil. This will enable the plants to become thoroughly hardened by the time the frosts of winter have made their appearance. The first sowings can be made at the end of July, and successional sowings may follow in due course throughout August. These sowings should be thinned out at an early date to six, and finally to twelve inches apart in the rows, while those intended for winter use may be left seven or eight inches apart. The hoe must be kept in constant use between the rows, both for the purpose of suppressing weeds and providing moisture for the growing crops, and, if necessary, the winter kinds may be lightly protected with long strawy stable litter against frost. The heads of the flower stems should be cut off as soon as they appear, and it is a good plan to thin out the plants and use the thinnings for the first supplies rather than gather the largest leaves from each plant. Subsequently the leaves may be gathered two or three at a time from each plant as soon as they are large enough for use.

A sowing of parsley in July usually suffices for winter and spring use, and there is no better place than at the foot of a south wall. Seed may be sown in drills one foot apart, and covered with fine mould to a depth of about half an inch. A very general practice is to sow parsley as an edging, but if there is much traffic the leaves are apt to become bruised and dirty. The young plants should be thinned out as soon as they are sufficiently strong, a space of six inches being finally left between them in the rows. When gathering, it is a good plan to cut over the plants when they are old and the leaves no longer tender, as this will induce the growth of fresh tender foliage. Parsley usually benefits from occasional dressings of soot.

J. C. Newsham.



CONSERVATORY AT MOUNTFIELDS, LOUGHBOROUGH.
Erected for the late J. Griggs, Esq., J.P., D.L., by Messrs. Messenger and Co., Lim.

COMPETITIONS OF SKILL.

In agriculture it is quite a common thing to hold competitions of skill in manual processes connected with farming, and it may be said of these that they have done a good deal towards the production of a high standard in expert farm labour. Ploughing matches and hedging, ditching, and thatching competitions are quite common events; and if you go to an agricultural show you will see dainty-looking dairy maids competing with each other in the working dairy, and shoeing-smiths working hard for the prizes that are offered for the making and fitting of horseshoes. It is urged, in fact, by those who are in a position to know, that these competitions of skill are not only a means of education, but they are incentives to young men to make themselves expert in the branch of work by which they earn their daily bread. The complaint is that expert farm labour is declining, and the competitions referred to are looked upon as being a means of keeping up the standard.

Perhaps it is that horticulture does not lend itself to skill competitions to the same extent that farming does, and there may be some other reason, but the fact remains that it is unusual for gardeners to pit their skill against each other in manual processes. Of course, we have shows out of number where the results of skill, in the shape of fruit, flowers, and vegetables, are staged in open competition; but at the moment when horticultural societies are looking for novel and fresh departures the time is opportune for considering whether the skill competitions so common in farming could not, to some extent, be copied in horticulture. I admit that the field is more limited, but a few societies can see possibilities, and the start they have made is evidence that skill competitions in gardening are not out of the question. It may be urged that they already exist in the shape of table decorations at shows, which are an old institution, but this is not quite what I mean, in the first place, because it is not strictly utilitarian; and, secondly, because the choice of material has more than a little to do with the winning of the prize.

Let me then state my case. Back in the early spring I read an account of a village gardening society which has a competition every year in which prizes are offered to men who dig and double-dig a rod of ground in the best and most workmanlike manner. Fancy, a competition in digging; perhaps some may ask, what is there in that? A good deal, when you come to remember that digging, though part of the A.B.C. of gardening, is a manual process requiring skill. A good deal depends upon it, and every winner of prizes at vegetable shows knows how much, but when you see the way that some people who call themselves gardeners handle spades, you realise that there is room for improvement in methods of digging. It must have been a goodly sight in the competition referred to to see stalwart men swinging their brightly-burnished spades, driving the blades down into the ground, bringing up the soil, and leaving the surface as only a good digger knows how to leave it. Surely digging presents as many possibilities for the gardener as ploughing does for the farmer; then why not inaugurate competitions of skill among the men who use spades?

To state another case. Last summer I was asked to judge at a village flower show, where, amongst other things, prizes are given for practical competitions in budding. There were two classes: one for adults and one for boys and girls. The competitors supplied their own briars and buds, and the prizes were given to those who prepared, fixed, and tied in three buds in the most workmanlike manner within a given time. The entries were good, and it was quite interesting to observe the earnest way in which the competitors set about their work, though one or two ladies who entered became nervous and cut their fingers. What I remember most of the competition is that the village postman, who enjoys a local reputation as a budder, won the prize in the adult class, and I think his little daughter, who was champion in the junior division, did her work even more neatly than the father. A good deal of interest was taken in the competition, and I could not help thinking that, from an educational point of view, it was a great deal more useful than offering prizes for the fattest baby, or bowling for a pig.

Allied to budding is the sister operation of grafting, which calls for the exercise of skill and good workmanship. Every locality possesses a few men who are clever at grafting, and when a farmer wants a few trees grafted he sends for the local expert to do them. This is all very well, but grafting is such a simple operation that every village lad ought to know how to do it, and why shouldn't local horticultural societies inaugurate competitions of practical skill in grafting? I make this suggestion on the grounds that grafting is as much a manual process requiring skill as hedging and ditching.

Pruning again possesses possibilities in the way of practical competitions, and I think I remember last spring reading an account of one society, i.e., Newport, Mon., holding a competition in pruning for the benefit of young gardeners. In a pruning competition, I think there should be an oral examination as well as the practical work, and the competitors should be asked to explain why they cut off the shoots and what they expect to get as the result of doing this. I suggest this because a number of men simply learn their pruning by rule of thumb, but without any knowledge of the principles which govern the operation. In some districts in the West of England where orchards are plentiful, and for the most part badly pruned or not pruned at all, competitions in the pruning of orchard standard trees are held, and I believe they have been the means of improving this class of work.

The above illustrations do not exhaust the directions which offer possibilities in the way of practical competitions, and the committees of gardening societies might do worse than consider this matter as being a means of attracting young members and giving them opportunities of displaying their skill as practical gardeners.

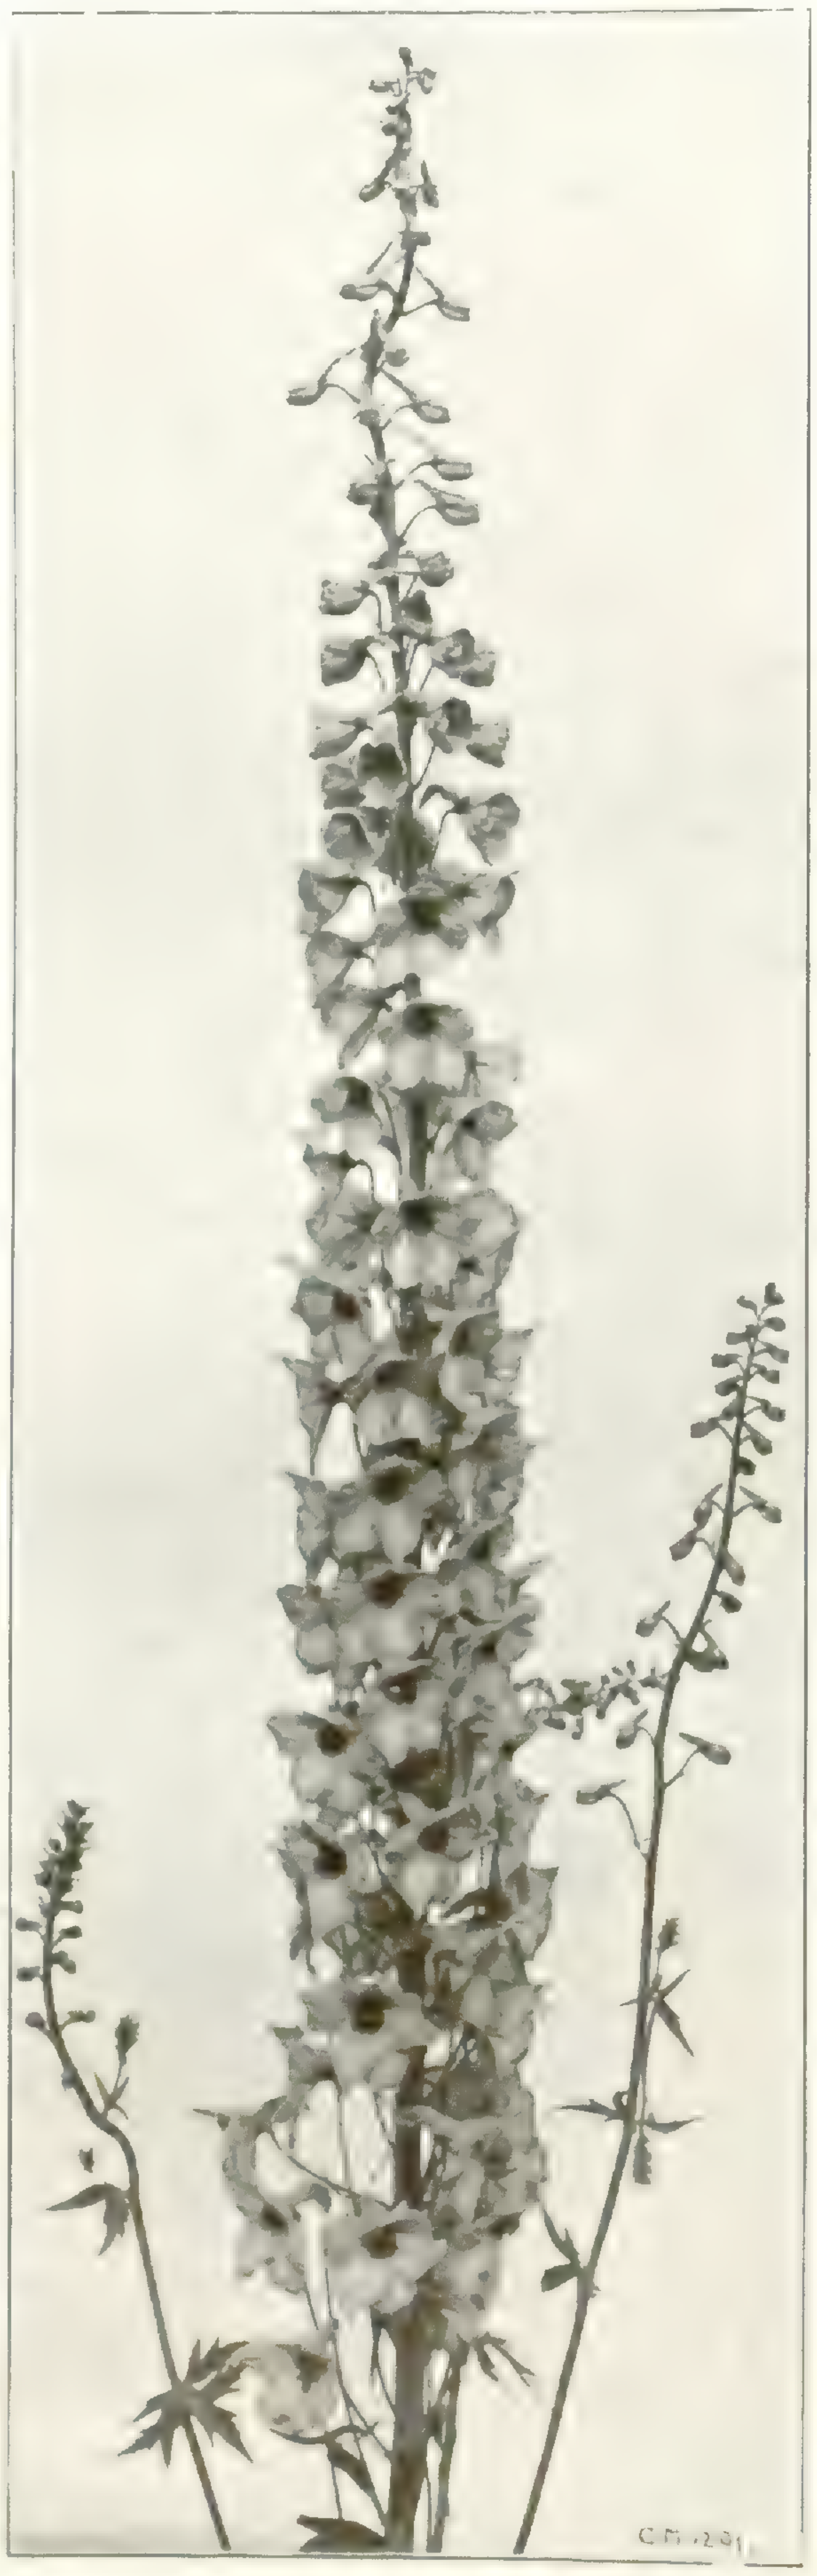
H.

Calceolaria Buttercup.—While the old-fashioned florists' varieties of calceolaria, with their dense masses of large flowers, remain popular with some, there is, on the other hand, a growing tendency to favour those which are of a less formal and more graceful character. Such is Golden Glory, which has proved itself hardy in many districts, and has already become a general favourite. Another is Clibrani, of a quite loose habit, and with a great profusion of clear yellow flowers. A large group of a very pretty form named Buttercup, and announced as the result of a cross between the two before-mentioned varieties was shown at the Temple Show by Messrs. J. Veitch and Sons. It should make a good decorative plant, as it is exceedingly floriferous, grows about eighteen inches high, and is in no way stiff or formal. The colour of the flowers is yellow, dotted freely on the undersides. A notable feature is that the dotting is more pronounced than in either Clibrani or Golden Glory. Probably from the fact that they were seedlings the plants of Buttercup composing the group referred to were not all exactly of the same shade of colour, some being of a deeper and richer tint than others. From the fact that this calceolaria so quickly attains flowering size, and is so showy when at its best, we shall doubtless before long see a great deal more of it.—W. T.

ESCALLONIA LANGLEYENSIS

Many of the escallonias are too tender for outdoor culture except in the warmer parts of the country, but there is one species, E. Philippiana, which stands without injury in most places, whilst another species, E. macrantha, is moderately hardy, and is only injured by exceptionally severe winters. In the hands of the hybridist these two species produced the above hybrid, which is an exceptionally fine shrub, possessing the good qualities of its parents to a marked degree. So far as hardiness is concerned, it may be said to be almost comparable with E. Philippiana, for, after the winter of 1908-1909, which severely tried many shrubs, the wood was uninjured, though all the leaves fell. E. Philippiana is, of course, deciduous, therefore it is not unnatural for its progeny to shed its leaves under certain circumstances, although it may take after the other parent in being evergreen under normal conditions. The habit of E. Langleyensis is peculiarly graceful, the branches being semi-pendant whilst the oval leaves are dark green. The bright rose-coloured flowers are borne in June, and, individually, are somewhat larger than those of E. Philippiana. It is very floriferous, and is an excellent subject for a group on a lawn, for a mass in the foreground of a shrubbery, or for planting against a trellis, where the branchlets can hang freely from the supports. It thrives in loamy soil, and is well worth inclusion in a collection of choice shrubs.

D.



DELPHINIUM PURPLE VELVET.
A distinct and beautiful variety with deep violet-purple flowers. A.M., R.H.S., June 21. Messrs. Kelway and Son.

NEW PLANTS, ETC.

◆

ODONTIODA VUYLSTEKEÆ WALTON GRANGE VAR.

A handsome and brilliant crimson-scarlet variety of the fine bigeneric hybrid between Cochlioda Noetzliana and Odontoglossum Pescatorei. A.M., R.H.S., June 21. Mr. W. Thompson, Walton Grange, Stone.

DELPHINIUM.

Purple Velvet.—A splendid single variety with very large spikes of big, rich, deep violet-purple flowers. A.M., R.H.S., June 21. Messrs. J. Kelway and Son, Langport.

IRIS.

Albo-purpurea Colchesterensis. — A handsome form of a well-known iris; it has broad reflexing segments that are quaintly and beautifully marked with bright purple-blue and white. A.M., R.H.S., June 21. Messrs. R. Wallace and Co., Colchester.

Fulvata.—An interesting hybrid between I. fulva and I. alata. The flowers are spreading, and have slightly recurved segments finely marked with purple and copper colour. A.M., R.H.S., June 21. Mr. W. R. Dykes, Charterhouse, Godalming.

ROSE FREDA.

A fragrant hybrid tea rose with shapely, deep rose-coloured flowers of good size, shaded with rose-red. The form of the flowers is very good. A.M., R.H.S., June 21. Messrs. Paul and Son, Cheshunt.

SWEET PEAS.

Dobbies' Sunproof Crimson. — A large waved variety of deep and bright crimson-scarlet colour, and said not to burn or scald in bright sunshine. A.M., R.H.S., June 21. Messrs. Dobbie and Co., Edinburgh.

Ivanhoe.—A waved variety of good size and form; soft lavender. A.M., R.H.S., June 21. Messrs. Dobbie and Co., Edinburgh.

KALANCHOE KEWENSIS VAR. EXCELSIOR.

A showy succulent plant, two to two and a-half feet high, with divided, fleshy leaves and a terminal, branched head of deep crimson-scarlet flowers. A handsome form and a fine companion to K. flammea. A.M., R.H.S., June 21. Messrs. Jas. Veitch and Sons, Chelsea.

STRAWBERRY MARK TWAIN.

A conical variety of medium size, bearing its fruits freely in tall, much-branched clusters. These are bright scarlet with light flesh and good flavour. The variety is distinctly earlier than Royal Sovereign, and is said to crop well. A.M., R.H.S. Mr. F. B. White, Old Netley.

Rose Frau Geheimrat Dr. Staub.—This is an early-flowering rose of the H.T. section, therefore valuable; it has dwarf stocky growth, and the blossoms are shapely, reminding one of Liberty when in bud. The colour is deep brilliant red, with a darker shading, and the flower is also sweetly perfumed. This variety was introduced by Lambert in 1908.—E. M.

THE SUMMER PRUNING OF FRUIT TREES.

For many years past experienced fruit growers have, both in nursery and private gardens, done a great amount of pruning during the summer months with excellent results. I find that many young gardeners —and some older ones, too—are practically ignorant as regards the actual carrying out of the work and its beneficial effects. And I also find that there is some difference of opinion amongst others as to the manner and time of pruning.

Although pruning at the present season will considerably improve the strong-growing tree, it is not all that is necessary to be done to it. Root-pruning in the autumn must follow. Then the most stubborn specimen can be brought and kept under control and in a fruitful state year after year.

Summer-pruning may be done throughout the month of July; but if I had to deal with very strong-growing trees, I would defer the work until the end of the month, commencing with weaker-growing specimens early in the month.

If the former be pruned too early a good deal of trouble will be given by the sub-lateral growths later on, as they will form persistently until quite late in the season. I do not like to see more than one batch of these sub-laterals grow after the pruning has been done, as it proves that the wood is very immature. It would be a different matter if they formed persistently any time previous to midsummer, and summer-pruning at that time would be too early. In cutting back the shoots four, five, or six buds should be left at the base. If a tree be gross in growth leave six buds, five if of medium strength, and four if of rather weak growth.

The resultant sub-laterals should be pinched out when just large enough to handle, then many trees can be dealt with in a very short time. It would be a big mistake to neglect to remove the sub-laterals, as they would cause overcrowding, a thicket of growth which would shut out light and sunshine from the leaves, basal buds, spurs, and fruit. Only the end, or two end buds on the cut-back shoot would grow at once if the summer-pruning be done as suggested; but if closer pruning be done the basal buds may grow, and this would be disastrous.

There are many small sappy shoots on fruit trees, such as apples, pears, plums, and apricots, that may be pinched off rather close back, and thus be prevented from causing any overcrowding, and such shoots never mature. Trees so treated do not require extensive winter-pruning.

Geo. Garner.

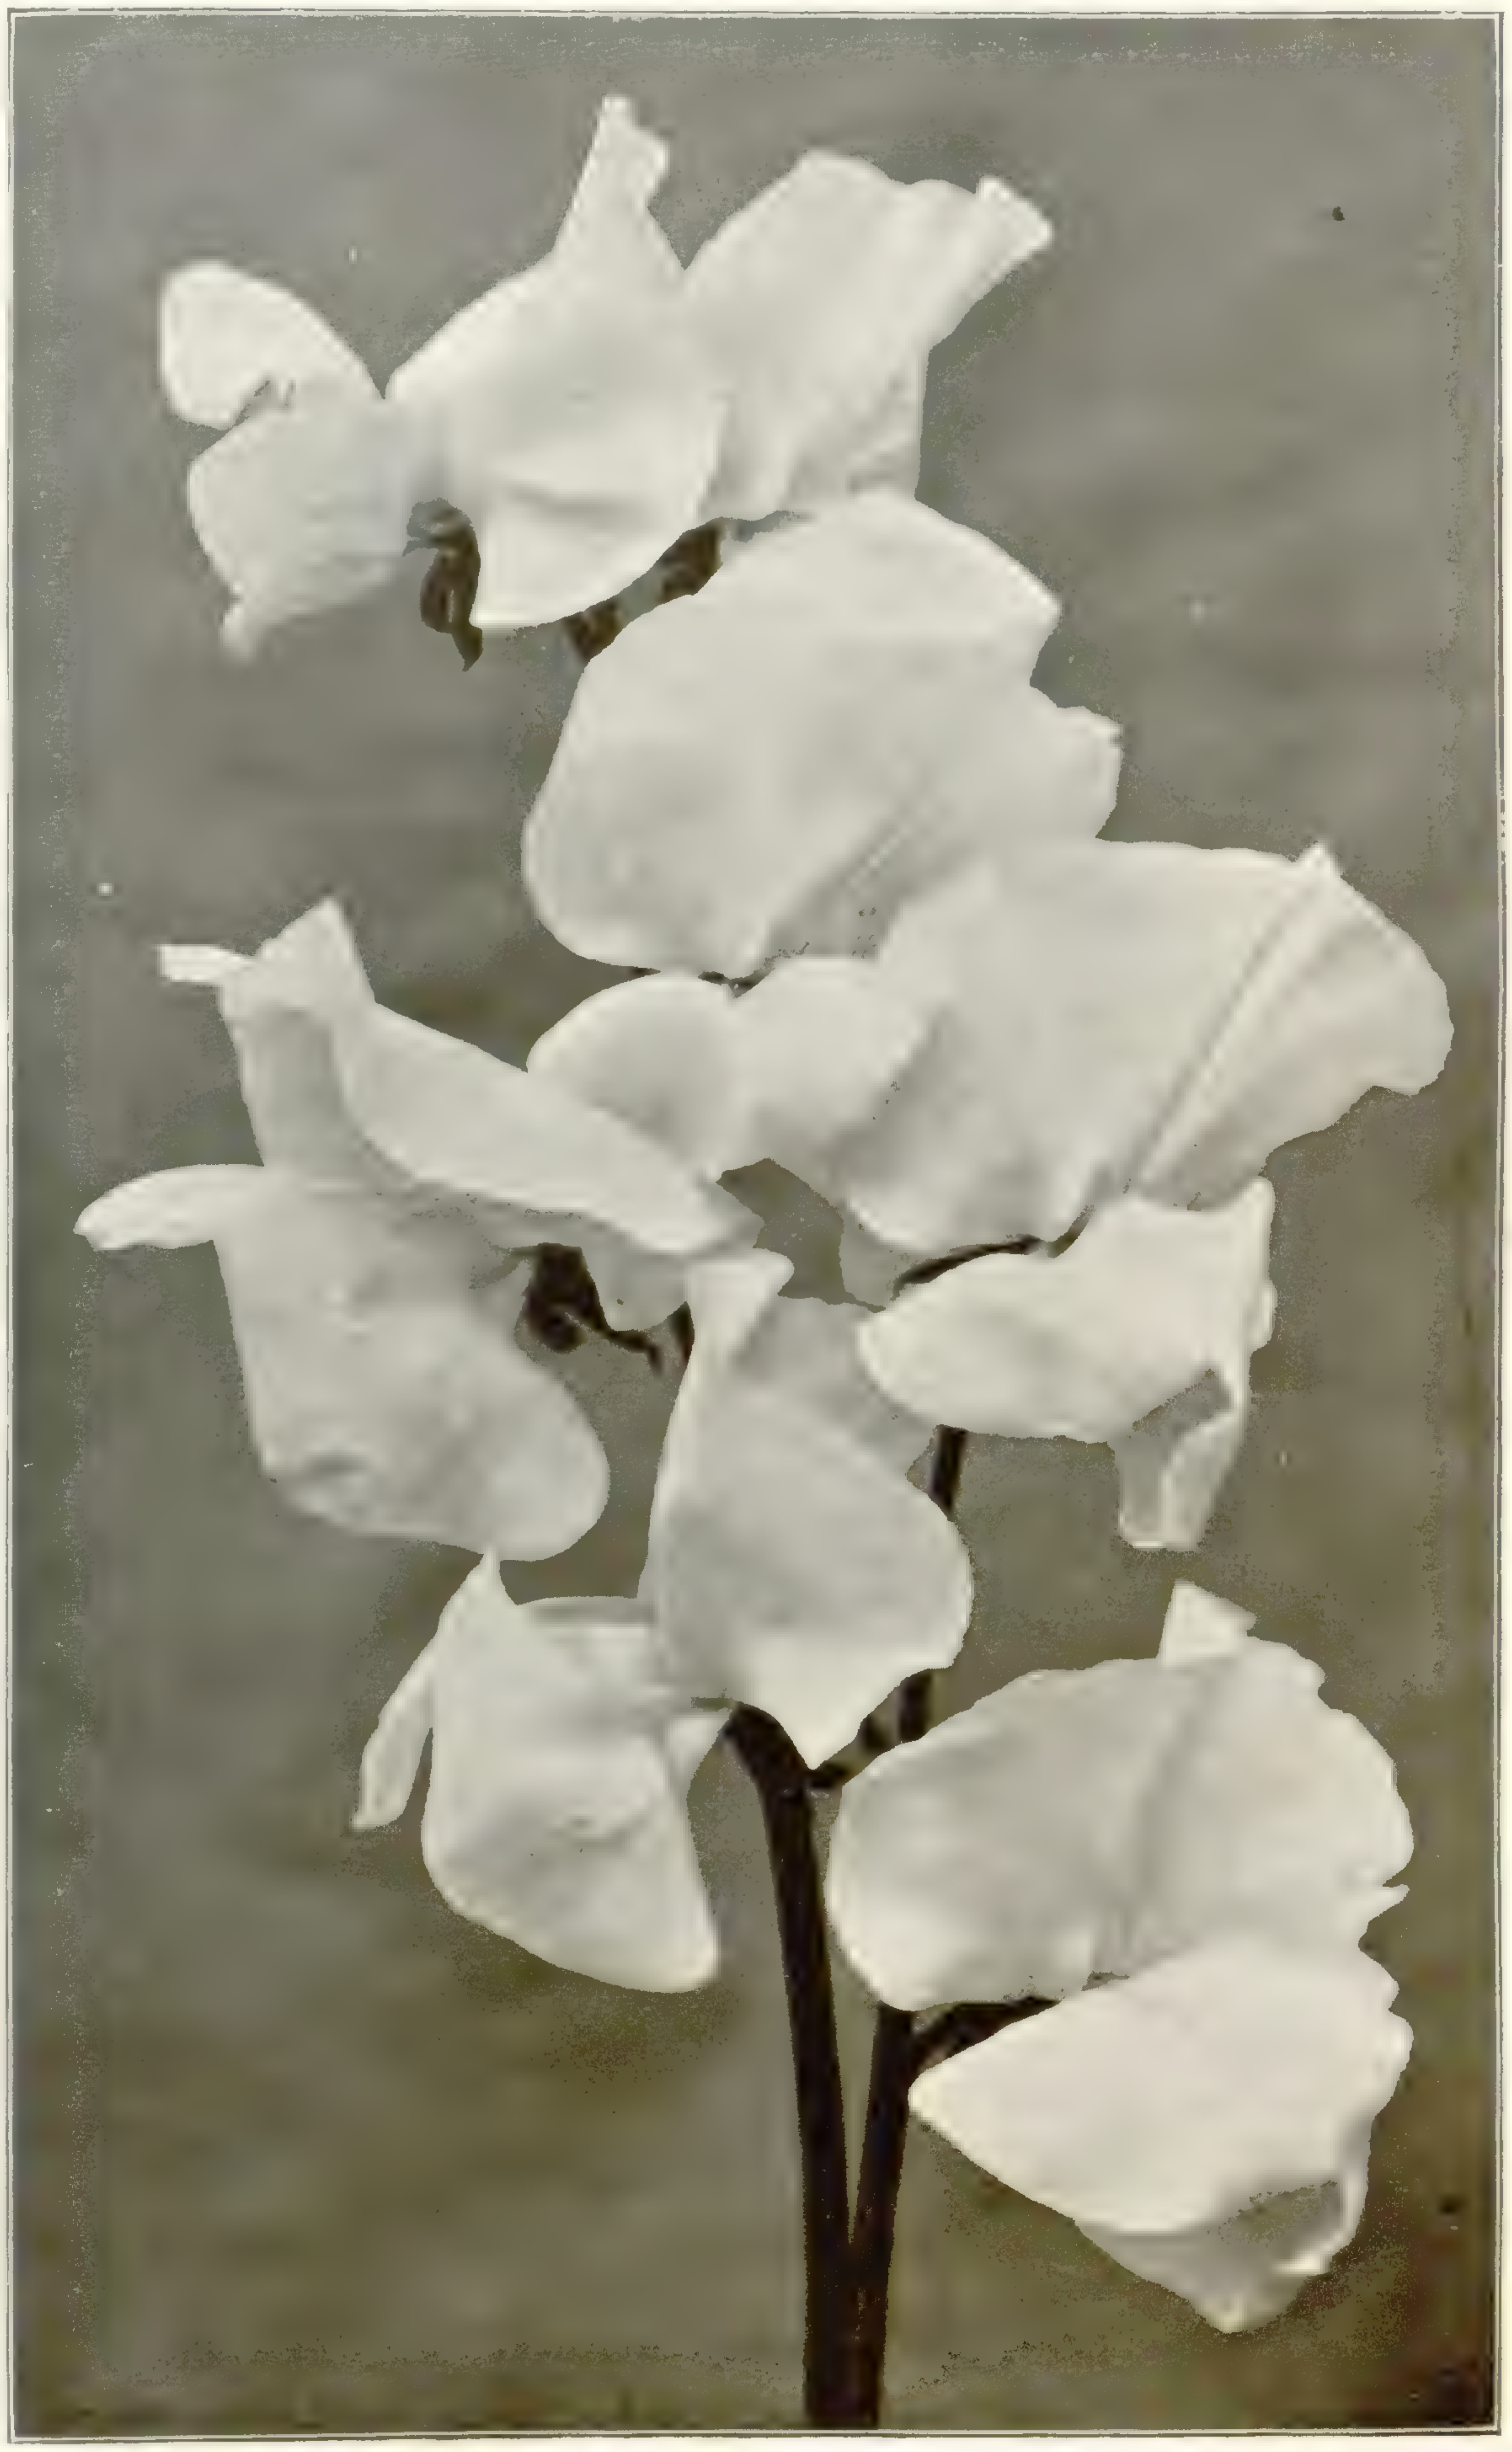
Meuhlenbeckia complexa.—Slender, graceful, and dainty in appearance, yet tough as wire, and hardy as the heather, this handsome little trailing shrub is a gem for the rockery or for overgrowing an old tree stump, clothing a sloping bank, or perhaps, best of all, as a subject for the wall garden. The shining black stems hanging over the face of the wall are furnished with small green leaves in pairs from end to end, and an established plant is remarkably pretty. It needs neither pruning nor training, but should just be allowed to grow, and throw its graceful stems where it will. Meuhlenbeckias like a deep, light soil, and thrive the better when afforded some peat or leaf-mould, and a little lime rubbish or sharp sand. It is easily propagated by means of cuttings of the ripened wood in autumn. These should be cut at a joint in pieces about the length of one's finger, and dibbled into sandy compost under a handlight or round the edge of a six-inch pot.—M. A. C.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

MILTONIA VEXILLARIA.—The different varieties of the early-flowering M. vexillaria will now have passed out of flower, and where a house is not devoted to their cultivation it is advisable the plants should be removed to a cooler atmosphere than that of the intermediate house. A shady position at the warm end of the odontoglossum house suits them well. The plants should not be over-watered for the next few weeks, only sufficient root moisture being given to keep the pseudo-bulbs plump. Keep a sharp look-out for thrips, as these insects are the worst enemies of miltonias, and every precaution is needed to keep the plants free from them. Dipping at regular intervals in a safe insecticide, and occasionally vaporising the house are the best means of keeping insect pests in check at this season of the year.



SWEET PEA IVANHOE.
A beautiful variety, the flowers large, and the colour soft lavender.
A.M., R.H.S., June 21. Messrs. Dobbie and Co.

ODONTOGLOSSUM CITROSMUM, as it passes out of flower, should be repotted if necessary. When repotting this species it is most desirable the compost selected should consist of lasting material. For a good portion of the year the plants are in an absolutely dormant condition, and require very little moisture at the roots. It is only through the growing season that ample moisture is needed, so that if a suitable compost of a lasting nature is selected the plants will last for some time without disturbance. After repotting give every encouragement for the proper development of the new pseudo-bulbs.

CATTLEYA CITRINA is another orchid which I consider takes a long period of absolute rest as soon as growth has developed;

this, however, is not for some considerable time after flowering. The plants that have recently passed out of flower will be now rooting freely from the base of the developing growth, and should now be top dressed or repotted as necessary. These plants do not require much compost about their roots, so that whatever receptacle is used ample drainage must be given. I find a few broken leaves mixed with the peat is beneficial to C. citrina. Examine the plants for scale and other insect pests at this season, for if the young growth becomes infested trouble will follow. There can be no doubt but that plants of C. citrina are benefited when they can be placed in the odontoglossum house for a few weeks after they have completed their growth. The moist and cool conditions there will then suit them.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

FERNS.—Most of the ferns that were potted early in the year will now be well furnished with young roots, in fact most of the strong-growing varieties will have well filled their pots, and where good specimens are required for autumn decorations some of the best should be potted again, this particularly applying to such varieties as Pteris serrulata major, P. tremula, Nephrolepis exaltata, N. Piersoni, N. todeaoides, N. elegantissima, N. Whitmanni, etc., as well as blechnums, Lomaria gibba, etc. The latter grow very freely, and make fine young plants if raised from spores, say, every second season.

ADIANTUMS AND ASPLENIUMS should not require a second potting, as frequent waterings with liquid manure will keep them growing freely, and an occasional supply of artificial manure will not be out of place.

LYGODIUM SCANDENS I find a very useful (climbing) fern for table decorations, but care must be taken during the growing season to train the young growths separately to strong cotton or fine string, much in the same way as smilax. Also young seedlings of this latter useful plant should be potted on, and placed at the ends of the houses or at the backs of some of the lean-to houses, where they may be strung; they should produce some good trailers to follow on after the older plants have been cut over. A batch of smilax seed should now be sown, and if the young plants are kept growing till the autumn they will be found most useful during the early spring and summer, at a time when it is somewhat difficult to obtain good trailers for the dinner table when only one sowing is relied on.

SHADING.—Most ferns prefer a fair amount of shade, and where the houses are permanently shaded it may, on very hot days, be necessary to supplement this for a few hours with mats or tiffany, where there are no roller blinds. As mentioned in these notes of June 18, fire heat may be entirely dispensed with for a time, but if this is done in the ferneries it may be advisable to leave a little top air on at night, or the accumulation of moisture on adiantums may cause damping of the young fronds.

PALMS.—These generally will be growing freely, and where kept in fairly small pots will require to be well supplied with water, and an occasional top dressing of patent manure will help keep them vigorous and green. Keep them well syringed, and whenever the opportunity offers sponge them over; in most gardens these are grown chiefly for the decoration of the rooms, and if kept clean they are ready to go indoors at short notice. It is as well to purchase a few small plants each season from the nurseryman, selecting those kinds most in demand; the first cost is not much, and the plants gradually grow on and take the place of those that become shabby through use in the house, whereas if large palms have to be bought they are a very expensive item.

ACHIMENES.—These will now be making a good show, or should be doing so shortly, and as the flowers begin to expand give them a little more air, and just now they will take any amount of water, not forgetting liquid manure, as they revel in it, and, if not allowed to become dry, they will go on blooming for a considerable period; keep them carefully staked and tied as advised in a previous calendar.

GLOXINIAS.—As the earlier batches of these go out of bloom they should be put into a pit, where they should still be supplied with water until the leaves begin to show signs of maturing, when it may be gradually withheld. Young seedlings must still be kept growing freely, giving them all the encouragement possible to make good leaves, as well as to produce flowers, but a 48-sized pot is quite sufficient the first season.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

LATE MELONS.—Successional batches for affording late supplies of fruit should be planted as they become fit, in light, adequately heated pits or houses. Should they be replacing melons or other crops subject to red spider particular pains should be taken in cleansing the structure with a solution of soft soap and paraffin, and in the case of melons the old compost should be removed. Place the plants two feet apart upon firm hillocks or ridges of fresh compost, and train them as single cordons upon a trellis placed near the glass. Afford a night temperature of 70 to 75 degrees, and keep the atmosphere moist by damping the floors, etc., several times daily, and by syringing in sunny weather, early in the morning, and again when the house is closed for the day. At such times the house should be closed sufficiently early to cause the temperature for a short time to reach about 90 degrees. Stop the leading growth of each plant when it reaches its desired length, the laterals at one leaf beyond the first fruit, and subgrowths at one leaf, and secure them to the trellis. While in blossom discontinue syringing, keep the atmosphere circulating and fairly dry, and fertilise the flowers. As soon as the fruits have set and are swelling select on each plant enough of them of about equal size for the crop, and remove the rest; resume syringing, etc., and keep the plants well supplied with water and diluted liquid manures. Sow seeds at the end of July for the latest crop.

MELONS IN FRAMES.—Grown under these conditions melons are more difficult to manage than where fire heat is employed, and especially so in cold or wet seasons. Essential points are the maintenance of necessary warmth by adding linings to the fermenting material, entrapping the sun's warmth by closing the lights early in the afternoon, and covering the lights with mats on cold nights. Moisture for the roots, or syringing, must be used with good judgment. The growths should at no time be crowded, and stopping the shoots should be done at an early stage of development. With a view to prevent canker it is desirable to rest the growths upon bricks placed at suitable intervals apart, to keep them off the soil, and the soil near to the main stem should be kept dry. The fruits should also be raised either upon flower pots or half bricks. If canker appears the affected parts should be rubbed with quicklime and kept dry.

SCALDING AND SPLITTING OF GRAPES.—In some instances it is difficult to prevent the berries of grapes, Lady Downes, for example, from being scalded during the time they are stoning, and this is most likely to happen during powerful sunshine, when moisture has condensed on the berries. The means to adopt to prevent it is to maintain from fire heat a night temperature of about 70 degrees, leaving the ventilators slightly open, and preventing sudden rises of temperature from sun heat by a timely increase of ventilation. In some badly-constructed houses it may be found expedient to slightly shade the glass. We usually have some difficulty in this respect in the case of a house of Lady Downes, but last season, as the weather was dull during the stoning period, no scalding took place. Splitting, to which Madresfield Court and some other varieties are liable, may be caused by an excess of moisture in the atmosphere, or by wet weather outside, especially if this occurs after the grapes have been tolerably dry for a period, or the trouble may occur owing to the borders being watered or wetted by rain after they have been allowed to become dry. In the first case means similar to those recommended as a preventive to scalding should be followed, and watering inside borders should be done in the early part of a fine day, when the ventilators are well opened and the extra moisture can escape. In the other case keep the borders properly supplied with water, and, if necessary, protect outside borders from excessive rainfall.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

LEEKS.—The early planted leeks should now be growing freely, and require regular earthings up, and occasional waterings. Liquid farmyard manure is preferable to any other feeding. The later-sown batch should now be ready to plant out; in this case holes can be made in firm ground six inches deep, placing the leek at the bottom of this with soil enough to cover the roots only; as the plant gradually grows add more soil until eventually the hole will be filled to the surface level; if a greater length is needed additional soil can be drawn up in the form of a ridge.

CARROTS.—Few vegetables are in greater demand than these when young, therefore every endeavour should be made to procure them by sowing at fortnightly periods from now until the end of September. Those sown at the later dates should be placed where a garden frame can be laid over them, and nice little carrots can then be pulled until March. Every care and attention must be given them during the late autumn by regularly sowing soot, and at other times lime, to prevent slugs, etc., from destroying them. First-rate kinds for this work are Sutton's Inimitable and French Forcing.

PEAS.—Another sowing should be made at once, as, should we have a good autumn, the crop will be found valuable. Trenches, well prepared as previously advised, will be necessary, and regular waterings must be given should the weather remain dry. If all the late varieties of seeds have been sown, and there are some early kinds on hand, do not hesitate to sow these; we have gathered in eight weeks from sowing that fine variety Sutton's Early Giant, sown at this season. Well water and mulch all the main crops to prolong their cropping powers to the utmost.

SPINACH.—Especial care will have to be taken to procure good spinach now, particularly on shallow soils. To be successful sow regularly every fortnight on well-prepared ground where some amount of shade can be obtained, as between rows of tall peas, runner beans, or near high north walls.

BEANS.—Stake runner beans early, and make one more sowing. Dwarf beans can be sown fortnightly for some time to come; the variety Waxpod is very popular in some establishments.

LETTUCE AND ENDIVE.—Sow further good breadths now, as by the time they are mature they will be found to stand in good condition for some time. If transplanting is practised well shade, water, and regularly spray the plants until established.

CELERY.—Though not often ready for use until September, very fine celery can be had by the middle of August if the early sowing is given regular attention. It will be found to blanch more readily now than later, five weeks being ample, whereas ten weeks are required for the autumn and winter supply. If a few fine heads are required nothing is better than the use of brown paper bands four to five inches in width, and long enough to go round the whole plant three times. Continue this treatment every ten days until the desired height is obtained; water regularly, and keep a sharp look out for slugs and the celery fly. Dust frequently with soot to ward these off.—G. Ellwood, Swanmore Park Gardens.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY. 22nd Annual Show. SOPHIA GARDENS, CARDIFF. WEDNESDAY and THURSDAY, July 20 and 21st, 1910. Liberal Prizes in every section, amounting in money and plate to nearly £500. Two Programmes of Music each day by His Majesty's renowned 1st Life Guards Band. A Grand Display of Fireworks each evening by Messrs. W. and J. Wilder, Birmingham. Mr. John Studt's up-to-date Fun of the Fair, each day. Tents lighted by the Blanchard Patent Incandescent Oil Lamps. Popular prices. Tickets and Schedules may be obtained from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

HANLEY PARK, STAFFORDSHIRE.
July 6th and 7th, 1910.

FOURTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes, Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for "TRADE EXHIBIT"
(For particulars see page 10 in Schedule).
Valuable Special Prizes offered by the principal Firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.

Schedules, post free, on application to
WM. POULSON, Secretary.
Town Hall, Hanley.

NORTHAMPTON MUNICIPAL HORTICULTURAL & ORNITHOLOGICAL SOCIETY.

GRAND EXHIBITION OF
FLOWERS, FRUITS, and VEGETABLES,
BEES, BIRDS, POULTRY, and RABBITS.
AUGUST 3rd and 4th, 1910,
At
ABINGTON PARK, NORTHAMPTON.
Prizes to the Value of £300.

Schedules on application to
JAS. B. PALMER, Secretary,
36, Cyril Street, Northampton.

SALTAIRE, SHIPLEY, AND DISTRICT
ROSE SOCIETY.
EIGHTH ANNUAL EXHIBITION OF ROSES AND SWEET PEAS, TUESDAY, July 19th.
TROPHIES and MONEY PRIZES to the Value of £450 OFFERED for COMPETITION.
Schedules and further particulars from
E. WRIGHT, Rosedene, Shipley Glen, Saltaire.

THE FOUR NORTHERN COUNTIES, FRUIT CONGRESS and SHOW, HEXHAM, 20-22 October, 1910. Particulars of space for Trade Exhibits from the General Secretary, Rev. J. BERNARD HALL, Hon. F.R.H.S., Dalston, Cumberland.

THE GREAT ROSE SHOW
OF THE YEAR
Will be held by the NATIONAL ROSE SOCIETY
in the
ROYAL BOTANIC GARDENS.
REGENT'S PARK, N.W.,
ON FRIDAY, JULY 8TH.

The two Champion Challenge Trophies will be competed for, also numerous other Cups and Pieces of Plate, and Money Prizes to the value of £400.

NEW SEEDLING ROSES in a SEPARATE TENT.

TWO MILITARY BANDS.

Luncheons, Teas, and Other Light Refreshments.

ADMISSION—
Noon to 3 p.m., 5s.; 3 to 5 p.m., 2s. 6d.; to 7 p.m., 1s.

E. MAWLEY, Hon. Secretary,
Rosebank, Berkhamsted.

NATIONAL SWEET PEA SOCIETY. The TENTH EXHIBITION will be held at ROYAL HORTICULTURAL HALL, July 12th and 13th. Entries close July 6th. Join at once. Minimum Subscription, 5s. "Sweet Pea Annual" and Official Catalogue of Sweet Peas, 2s., post free, to Non-members. Free to New Members. CHAS. H. CURTIS, Hon. Sec., Adelaide Road, Brentford, Middlesex.

PORTSMOUTH HORTICULTURAL SOCIETY SUMMER SHOW. SWEET PEAS, ROSES, and CARNATIONS, to be held on the SOUTH PARADE PIER, WEDNESDAY and THURSDAY, July 13 and 14, 1910. All communications to the Secretary, W. E. GILL, 80, Osborne Road, Southsea.

REIGATE ROSE AND SWEET PEA ASSOCIATION.

The ENTRIES for the ANNUAL EXHIBITION to be held at BROKES LODGE, REIGATE, on WEDNESDAY, July 6th, CLOSE on MONDAY, JULY 4th.

R. E. WEST, Hon. Sec.,
Frith Dene, Reigate.

WOLVERHAMPTON
GREAT FLORAL FETE.
12, 13, and 14 July, 1910.
£900 IN PRIZES.
Entries close 4th July.
Schedules on application to the Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Oxford, JUNE 21.

On the above date, and in brilliant weather, the Royal Oxfordshire Horticultural Society held its eighty-first midsummer show in the beautiful gardens at Trinity College, Oxford, and florally regarded was a success. In consequence of the death of King Edward VII., the University authorities cancelled all the festivities usual at the end of the academic year during "Commemoration Week," the flower show being one of the many events crowded into that eight days' space.

As the horticulturists had been for some months preparing for "commem.," as it is usually called, the committee did not feel justified in withholding the show, although they realised that financially the show must be a loss. Entries in competition were fewer than usual, but some "extras" assisted in making-up a very pretty and interesting exhibition.

In the plant section the display of orchids and other rarieties arranged by Mr. W. Balmforth, gardener to F. M. Ogilvie, Esq., The Shrubbery, Oxford, formed one of the best features of the show. The group, which occupied the centre of a large marquee, filled nearly 400 square feet, being gigantic in proportion and magnificently arranged. The central circular mound, 15ft. high, crowned with a feathery palm, was formed of graduated tiers, composed mainly of Lælio-cattleya Canhamiana, L.-c. Endora, choice varieties of Cattleya Mossiæ and C. Mendeli, comprising some two hundred flowers; the lovely white form of C. Dusseldorfi and C. Mrs. Peeters occupied spaces on either side. Below were mounds of exquisite forms of Miltonia vexillaria grandiflora, and M. v. The Bride, almost pure white; M. v. Cobbianum and the fine hybrid M. Bleuana. At each end of the group, running from the central group to the tent poles, a scheme was carried out with bridges of cork bark supporting a number of rich forms of Odontoglossum crispum, whose graceful spikes of white bloom were telling amid ferns and delicate foliage. Almost under the arches were groupings of Cypripedium callosum Sanderæ, and C. Lawrencianum Hyeanum, which gave a very pleasing effect, their green flowers showing to great advantage. The boundary of the design had eight similar mounds, arranged with crotons and aralias as dot plants, the bases being used for a general variety of orchids and foliage plants, such as Cypripedium Lawrencianum, C. Curtisi, C. callosum, and C. Honoria; Cattleya Mendelli, C. Mossiæ, and C. gigas, Læliocattleya Canhamiana, and L.-c. Semiramis, Thunia Winniana, Epidendrum prismatocarpum, Odontoglossum crispum, O. crispo-Harryana, and O. excellens. One specimen of Epidendrum prismatocarpum, carrying fully a dozen spikes of bloom, was most noticeable. A gold medal was awarded.

A very good collection of American tree carnations came from Mr. John Johnson, Garsington, in which Britannia, Robert Craig, Lady Bountiful, White Enchantress, Mikado, and Enchantress were prominent. A silver-gilt medal was awarded. Sweet peas were very beautifully arranged for table decoration by Mr. R. Sydenham, Birmingham; Mr. John Cooper, Hardy Plant Nursery, Chipping Norton, set up a variety of violas; and Mr. J. Johnson staged a collection of paeonies and delphiniums; Messrs. Heath and Sons, Cheltenham, and Messrs. R. Tucker and Sons, Oxford, each arranged neat examples of rock and water gardens. Mr. G. Hollingsbee, gardener to Captain A. G. Russell, Holton Cottage, Wheatley, Oxford, put up a collection of carnations in pots, but the varieties were limited.

In the competition, Mr. John Walker, Thame, led in the classes for single and double zonal pelargoniums, cut zonals, and iris. The roses, both displays and cut flowers, were excellent, but the heat tried them toward afternoon. Mr. John Mattock won the £3 for a display, with Mr. Prince second; but for twenty-four blooms and eighteen teas, Mr. Prince headed the list, Mr. W. T. Mattock gaining premiers for eighteen roses, table decorated. Mr. H. Mount, University Parks, Oxford, put up the premier collection of nine British ferns, noble specimens and choice varieties.

Hardy perennials made a rare show; there were three competitors, each with 72 square feet of space, Mr. Johnson, Garsington, leading. In his arrangement were noble spikes of eremuri and very choice paeonies, etc.; Mr. J. Cooper second; and Mr. J. Walker third. Groups of begonias were pretty, but those on view did not attain to any high degree of quality.

Table decorations were a goodly feature, and in the amateur division eleven competed, Mr. F. Lowe (assistant secretary) scoring a premier in the members' division, and Miss E. M. Johnson, Beech Lawn, Sunnymeade, Oxford, in the ladies' class; carnations, Iceland poppies, aquilegias, climbing roses, and cattleyas were used with gypsophila, grasses, fern fronds, smilax, and selaginella.

Fruit was a small display. Mr. S. Brown, Aynho Park Gardens, led for white and black grapes, peaches, and a melon; Mr. C. E. Munday, gardener to Right Hon. Lewis Harcourt, M.P., scoring first for nectarines and cherries. The finest strawberries came from the Headington district, the Wick Nursery Company leading; Miss M. L. Mortimer, Red Gables, second. Mr. J. Wiblin, Northern House, Oxford, won first for cucumbers, and Mr. R. Wadham, gardener to Mrs. Bradshaw, The Grange, Steeple Aston, headed the list for tomatoes and a collection of vegetables, staging Up-to-Date potatoes, Champion Scarlet Horn carrots, Superlative dwarf beans, Best-of-All tomatoes, Magnum Bonum cauliflower, Reading Giant asparagus, and Early Giant peas. Amateurs and cottagers produced average exhibits of strawberries and a general run of vegetables.

Liverpool Flower Show.

MISCELLANEOUS EXHIBITS.

The pressure on our space in the issue of June 25 compelled us to leave over a part of the report of the great flower show that was held at Liverpool in conjunction with the exhibition of the Royal Agricultural Society. The portion that was crowded out we have now the pleasure of giving.

From Guernsey Mr. Frank Lilley brought over a charming lot of early-flowering gladioli, English and Spanish iris, ixias, and anemones. The King's Acre Nurseries, Lim., Hereford, arranged on an improvised rockery a variety of alpine plants, among which the choice little Viola gracilis was flowering well. Corydalis Wilsoni and Primula Bulleyana were also represented. The same firm showed pæonies, pyrethrums, delphiniums, and other border flowers. Quite like old times were the fancy pelargoniums put up by Mr. W. J. Godfrey, Exmouth, who showed them in about thirty varieties of his own raising.

Mr. A. J. A. Bruce, Chorlton-cum-Hardy, had a capital group of quaint and beautifully-tinted sarracenias.

Messrs. George Massey and Sons, Spalding, appeared to have selected all the most charming and delicate shades that are to be found among pæonies, and arranged in a good bank the effect was delightful. "Very bright and very effectively staged" was a comment made more than once by those who stood before Messrs. Dickson and Robinson's big group of pyrethrums, carnations, and other good things. J. N. Twerdy, Sherlock, and Vurd were three among the best of the pyrethrums. Mr. Robert Bolton's sweet peas were a really splendid lot of flowers in most charming varieties.

Quite a model orchard came from the King's Acre Nurseries, Lim., pyramid and standard fruits being surrounded by cordon currants and gooseberries carrying good crops. The now well-known Viola cornuta purpurea was shown by Messrs. Gunn and Sons, Olton, Birmingham, who had several other pretty violas. Mr. Henry Middlehurst, Liverpool, had some good sweet peas and a grand lot of English iris, arranged on a stand draped with white material and festoons of smilax—rather a pleasing style. Some big and somewhat heavy floral designs were shown by the Messrs. Bees, Lim., Bold Street, Liverpool.

SEEDSMEN'S PAVILIONS.

Messrs. Sutton and Sons, Reading, occupied their accustomed position to the right of the main entrance, and their palatial pavilion was continually crowded with interested visitors. Shielded from wind and dust by a glass screen, a beautiful group of begonias and gloxinias occupied the place of honour, and the extensive collection of Nature study specimens, which has already been described in our pages, was arranged on tables and walls and on revolving stands. Vegetables, sweet peas, and an excellent strain of mignonette added the necessary touch of brightness. Messrs. Harrison and Sons, Leicester, had among a number of good vegetables the Early Bunching carrot, so named because considered to be the earliest outdoor cropper; Ameer pea, an early variety of medium height, was shown. Samples of well-known peas were on view which had been grown in New Zealand from seed supplied by Messrs. Harrison. The quality was excellent. Harrison's Victoria Late White broccoli is worthy a special note, it being a really good variety, and was in fine condition at this late date; an excellent thing to carry one through to the early cauliflower season.

Seasonable flowers and foliage were lavishly and tastefully used to adorn the pavilion of Messrs. Jas. Carter and Co., Holborn, who, of course, had a telling display of well-selected vegetables and farm seeds on view. Messrs. E. Webb and Sons, Wordsley, Stourbridge, adopted a bold style of grouping pelargoniums, spiræas, hydrangeas, and other flowering plants, with tall stands of melons, and dishes of various vegetables grouped on either side. The whole display was very attractive. Messrs. Dicksons, Lim., Chester, made a break from the usual array of farm seeds by utilising their space for a display of hardy flowers, carnations, primulas, etc. A batch of Ribes sanguinea Brocklebanki, a new and effective shrub with pale greenish yellow foliage, was very attractive as shown by Messrs. Dicksons, who are introducing it to commerce.

A series of small semi-circular groups of flowering plants and cut flowers occupied the foreground of Messrs. Toogood's stand. The Southampton firm had also excellent asparagus, tomatoes, etc. Grasses and clovers were the main feature of Messrs. Clibrans' display—both seeds and specimen stems, correctly named, were shown, and the exhibit was a very interesting and instructive one. Messrs. Dickson, Brown, and Tait, Manchester, used liliums and rambler roses to good effect, and the plumose varieties of nephrolepis were also freely used as setting. In addition to massive roots and the usual farm seeds, Messrs. Dickson and Robinson, Manchester, made a bold show with flowering plants and foliage. Irises and liliums, with pyrethrums and other bright subjects were well represented.

Gardeners' Royal Benevolent Institution.

The seventy-first annual festival dinner of this wonderful, well-managed, and extremely useful horticultural charity, was held on June 22 at the Whitehall Rooms, Hotel Metropole, under the very genial presidency of the Hon. Harry Lawson, M.P. There was a good attendance, those present including such prominent horticulturists as Messrs. H. J. Veitch, J. E. Veitch, N. N. Sherwood, E. Sherwood, W. Sherwood, W. A. Bilney, G. Paul, G. Bunyard, G. Monro, O. Thomas, D. Ingamells, H. B. May, J. Douglas, C. Fielder, W. Poupart, C. Jefferies, W. Barr, G. Barr, T. Rochford, J. Walker, W. Iceton, Edward White, J. Vert, J. Heal, G. J. Ingram, etc., with such well-known public men as Colonel Lockwood and Sir Walter Smythe.

In rising to propose the toast of the evening, "Success to the Gardeners' Royal Benevolent Institution," the Chairman was warmly received. He observed that all charity was fragrant, especially when associated with the saving grace of thrift, as was the G. R. B. I., as fragrant as the flowers its friends cultivated, while its fruits were unfailing. We are all gardeners, or we like to pretend we are gardeners; but whatever our claim may be we who love gardens and gardening have been the means of making our country foremost in utility and beauty—literally the garden of the world. He said he could view the charity without bias, and asserted that gardening was the diversion of all others to be preferred, and none had done so much to impress upon the public the love of flowers as the late Dean Hole. He loved the old true English style of gardening, and did all in his power to extend the love of flowers. The Chairman said that one of the pleasing things of modern times was the development of window and home gardening, even in the mean streets of the east of London, where gardening of any kind was carried on under the most unpropitious conditions. But it was the difficulties of our climate that had brought out all the finest qualities of gardeners, and so in spite of climate and other difficulties, we stood foremost as a race of gardeners. He admired the great extension of window gardening in towns, and the growing love of flowers and fruits in the daily life of our times. Local authorities now helped by providing trees and flowers in parks and streets; and there was a delightful competition between the Royal and the L.C.C. Parks, in the provision of beautiful open spaces and public gardens in the Metropolis. He looked forward to the time when every street without its trees and flowers would be black-marked on the local map. Even the general press now took up gardening, and had its column on gardening matters. Years ago Charles Dickens presided at one of the festival dinners, and in his inimitable manner, spoke of the influence of gardening: since then horticulture had advanced wonderfully, and those who had advanced it were those for whom the G.R.B.I. was founded to render help in time of need. Gardeners grew old, they suffered from disease or misfortune, and then this charity came to their help, for gardeners were also among the first to suffer in times of public stress, as they had no great organisation, as had the miners, to voice their wants and grievances, therefore they had to grin and bear their troubles. But the charity they were met to help did help those who were incapacitated, and also the widows of gardeners who had fallen by the way. The institution had 143 male pensioners and 97 widows on its funds, and these were dependent on the institution for their maintenance. The total expenditure on pensions had been £130,000, and the yearly expenditure was £4,000, and only £1,000 of this was assured income, for the rest the committee depended upon the kindness of those present. He wished his words were golden, or would all come back to him in the shape of £1 sterling; and if they would, he would keep on until they had to smother him with the flowers on the tables. But, he concluded, I do want you to make this evening a notable one in the annals of the charity by giving as liberally as possible.

Mr. Harry J. Veitch, the treasurer, responded, and in his sympathetic manner he placed before the gathering the aims and claims of the institution. He thanked the chairman heartily for his presence, his influence, and his speech. He referred to the Victoria Era and Good Samaritan Funds that so greatly helped waiting candidates for pensions, but those who had in some way assisted the charity in their good times were those who received the greatest assistance while thus waiting. Mr. Veitch referred to the good work of the auxiliaries and the large sums of money they gathered for the funds of the institution. He concluded by reading several pathetic letters of thanks from those who had been helped by the institution, and asking for the greatest possible assistance for the gardeners who were in great distress and need.

"Horticulture in All its Branches" was ably proposed by Mr. E. A. Ebblewhite, clerk of the Gardeners' Company, and responded to by Mr. N. N. Sherwood, V.M.H., and Mr. Alderman Piper, the latter of whom trod on dangerous political ground, and urged that excessive taxation and excessive competition were the cause of depression in commercial horticulture. Mr. Piper spoke at great length, and caused a great deal of excitement, and there were cries of "Time," "Sit down," and counter-cries of "Go on." It was an eloquent and witty speech, but one more suited for a political meeting than the festival of a great gardening charity.

"Our Chairman" was admirably proposed by Colonel the Right Hon. Mark Lockwood, M.P., and was delightfully acknowledged by Mr. Lawson, who suggested that horticulture should have its own representative in Parliament, and that Alderman Piper might well be that representative. The subscription list showed a total of £1,900, and included such contributions as: The chairman, 100 guineas; Messrs. Rothschild, 100 guineas; Mr. N. N. Sherwood and his sons, £100 and £25 to the Good Samaritan Fund; Mr. Arthur W. Sutton, £100, and £20 to the Good Samaritan Fund; Mr. Ebblewhite (collected), £106; Mr. H. J. Veitch, 25 guineas; Messrs. J. Veitch and Sons, 25 guineas; Mr. Mackellar, £30; Mr. D. MacDonald, £30; Mr. A. Waterer, £21; Mr. C. Fielder Salomans, 20 guineas; Mr. J. Douglas, £18; Mr. Porteous, £11; Mr. David Thompson, £13; Mr. H. G. Cove, £15; and Mr. Lane, £13. There were a large number of contributions of £10 and of £5, the generous Covent Garden friends, under the stewardship of Messrs. G. Monro and D. Ingamells, contributed a total of £200. The total sum was received with cheers.

The musical arrangements were again in the capable hands of Mr. Schartau.

The tables and the famous rooms were delightfully decorated by Mr. Bedford, of Gunnersbury House Gardens, with flowers and plants given and loaned by the leading London nurserymen. The meeting concluded with a kindly reference to the work of Mr. G. J. Ingram, the indefatigable secretary of the institution, now happily restored to health.

Richmond, JUNE 29.

The thirty-sixth annual flower show of the Richmond Society was held in the Old Deer Park on the above date, and was one of the very finest ever held in this famous and beautiful riverside town. Roses were magnificent, and the competition throughout the show was so keen that judging did not finish until after two o'clock, and it was not possible to obtain the awards to non-competitive displays when our representative had to leave at three o'clock. There were five large marquees, and all were well filled with excellent produce. The trade displays were a fine feature, and these, with the roses, made the show worthy of great praise. The weather was not of the best, squalls of wind and rain being interspersed with brilliant sunshine throughout the morning.

GROUPS AND PLANTS.

Mr. H. Burfoot, gardener to Lady Waechter, Terrace House, Richmond Hill, was the only exhibitor in the large group class, and he was awarded first prize for a pretty arrangement of liliums, campanulas, pink spiræas, crotons, gloxinias, odontoglossums, etc., lightly displayed. In the small group class first prize fell to Mr. H. A. Stiles, gardener to W. S. Bailey, Esq., Poulett Lodge, Twickenham, for a fairly good exhibit, in which liliums and crotons figured prominently. Mr. H. Hicks, gardener to C. M. Bartlett, Esq., Uplands, East Sheen, second; and Mr. Redwood, gardener to Mrs. Fitzwygram, Larkfield, Hampton Hill, third.

Six palms proved a good class, as fine specimens were shown, and here Mr. Stiles led the way with clean kentias, cocos, and latanias. There was but one set of six orchids, and these, from Mr. Howard, gardener to H. Little, Esq., Baronshalt, Twickenham, were awarded a first prize; Cattleya Mendeli, Lælia tenebrosa, and Cypripedium superciliare were the most conspicuous plants.

Caladiums were well shown, Mr. Lawrence, Stawell House Gardens, Richmond, scoring for six specimens with beautiful examples; Mr. H. Hicks, second, and Mr. A. Allum, gardener to Lionel Warde, Esq., Petersham House, Petersham, third. Fuchsias were delightfully well shown, and Mr. W. H. Keary, gardener to Mrs. Cooper Coles, Hedingham House, Twickenham, led for six specimens, with elegant, free-flowered pyramids; Mr. H. Lawrence, second, and Mr. H. Redwood third. Begonias were good, and there was a keen competition in the class for six specimens, the prize-winners being Mr. W. J. Hill, gardener to G. Aitkens, Esq., Manaton, East Sheen, who showed singles; Mr. T. Rabbitt, gardener to W. Edwardson, Esq., Bellari, Sidcup, and Mr. Keary.

Coleuses were another good feature, and here Mr. Hicks scored with half a dozen brilliantly coloured low pyramids; Mr. A. Allum second, and Mr. Quarterman, gardener to A. Burton, Esq., Mooresfort, East Sheen, third. Mr. Lawrence scored for three variegated aspidistras in a popular class, with Mr. Burfoot second. First prize for nine streptocarpuses was won by Mr. J. Hill with very freely-flowered specimens; Mr. T. Quarterman second with better varieties but not such good plants; Mr. Burfoot, third. Mr. Keary led for nine gloxinias, with Mr. Quarterman, second. Mr. T. Stevenson led for six table plants with very neat and well-grown examples; twelve entries.

In Messrs. Sutton and Sons' class for six gloxinias, Mr. Chart, gardener to C. R. Bennett, Esq., Darly Lodge, Sunbury, was easily first with splendid plants, one carrying thirty-six beautiful flowers; Mr. W. J. Hill a good second, and Mr. H. Hicks third.

ROSES.

The great rose class at Richmond is for forty-eight trebles, and the chief award is the Gunnersbury Park Cup, which this year falls to Messrs. D. Prior and Son, Colchester, for a grand display of large, full flowers, a few slightly weather-stained; the leading varieties were Lyon Rose, Countess of Annesley, Mrs. Sharman Crawford, Caroline Testout, Bessie Brown, Liberty, Mrs. J. Laing, Yvonne Vacherot, Mrs. W. J. Grant, Killarney, Mdme. Jules Gravereaux, and Mrs. Theodore Roosevelt; second prize fell to Messrs. Frank Cant and Co., Colchester, and third to Messrs. B. R. Cant and Sons, Colchester. There were eight competitors in the class for twenty-four trebles, and these made a superb display, Messrs. Frank Cant and Co., Colchester, winning with lovely blooms of Lyon Rose, Mrs. W. J. Grant, General Jacqueminot, Mrs. J. Laing, Mrs. Theodore Roosevelt, S. M. Rodocanachi, Bessie Brown, etc.; Messrs. D. Prior and Son second, and Mr. George Prince, Longworth, third. For a dozen blooms of one variety Messrs. R. Harkness and Co., Hitchin, led with Mrs. J. Laing in fine condition; Messrs. D. Prior and Son second with Lady Ashtown, and Mr. George Prince third with the Lyon Rose; sixteen competitors.

For a dozen blooms of a tea rose, Messrs. D. Prior and Son scored with Mdme. Jules Gravereaux; Messrs. B. R. Cant and Sons second with the same variety, and Mr. Drew, Longworth, third, with Comtesse de Nadaillac. In a special class for a dozen blooms Mr. Chas. Turner, Slough, led with a good box, in which Lyon Rose and Frau Karl Druschki figured finely; Messrs. G. and W. H. Burch, Peterborough, second, and Mr. G. Prince third. Mr. C. Turner was first for twelve trebles with a good set, in which Sultan was grandly coloured; Mr. H. Drew second, and Messrs. G. and W. H. Burch third. Mr. C. Turner also won the special prize for six bunches of garden roses; Messrs. W. and J. Brown second, and Mr. Prince third. In the amateurs' class for twenty-four blooms Mr. E. J. Holland, Sutton, scored, and he had good blooms of Mildred Grant, Frau Karl Druschki, Dr. André, Mrs. Myles Kennedy, and Mrs. Theodore Roosevelt; Mr. W. R. Hammond, Grovelands, Burgess Hill, second, and Mr. W. C. Romaine, Old Windsor, third.

CUT FLOWERS AND DECORATIONS.

Sweet peas were largely shown, and some few of the exhibits were excellent. In the class for six varieties, two dozen spikes of each, there were eleven competitors, and first prize fell to Mr. G. Baldwin, gardener to A. W. Perkin, Esq., Greenford Green, Harrow, for Asta Ohn, Maroon Paradise, Evelyn Hemus, Clara Curtis, Constance Oliver, and Sunproof Crimson; Mr. W. Mousley, West View, Ashford, second; and Mr. W. Chart third. There were seven competitors in the class for nine bunches of sweet peas, distinct, and here Mr. Baldwin was again first, his Frank Dolby being very fine; Mr. T. H. Bolton, Exeter, second; and Mr. Mousley third. Mr. C. Howe and Mr. W. Cook, Holmsley, Richmond, were first and second respectively for nine bunches in a class provided by Mr. H. Eckford. In Messrs. Webbs' class Messrs. Bolton and Groom were placed first and second.

There were two competitors in the class for two dozen bunches of herbaceous flowers, and here the awards were made in order to Mr. A. Allum, who had fine bunches of Gladiolus The Bride and Colvillei roseus, delphiniums, and liliums; and Mr. F. Gower, gardener to the Rev. W. H. Oxley, The Vicarage, Petersham.

Mrs. A. Robinson, Northyrst, Thornton Heath, was awarded first prize for a table decoration of liliums, francoa and yellow privet sprays; Mrs. Rapley, Warblington House, Harrow, second with sweet peas; and Mrs. A. R. Bide, Farnham, third. Mrs. Robinson scored also for two stands of flowers with Mdme. Abel Chatenay roses, and was first for buttonholes. Messrs. Lewis and Co., Richmond, had the best basket of roses, and Messrs. W. and J. Brown, Peterborough, the best bouquet, composed chiefly of orchids. For a basket of flowers Mrs. F. P. Wood, Broom Lodge, Weybridge, was first with golden Spanish irises.

VEGETABLES AND FRUITS.

In Messrs Webb's class for six kinds of vegetables, Mr. T. H. Bolton, gardener to the Earl of Devon, Powderham Castle, Devon, was a comfortable first with splendid Defiance Intermediate carrots, Stourbridge Marrow peas, etc.; Mr. T. J. Broom, gardener to Miss Langworthy, Gay's House, Holyport, second; and Mr. H. Keene, Queen's Road, Richmond, third. Mr. T. J. Broom was first for twelve kinds, followed by Mr. E. Montague, gardener to Colonel Biddulph, Grey Court, Ham, and Mr. R. Keen. In Messrs. J. Carter and Co.'s class for nine kinds Mr. T. Stevenson, gardener to E. A. Mocatta, Esq., Woburn Place, Addlestone, scored over Mr. J. T. Broom and Mr. T. Howe, gardener to G. T. Biddulph, Esq., Douglas House, Petersham. In Messrs. Veitch's class for six kinds, Mr. J. T. Broom was first, with Mr. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park, Woldingham, second.

There was a comparatively small display of fruit. Mr. Lintott led for three bunches of black grapes with finely-coloured Prince of Wales; Mr. Thompson, gardener to Messrs. W. and E. Wells, Hattonhurst, Hounslow, second with Black Hamburgh. Mr. Lintott also scored for white grapes with fair clusters of Foster's Seedling. Mr. Thompson led for a dish of peaches with Condor, and he also had the best two dishes of strawberries, showing Bedford Champion and Laxton's Leader in grand style; Mr. C. Howe second.

NON-COMPETITIVE.

Messrs. Jarman and Co., Chard, showed their charming Sweet Sultans, and Messrs. Kelway and Son, Langport, put up a collection of handsome and enormous branching spikes of splendid delphiniums. Messrs. W. Cutbush and Son, Highgate, were represented by perpetual and Malmaison carnations. Messrs. Bakers, Wolverhampton, had a fine lot of irises, delphiniums, gaillardias, and Gladiolus Colvillei in great sheaves. Mr. C. F. Waters, Balcombe, made up a very attractive group of perpetual carnations, showing Cecilia and Edith Waters in good form. Messrs. T. S. Ware, Lim., Feltham, contributed a bright display of double and single begonias, cut flowers on boards, backed up by large bunches of delphiniums, English irises, and other popular hardy flowers. From Wem, Salop, Mr. Henry Eckford brought up a fragrant and bright collection of sweet peas, putting up Helen Lewis, St. George, Etta Dyke, Jeannie Gordon, Queen Alexandra, Constance Oliver, Mrs. C. W Breadmore, G. Stark, Countess Spencer, Frank Dolby, and Clara Curtis in excellent condition. Mr. W. J. Unwin, Histon, was another large exhibitor of sweet peas, and showed his specialities Edna Unwin, Gladys Burt, Eric Harvey, Mrs. R. Hallam, Mrs. W. J. Unwin, and Freda Unwin, with Clara Curtis, Constance Oliver, and Mrs. Hardcastle Sykes.

Messrs. W. Paul and Son, Waltham Cross, submitted a box of their lovely new rose Juliet, and this was a centre of attraction by reason of its golden-orange colouring. Mr. W. H. Page, Tangley Nursery, Hampton, was represented by a fine group of beautifully-grown perpetual carnations in popular varieties, associated with grand sheaves of Lilium tigrinum and L. longiflorum, the whole backed by Dorothy Perkins, Blush Rambler, and Hiawatha roses. Messrs. G. Jackman and Son, Woking, exhibited show and garden roses and hardy flowers in pleasing fashion; and Messrs. W. and J. Brown, Peterborough, had a very effective, though slightly formal display of garden roses.

Mr. W. Thompson, Sheen Nurseries, Richmond, put up an effective group of palms, hydrangeas, and pink spiræas. A beautiful group of elegant ferns from Messrs. H. B. May and Sons, Edmonton, was generally admired; the plumose nephrolepises were finely represented, and Platycerium alcicorne majus with its dark green fronds was conspicuous. Mr. R. L. Russell, Richmond, was a very large exhibitor of stove foliage plants, and had a series of seven semicircular grouplets, in which alocasias, caladiums, crotons, heliconias, palms, and aralias were prominent and good. Mr. H. E. Fordham, Twickenham, showed gloxinias and liliums very prettily over a base of maidenhair ferns.

Messrs. Jas. Veitch and Sons' exhibit was of rambler and other roses in pots.

Messrs. Webb and Sons, Wordsley, Stourbridge, contributed a large and very attractive display of gloxinias, hydrangeas, liliums, and sweet peas, with a fine lot of their specialities in melons, tomatoes, beans, peas, potatoes, cauliflowers, carrots, and other products skilfully grown and finely displayed. Messrs. Stuart Low and Co., Enfield, showed roses and carnations, and Mr. K. Thirkildsen, Old Southgate, N., contributed roses.

Horticultural Club.

CLOUDS, RAIN, RIVERS, ETC.

After the usual monthly dinner of this club, held at the Hotel Windsor on the 21st ult., Mr. C. E. Shea presiding, Mr. Charles T. Druery, V.M.H., F.L.S., opened a discussion by reading three papers, the first on "Clouds, Rain, and Rivers," while the etc. embraced "Jack Frost and His Work," and finally, as affording a better opening for discussion proper, "Variation, and what we owe to it." The first paper dealt as fully as was practicable within the limited time available, with the wonderful system of water circulation which prevails on the earth's surface and in the atmosphere surrounding it. It is this latter which is constantly engaged in transferring water lifted by solar evaporation in the torrid regions of the equator to the cooler regions north and south of it. This water exists in several forms, viz., as quite invisible vapour, visible cloud formations formed by partial condensation, and in its course assumes other forms as condensation goes farther, and it becomes deposited as rain, hail, or snow, that is, as a liquid or a solid. When in any of these forms it reaches the land, part may be evaporated again, but as a rule the greater portion is absorbed by the soil, where it forms a vital contribution to plant and animal existence, and also contributes to form springs, which feed the rivers and minor affluents which carry the water back to its source, the ocean. Even where deposited as snow on mountain ranges or arctic plains, it is merely a question of time for such snows to form glaciers, and for these glaciers to creep down, melt away, and thus attain as water the self-same goal. In all these operations the water wears away and carries down with it a portion of the land it traverses, and in this way very much of the hill and dale, mountain and valley scenery has been shaped, the immediate shaping tools being the soft cloudy masses which envelop them or float in the heavens above them. Among these denudating forces the disruptive powers of freezing water come in, and hence the next paper in "Jack Frost and his Work" had its logical connection, the lecturer, however, pointed out that the popular idea of this work was a very narrow one, confined as it is to the freezing of water alone, while in point of fact, every solid owes its existence as such to temperature low enough to freeze it, since it has been demonstrated that given heat enough every solid can be melted and evaporated; while, given cold enough, every liquid, and even every gas, the very air itself, can be frozen solid. Hence we live in an environment of enormously high temperatures as regards all gases, and very low ones as regards all solids, so that frost, viewed in its wider aspects, is always with us. The final paper on "Variation and what we owe to it." evoked much interest, since it was pointed out that practically our debt is our very existence, since without the power of variation and adaptation by virtue of it, which was implanted in the primarily simple forms of life, evolution would have been impossible. From the horticultural point of view, it is marvellous what man, with his power of definite selection, has been able to do since he first became a selective factor. While unaided nature seemingly takes æons of time to effect great structural changes, man can do as much, or more, within the scope of a short lifetime to modify and utterly transform the flowers, vegetables, or fruits, to say nothing of animals, which he takes in hand, and by virtue of their innate capacity for variation, can mould almost entirely to his will. A mere weed like the cabbage is made the progenitor of many hundreds of diverse forms, most of which are, save in the flower, utterly different from the wild plant in every character. Crossing and hybridising have also come in to combine the different characters of different species, and thus increase the scope of selection, the wonderful range of tuberous begonias being especially touched upon in this connection. A hearty vote of thanks was awarded to the lecturer.

Croydon Gardeners' Outing.

One of the great privileges attaching to membership of the Croydon Society is that of being able to visit notable gardens in the district, the owners being ever ready to grant permission when application is made.

Recently about 60 members and friends paid a second visit to the gardens of Sir Everard Hambro, K.C.V.O., Hayes Place. Alighting at one of the main entrances to the gardens, an inspection under the pilotage of Mr. Grandfield, the head gardener, was soon commenced. The rock garden claimed first attention, and many interesting items were found here. Coming next to the lawns the grand specimens of sylvan beauty were much admired, as also were miniature lily ponds, with other aquatics looking promising for a good display in a few weeks' time. The photographer of the party next claimed attention, and obtained an excellent photograph of the group. On the occasion of the last visit the rose beds and garden were just at their best, and this visit being earlier in the year, one had to surmise the beauty of this picture. In the conservatory, which was next visited, the gardener's art was displayed by groups of colour. A huge geranium trained up one side with its bright scarlet colouring attracted a good deal of attention. The plant is about 30 years old, and in continuous bloom. A big area of pleasure grounds was traversed, and the bold masses of rhododendrons here and there were very striking. Following the paths around the grounds the kitchen garden was reached, and the early crops of vegetables and the herbaceous borders were full of interest.

In one secluded corner was the greatest treat of all, especially to the enthusiast of rock and alpine plants, for here were alpine gems rarely met with. Primulas of recent introduction, and saxifragas in many varieties. Earlier in the year, when Mr. Grandfield exhibited these gems at the Royal Horticultural Society, London, they won the coveted gold medal. In frames were alpines in all stages of growth, from the newly germinated seed to the bigger seedlings pricked off. Time would not allow one to dwell too long in this section, for the light was beginning to fail, and the houses had to be inspected. Carnations are evidently a favoured flower, for they are extensively grown, one method of culture being in hanging baskets. Gloxinias, streptocarpus and pelargoniums were in grand style, and much admired. By the time all had passed through the houses it was quite dusk.

Before separating a very hearty vote of thanks was passed to Sir Everard and to Mr. Grandfield and staff for the great courtesy shown. A pleasant drive home terminated an instructive and enjoyable evening.

Poor Colour of Early Roses.—I have never before noticed rose blooms so poor in colour as they are this year. I am referring, of course, to the very early developed flowers. Those of Carmine Pillar, Mrs. W. J. Grant, Mdme. Isaac Perriere, Gloire de Dijon, and Mdme. Abel Chatenay are a few amongst many that I may name. Later buds are opening much richer in colour. I think the late frosts and the excessively cold weather had much to do with this lack of colour in early blooms. Many buds fell off the trees just before they showed any colour. —G. B.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

PUNCTURED CUCUMBER LEAVES. — A., Newbury: The punctures are due to the bite of some insect; ants or weevils would do similar damage. Set traps for these pests, and examine the plants at night also.

DAMAGED PEACHES.—W. C. F., Renfrew: We submitted the last lot of fruits to examination by a mycologist, and he, like ourselves, fails to find any trace of fungus disease. The trouble is due to scorching, caused either by bad glass, or by insufficient ventilation early in the morning to dissipate the moisture condensed on the fruits before bright sunshine could scorch or scald them through the lens-like globules of water. It is just possible that spraying with some material would produce a similar effect, but scorching, as suggested, is more probably the cause. The damage is only skin deep, and will not spread unless a saprophytic fungus makes its appearance on the damaged portion.

WHITENED TREE SHOOTS.—J. H. C., no address: The tree is suffering from a very bad attack of mildew, and unless quickly relieved will suffer irreparable damage. Spray the tree with a solution of sulphide of potassium, using one ounce of the sulphide in 2½ gallons of water, with a little soft soap added to make the mixture slightly adhesive. It may be necessary to spray again in ten days' time.

SPOTS ON CELERY LEAVES.—C. L. T., Bedford: The brown spots are due to a fungus known as Septoria petroselini, a pest that is sometimes the cause of great damage to celery crops both in this country and on the Continent. The disease spreads with alarming rapidity, hence measures for its repression must be promptly taken. Remove and burn all badly affected leaves, and spray the plants with Bordeaux mixture made of 10lb. sulphate of copper and 5lb. of quicklime to 100 gallons of water. Three applications at intervals of a week usually prove sufficient to check the progress of the parasite. The injury caused is most serious when the foliage is attacked during an early stage of growth, and careful watch should be kept on the crop, especially in districts where the disease is prevalent.

LEAF RUST ON TOMATOES.—A. J. P., Sidmouth: The tomatoes are suffering from an attack of leaf rust, caused by a fungus named Cladosporium fulvum. It is capable of doing a great deal of damage, unless checked. Remove and burn all badly infected leaves, and spray the plants with a weak solution of potassium sulphide (not more than 1oz. to 3 galls. of water), or weak Bordeaux mixture, at short and regular intervals.

CATERPILLARS OF GOAT MOTH. — L. B., Stockgrove: The specimen sent is a young example of the caterpillar of the Goat Moth, a pest that does an immense amount of damage to oak, elm, ash, apple, walnut, and other trees in some localities. The moth lays her eggs in the bark crevices at the base of the tree, usually, and the caterpillars eat their way into the wood, making tunnels upwards of half an inch in diameter, and, even if the tree is not killed, the wood is absolutely spoiled as timber. The workings of the Goat Moth caterpillar are made apparent by the refuse thrown out of the bor-

STRAWBERRY NETTING I DO NOT REQUIRE PAYMENT until you have seen and approved of netting. Others may try to copy me, but my netting is similar to that supplied by us to the Royal Gardens, being extra quality small mesh, will not rot. 50 yds. by 1 yd. 2s., by 2 yds. 4s. Any width or length supplied. Orders over 5s. carr. paid. Commoner netting, 50 sq. yds. for 1s. List and samples free. H. J. GASSON, Net Works, Rye. Est. 126 years.

ings, and also by the goat-like odour that pervades the tunnels. When full fed the caterpillars are three inches or more in length, and generally of a dull yellowish colour, and, unfortunately, several of these pests are often found attacking one tree. Caterpilars, when full fed, turn into chrysalids at the mouth of their burrows, and these are reddish, appearing in June and July, hence trees known to be infested should be carefully watched during these months, and the chrysalids taken and destroyed as soon as seen. This will reduce the chance of further infestation. There is great difficulty in reaching the caterpillars in their workings, but sometimes it is possible to kill them by working a piece of stout wire into the tunnel; when the wire is withdrawn the end of it will show whether the caterpillar has been reached. A piece of india-rubber tubing may be inserted as far as possible into the tunnel, and its free end slipped over the nozzle of a syringe charged with an emulsion of paraffin and soft soap. If the mouth of the tunnel is plugged with clay round the tube, and considerable force is used to expel the mixture from the syringe, the caterpillar may be reached and killed. The emulsion should not be allowed to run back out of the tunnel.

TRAINING AND FEEDING SWEET PEAS.—M. G., Ipswich: You appear to be following correct methods, but as a standby in case of difficulties you should obtain "Sweet Peas and their Cultivation," new edition, by C. H. Curtis, post free for 1s. 2d., or 1s. 8d. (cloth), from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C.

RED SPIDER ON VINES.—R. W., West Drayton: Undoubtedly the cacti form a fine breeding ground for red spider, and from these the pest spreads to the vines. In a small garden, where so many kinds of plants have to be grown, it is always a difficult matter to arrange these grown in pots in such a way as to harmonise with each other as regards general treatment without causing any harm to permanent occupants of the houses. Pests of any kind are extremely difficult to eradicate from cacti, and the only good method is regular dipping in an approved insecticide. We do not know what kinds of cacti you grow, but probably they could all be accommodated in a cold frame at this season of the year, and be regularly dipped to rid them of red spider. Sponge the vine leaves with soapy water or a weak insecticide.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

A. S., Etwall.—Heracleum Sphondylium.

S. F. R., Chobham.—1, Leycesteria formosa; 2, Vitis Henryi.

J. H. W., Woolton.—Mimulus glutinosus, a good old garden plant, better known as Diplacus glutinosus.

F. E. C., Rusper.—1, Rondeletia speciosa major; 2, Mirabilis jalapa; 3, Tillandsia usneoides; 4, Spiræa discolor.

F. W., Gloucester.—1, Olearia Haasti; 2, Rhus cotinus; 3, Cotoneaster frigida; 4, Crataegus Lelandi; 5, Spiræa Aruncus.

J. M., Uttoxeter.—The growth sent is probably that of an acacia, and appears to be coming into flower; send again later. The rose is Cheshunt Hybrid.

J. F. C.—1, Send again, poor specimen; 2, Escallonia macrantha; 3, Tamarix gallica; 4, Spiræa Bumalda; 5, not recognised, probably a viburnum; 6, Azara microphylla.

MEXICAN CACTI.—F. P., Stoke Newington: You could obtain the information you require from Senor Don Miguel Covarrubias, the Mexican representative, 87, Cromwell Road, S.W., or from Mr. C. E. W. Stringer, H.M. Consul-General, Mexico. Either of these would put you into communication with the right people.

F. S., Redruth.—We do not recognise the variety; there are now so many rich scarlet zonal pelargoniums that unless there is opportunity for comparing growing plants, as well as flowers, it is impossible to distinguish them.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Perfumes.

There has been some remarks recently uttered in critical horticultural circles to the effect that there is too great a tendency to ignore the perfume of such flowers as the rose and carnation when judging their merits as competitive blooms. In the old days the delicate odour was regarded as one of the chief charms, but in the process of selection and improvement, richness of tints, size and make of flower, and abundance of blossom have been chiefly aimed at, and there is no doubt that in many instances the perfume has been regarded as a minor factor of attraction, with the result that in many cases it is hardly perceptible. To take the rose, however, as a case in point, there is something to be said on both sides. In the wonderful tribe of Ramblers, which at this season of the year deck our landscape gardens with rich and sometimes huge masses of colour, clustering and clinging and clambering on pergola, arch, or other accommodating structure, it is the eye and not the nose which they are designed to satisfy, and do satisfy to such an extent that it rarely occurs to the beholder to test their perfume. With such roses, on the other hand, as are cut for buttonholes or table decoration, we come, as it were, into closer personal contact, and, mindful of the reputation of the Queen of Flowers, we feel the need of both colour and odour, and regard the absence of the latter as a distinct defect. It is, too, an open question as to how far Nature's tendency to balance attractions is now evidenced in this connection. The glorious tints and massings of blossoms, or the huge size of individual blooms, are primarily designed to attract, not man's attention and admiration, but such bees, moths, or other insects, as will act as Cupid's intermediaries. The wild scented prototypes of the flowers may be, and usually are, very much smaller and less conspicuous than man's selective triumphs; and it is quite conceivable that, as the usual attraction is increased, the olfactory one, the scent, is decreased, as being less necessary for the primary object cited. If this be so, it is clear that any attempt to ally great conspicuousness with marked perfume is likely to be handicapped seriously, and it is a very open question whether strains of roses of the Ramblers or conspicuous type, which had to rely on delicious scent as a set-off for less conspicuousness and brilliancy of effect, would be greatly encouraged. With regard to the carnation, of which we may take the old-fashioned richly-scented Clove as the odoriferous type, the loss of scent in many of the up-to-date forms is to be regretted, since with this class of flower the massed effect at a distance, to which we have alluded in connection with the Rambler roses, does not come in, and one almost instinctively seeks for the old-fashioned perfume of the Clove when any of its modified relatives are to the fore. Considering the subject of perfumes from a wider point of view, they constitute a most interesting theme. First of all, there is their wonderful diversity. It may safely be said that, independently of the floral odours, every plant has its distinctive scent, either patent, such as we find in the mints and innumerable other plants, or latent in such as require to be bruised in order to evoke it. Every one of these subtle odours is the outcome of chemical decomposition and recomposition effected in the foliage by the action of light upon the chlorophyll, and the resultant building up of volatile oils, resins, and other composite bodies, capable of affecting the delicate nerves of our olfactory organs and conveying to the brain its particular impression, so that, independent of vision entirely, there are hundreds of plants which can be determined instanter by the odour alone. In all probability too, just as there are sounds too subtle for our ears to catch, there may, and indeed must, be odours of equal delicacy patent enough to the insect world or even to the larger animal world, but from which we are excluded as regards their appreciation by the comparative obtuseness of our olfactory sense. Comparatively obtuse, however, as this may be, its acuteness is yet quite beyond comprehension, for what idea can we form of nerves which can perceive the odour of musk molecules so minute that a single grain in weight can throw them off for decades or even many decades, and yet be appreciably undiminished. The odoriferous emanations from the dried rose petals gathered by our grandmother or great-grandmother still recall the living rose in the pot pourri which has been handed down from generation to generation. This, however, carries us back to our original theme, since, given continued ignoring of the rose perfume as one of the essential qualifications of awards of merit, the pot pourris of the future will undoubtedly be but poor indeed as compared with those of the past. Happily, there are in cultivation many roses whose blooms are not less remarkable for their fragrance than for their fine form and attractive colours; and raisers are fully alive to the importance of perfume, although they are not always successful in obtaining it.

REV. R. POWLEY.

Rev. R. Powley, rector of Upton Scudamore, Warminster, is a genial cleric, who is extremely fond of flowers in general and roses in particular. His grandmother inspired him with a great love for flowers and gardens, and when a lad of fifteen he devoured the then new book on roses by the late Dean Hole, and longed for the day when he would be able to grow roses of his own. The time came in 1888, when he went to Upton Scudamore, and the following year he won his first prize for roses at Warminster Show. Then he went to Bath and to Bristol, and in 1897 first showed at an exhibition of the National Rose Society; since then he has only missed one Metropolitan show (his roses were not properly out), and was so ashamed of his withdrawal on that occasion that he now exhibits whatever the state of his flowers, and bears with wonderful philosophy and good temper, his defeats. Mr. Powley's garden lies very high on the edge of Salisbury Plain, faces south, and gets every wind that blows except those from the north. The soil is cold, heavy, and chalky, not ideal for roses. He is his own gardener, save for the spade work, and he grows a few less than 500 tea roses, or 2,000 roses in all, and, as he has parish work, private pupils, and local school inspection as part of his daily duties, the number of roses grown is not likely to be exceeded. Mr. Powley does not like the big roses, and Mildred Grant is his pet aversion—this is rather interesting, especially as Mr. Powley inclines to Falstaffian proportions. He also hates the modern idea that there is only one type of rose, i.e., with a pointed centre and a regular whorl of outer petals. He regards it as absurd, and so do we, to dress Souvenir d'un Ami after the style of Mrs. Edward Mawley. We should like to see Mr. Powley conduct a vigorous crusade against the dressing of roses for exhibition purposes as it is now carried on by some growers.
